1.0 INTRODUCTION

1.1 Seneca Army Depot Activity

Seneca Army Depot Activity (SEDA) is a U.S. Army facility located in Seneca County, New York. The Depot occupies approximately 10,600 acres. It is bounded on the east by Route 96 and on the west by Route 96A. Most of the surrounding land is used for farming.

Construction at SEDA began in 1941. Its mission included reception, storage, and distribution of ammunition and explosives, GSA and strategic materials and Office of Civil Defense engineering equipment. It also included providing receipt, storage and issue of items that supported special weapons activity and performance of depot-level maintenance, demilitarization and surveillance on conventional ammunition and special weapons.

1.2 BRAC and Environmental Baseline Survey

SEDA was included on the Federal Facilities National Priorities List on July 13, 1989. In March 1995, the Base Realignment and Closure Commission (BRAC) submitted its recommendation that SEAD be selected for closure. This recommendation was subsequently approved in 1996. The Base Realignment and Closure Act requires environmental issues to be investigated, pursuant to CERCLA.

An Environmental Baseline Survey Report (Woodward Clyde, 1996) was prepared for SEDA. The EBS classified discrete areas of real property associated with the Depot, which are subject to transfer or lease, into standard environmental condition of property types. The determination that a specific property is environmentally suitable for transfer or lease is established under the FOST/FOSL guidance.

As part of continuing work after the completion of the EBS, additional sampling and analyses was necessary at selected non-evaluated sites at SEDA to determine their environmental condition. Most of the non-evaluated sites were initially identified in the EBS, however, some sites were added to the list to be evaluated because of rumor or speculation that a release(s) had occurred. The Land Reuse Authority (LRA) identified "SEAD" areas 46, 68, and 120 as moderate status, based on the need for transfer or lease of these areas. Thus, these three areas are presented in this report. Most of the "SEAD" area designations are actually composed of several individual sites, which are designated by sequential letters of the alphabet (e.g., SEAD-120A, -120B, -120C, etc.). The 12 moderate Non-Evaluated EBS sites, whose locations within the Depot are shown on Figure 1-1, are listed in the Table 1-1 (on the following page).

Note that SEAD-46 was deleted from the moderate sites to be investigated at this time, however, its current status is presented in this report.

1.3 Technical Approach for Investigation of Non-Evaluated EBS Sites

The process by which the sites within these areas were investigated is diagrammed in the Seneca Army Depot Decision Criteria Flow Chart (Figure 1-2). This flow chart provides the overall guidance for investigating and remediating sites at SEDA. The limited sampling and analysis program was designed to provide initial data so that an impact analysis could be performed. The impact analysis involved a comparison to applicable NYSDEC standard/criteria or guidance (SCG) (Soil: TAGMs; Sediment: NYS Benthic Aquatic Life/Human Health Criteria). If the

SCGs were exceeded, then a comparison to Preliminary Remediation Goals (PRG)s was performed. The type of PRG values used was based on the intended use of the property, which was established in the EBS. At SEAD-68 "Industrial PRGs" were used and at SEAD-120 (A, B, C, D, E, F, G, H, I, J) "Recreational PRGs" were used. Note that no samples were collected at SEAD-46.

The samples were collected in source areas that were believed to have been most impacted (i.e., had the highest chemical concentrations) compared to other locations within the site. The evaluation at each site included collecting a limited amount of soil and/or sediment data, as appropriate, to provide a basis of determining if the site has been environmentally impacted. Since many of these sites involved rumors, with no analytical data to support further evaluation, limited, but representative, data collection was deemed appropriate at these sites.

Table 1-1
Moderate Non-Evaluated EBS Sites

Number	SEAD Area Designation	Description	EBS Site Number
1	SEAD 46	Small Arms Range	122Q-X
2	SEAD 68	Old Pest Control Shop (Building S-335)	108(7)HS(P)/HR(P)
3	SEAD 120A	50 Area Dumping Areas	57(6)PS/PR/HR
4	SEAD 120B	Ovid Road Small Arms Range	119Q-X
5	SEAD 120C	Building 813-817 Paints and Solvents Disposal Areas	98(6)PS/HS/HR
6	SEAD 120D	MP Refueling Island in the Q	99(6)PS/PR
7	SEAD 120E	Near Building 2131, Possible DDT Disposal	106(6)HR
8	SEAD 120F	Munitions Burial Sites, South End of the Main Depot	117Q-X
9	SEAD 120G	Mounds at the Duck Pond	109(7), 110(7), 111(7), and 112(7)
10	SEAD 120H	Building 810	98(6)PS/HS/HR
11	SEAD 120I	Building 819, A0101 and A0102	98(6)PS/HS/HR
12	SEAD 120J	Farmer's Dump	Rumor

Possible outcomes of the limited sampling and analyses program Impact Analysis, as indicated on Figure 1-2, are as follows:

1. Concentrations of constituents of concern are below the NYSDEC SCG (e.g., TAGMs), suggesting that the site has not affected the environment. The site will be designated as a "no further action" site with no reuse restrictions.
2. Concentrations of constituents of concern were above NYSDEC SCG (e.g., TAGMs), therefore, comparisons to PRGs are necessary. If concentrations are less than PRGs, then additional sampling (possibly via an ESI) will be performed. If the concentrations exceed the PRGs, then a Hot Spot Analysis will be performed; this analysis will likely include additional sampling as well.

In addition, where the significance of the environmental impact is not definitive based strictly on the analytical data comparisons, professional judgment will be used to develop the final recommendations. Thus, in some instances slight exceedance of a TAGM does not automatically result in a recommendation for further investigation at the site.

In this report, the sections that describe the individual sites provide a summary of the investigation fieldwork and analytical results for each of the 12 moderate Non-Evaluated EBS sites. The tables and figures are presented at the end of the text sections for clarity. Note that the analytical data tables present comparisons to both SCGs (e.g., TAGMs) and PRGs, where applicable. The results of these comparisons are presented in "bold and shade" format (i.e., the exceedences are bolded and shaded in the tables).

1.4 Field Investigation Methods

The field investigations were performed using the methods outlined in the Generic Installation Remedial Investigation/Feasibility Study Work Plan (Parsons, 1995). There were no specific field investigation methods/procedures used that are not specifically covered in the Generic Workplan.

The analytical data included in this report has not been validated, but it will be validated in the near future, and the results/recommendations updated appropriately.

2.0 SEAD-46 - Small Arms Range

2.1 Site Information

This parcel is associated with a small arms range that was used for testing firing tracers and 3-1/2-inch rockets. This area corresponds to one of the previously identified SWMUs (SEAD-46) (Figure 2-1).

This site was originally included in the list of moderate EBS sites, but work at this site was postponed because of specific UXO concerns.

3.0 SEAD-68 - Old Pest Control Shop (Building S-335)

3.1 Site Information

This parcel is associated with the reported former pest control shop in Building S-335. This site is one of the previously recognized SWMUs (SEAD-68) (Figure 3-1). No documented or visual evidence of a release has been discovered. However, NYSDEC has classified this area as an Area of Concern (AOC) and the Seneca Army Depot Activity agrees.

The purpose of the investigation was to determine if surface and subsurface soils around the Old Pest Control Shop have been impacted by the activities at the shop. The constituents of concern are volatile organics, semivolatile organics, pesticides (including organophosphorous pesticides), herbicides, and arsenic in soil.

3.2 Summary of Investigation

This area is comprised of a 100-foot by 40-foot single story wooden building, the Old Pesticide Control Shop, which is located on the corner of Avenue C and 3rd Street (Figure 3-1). The building is surrounded on the west, north and east sides by narrow grassy areas. There are doors located on these three sides of the building. A large garage (bay) door entrance is on the southern end of the building. Beyond the grassy areas to the north and east is an asphalt and gravel (i.e., crushed shale) area that is used for vehicle parking and staging. A 50-foot concrete driveway extends from the bay door to the intersection of Avenue C and 3rd Street.

Surface soil sampling and soil borings were performed at this site. A total of five surface soil samples were collected near doorways on the outside of the building (Figure 3-1). Three of the samples were collected near three doors on the west, north, and east sides of the building. The other two samples were collected from locations to the northwest and southeast of the large garage door. Two soil borings were performed on either side of the large garage door, beyond the surface soil sample locations mentioned above (Figure 3-1). The borings were in grassy areas that are likely disposal areas because of the good infiltration in the areas and because these areas are near drainage ditches. The rationale for selecting the sample locations is provided in Table 3-1.

The results of the laboratory analyses are presented in Tables 3-2 through 3-9. These results were compared to the NYSDEC TAGMs and the Industrial PRGs. The results of the comparisons are given below.

Comparison to TAGM:

- Six volatile organic compounds were found in the soil at SEAD-68, however, their concentrations were all below their respective TAGMs. The two most frequently occurring compounds were acetone and toluene, which were present in a majority of the samples. These two compounds are common laboratory contaminants. The other compounds (benzene, chloroform, total xylenes, and trichloroethene) were found at estimated concentrations between 2 ug/Kg and 5 ug/Kg only in the two subsurface soil samples.
- The semivolatile organic compounds found in the soil samples consisted mostly of PAHs, however, five phthalates were also found in the soil samples. Four of the PAH compounds

exceeded their respective TAGMs in the surface soil samples collected immediately around Building S-335; one exceedence (1.2 times the TAGM) was found in the surface soil sample at SB68-2. The maximum exceedences for the PAHs were as follows: benzo(a)anthracene (4.1 times); benzo(b)pyrene (12.6 times); chrysene (2.5 times); and dibenz(a,h)anthracene (16 times).

- Six pesticide compounds were found in the soils at SEAD-68. They were found in all samples except for those collected at SB68-1. One of the compounds detected, 4,4'-DDT, was found at a concentration (4,000 ug/Kg) that was 2 times its TAGM in surface soil sample SS68-4, which is located outside a door on the northwest side of Building S-335. Also, three other compounds were found at their highest concentrations in this sample. The other compounds found in the samples collected on-site were 4,4'-DDE, alpha-chlordane, endrine ketone, gamma-chlordane, heptachlor epoxide.
- Two herbicide compounds (2,4,5-T and 2,4-DB) were found in one soil sample, SS68-4, which was collected outside the door on the northwestern side of the building. Both of these concentrations were well below their respective TAGMs.
- The concentrations of arsenic in were below the TAGM in all of the samples, except for one (SS68-4). In this sample the TAGM was exceedence was relatively low (1.3 times).

Comparison to Industrial PRGs:

- No Industrial PRGs were exceeded in the soil samples for the volatiles, semivolatiles, pesticides, and herbicides analyses. Arsenic exceeded the Industrial PRG in all but one of the soil samples, however, the exceedences were generally low, between 1.02 times and 3.0 times the PRG. In more than half the samples the arsenic exceedences were less than 2 times the PRG. The maximum exceedence (3.0 times) was in the surface soil sample SS68-4.

Recommendation: Based on professional judgment, and as indicated at Decision No. D in the Decision Criteria Flowchart, it is recommend that additional surface soil sampling be performed to determine the extent of the impacts from pesticides (particularly 4,4'-DDT) on the southwest side of the building at SEAD-68. At this time, there are an insufficient number of data points to perform a Mini Risk Assessment.

4.0 SEAD-120A - 50 Area Dumping Areas

4.1 Site Information

This parcel is associated with dumping areas that are reported to exist in the "50 Area" west of Seneca Road and south of Indian Creek Road (Figure 4-1). Two of the dumping areas were observed to contain concrete blocks and fill dirt. One had steel drums and one is believed to be a former railroad dump containing railroad ties and scrap metal.

The purpose of the investigation was to determine if subsurface soils have been impacted by the dumping that occurred in this area (the locations of these samples were not based upon the results of the geophysical survey). A geophysical investigation was used to identify other areas where material may have been buried. The constituents of concern are volatile organics, semivolatile organics, TPH, metals, pesticides/PCBs, and herbicides in soil.

4.2 Investigation Summary

The site is comprised of an irregularly shaped area located in the southwestern corner of the Depot (Figure 4-1). It is comprised of mostly wooded land and low brush areas, and within these areas are railroad tracks, a dirt road, open areas and soil/debris mounds. Most of the woodlands are located in the central and southwestern portions of the site, and the remaining areas are dominated by low brush. A railroad line passes through the southern portion of the site and extends north through the north-central portion of the site; a dirt road parallels the railroad tracks that pass through the southern portion of the site. Several conspicuous, open areas are located on the eastern and western sides of the railroad tracks (in the western portion of the site), where they begin to head due north toward Indian Creek Road. The areas are generally lower in elevation than the surrounding terrain near the roadway and railroad tracks, and they are characterized by uneven ground. In addition, soil/debris mounds were identified along the perimeter of the site, near roads or railroad tracks. No roads that would provide access to interior locations of the site were identified during the inspection.

EM-31 geophysical surveys were performed to identify locations where oil or hazardous materials may have been buried. The geophysical surveys were performed in six different areas within site 120A. These locations were chosen because they are suspected staging areas or conspicuous open areas where access is provided to them by nearby roads and/or railroad tracks. These locations were identified based on a review of aerial photographs, site inspection information, and discussions with SEDA environmental personnel. Areas 1 and 2 are to the west and east of the railroad tracks, respectively, where the tracks begin to head due north toward Indian Creek Road. Areas 3 and 4 are located east of the railroad tracks, to the south and north, respectively, of the small pond that was associated with the munitions washout facility (SEAD-4). Area 5 is located near Seneca Road west of igloo E0801. The last area (Area 6) is located west of Silver Creek, approximately 500 feet south of igloo E0806.

An EM-31 survey was performed in the six different areas as previously described. All of these areas are believed to have been the most likely to have been used for disposal purposes, if disposal actions have actually occurred in SEAD-120A. The EM-31 survey was performed at each location by collecting EM measurements every one second along parallel survey lines. These lines were spaced 20 feet apart. The local survey grid that was established at each location was surveyed and referenced to the New York State Plane coordinate system. Once the EM-31 data were collected, they were corrected for instrument drift using instrument function check data that were collected before and after each survey. Finally, the data were reduced to produce pseudo-color maps of the measured EM responses. These maps are presented in Figures 4-2 through 4-9. Figures 4-2, 4-4, 4-6 and 4-8 show the measured apparent ground conductivity at the various survey locations, and Figures 4-3, 4-5, 4-7 and 4-9 show the measured in-phase response. In each figure, the range of measured values has been mapped to an arbitrary color scale, which was chosen to highlight the variations observed in the EM data.

No EM anomalies are visible in either the apparent ground conductivity data or in the in-phase response data at any of the six areas surveyed. At each surveyed area, the apparent ground conductivity and in-phase response data are interpreted to be representative of natural site conditions. There are no indications that disposal of metallic debris has occurred at any of the six areas, nor is there any indication of soils with increased or decreased apparent ground conductivities that may have been caused by leaching or run-off from disposal materials.

A total of five test pits were performed within the site and two soil samples were collected at each test pit (Figure 4-1). The samples were collected at the locations of soil/debris mounds near roads and railroad tracks, which are areas that would allow easy access for dumping; these locations were not based on the results of the geophysical survey, which investigated material that may have been buried. The mounds that were investigated were those that were the most easily accessed and had signs that they contained debris (anything other than topsoil). The degree of accessibility, as well as the relative amount and type of debris in the mound, were the main criteria for choosing the mounds to be investigated. The rationale for selecting the sample locations is provided in Table 4-1.

The results of the laboratory analyses are presented in Tables 4-2 through 4-11. These results were compared to NYSDEC TAGMs and Recreational PRGs. The results of the comparisons are given below.

Comparison to TAGMs:

- No volatile organic compounds were found at concentrations above their respective TAGMs. The volatiles that were found included acetone, chloroform, methylene chloride, and toluene, most of which were found at estimated concentrations in the samples
- The semivolatile organic compounds detected in the soils on-site were mostly PAHs and phthalates, however, none of these compounds were found at concentrations above their respective TAGMs. The concentrations for all of the semivolatile compounds were estimated. The PAHs, which comprised the majority of the compounds detected, were found mostly at TP120A-2 and TP120A-5.
- No TPH were found at concentrations above the detection limit at four of the five test pit locations; at one test pit location, TP120A-2, no TPH sample was collected due to an oversight in the field. No TAGM has been established for TPH.
- Five metals exceeded their respective TAGMs, however, these exceedences were mostly in the two samples collected at TP120A-2. The metals that exceeded the TAGMs were chromium (1.05 times), copper (1.7 times), iron (1.2 times), lead (2.8 times), and thallium (2.4 times). The magnitude of these metals exceedences suggests that they may be due to the natural variability of the concentrations of these metals in the soil.
- Four pesticide compounds were found at two test pit locations at SEAD-120A, however, the detected concentrations were well below their respective TAGMs. Estimated concentrations of 4,4'-DDT were found at TP120A-3 and TP120A-5. The subsurface soil sample at TP120A-5 also contained the compounds alpha-BHC, Delta-BHC, and Gamma-BHC (Lindane). No PCBs were detected in the samples.
- No herbicides were detected in the soil samples collected from the test pits in the mounds.

Comparison to Recreational PRGs:

- No Recreational PRGs were exceeded in the soil samples analyzed for volatile organics, semivolatile organics, metals, pesticides/PCBs, and herbicides.

Recommendation: Based on professional judgment it is recommended, as outlined under Decision No. B in the Decision Criteria Flowchart, that the final actions at SEAD-120A include: 1) a no action SMWU designation on all applicable permits and 2) that regulators be notified by AOC that the site will be designated as no further action with no reuse restrictions.

5.0 SEAD-120B - Ovid Road Small Arms Range

5.1 Site Information

This parcel is associated with the location of a small arms range. Interviews during the 1995 EBS indicated that this area had been used a small arms range. During the EBS fieldwork, a visual inspection of the area revealed a 250-foot-long arcuate berm with a dirt track road leading to it (Figure 5-1).

The purpose of the investigation was to determine if subsurface soils in the former small arms range have been impacted by the activities at the range. The constituents of concern are semivolatiles, metals, and explosives in soil.

5.2 Investigation Summary

The site is comprised of a 200-foot long arcuate soil berm that opens to the southwest (Figure 4-1). There is an approximately 290-foot dirt road that leads from the patrol road to the base of the berm, which is covered with brush and vines. At the base of the berm, beneath the brush, there are three steel posts that are believed to be the supports for target mounting frames. Three buried 4-inch diameter clay pipes (which protruded a few inches above the ground surface) were also found at the base of the berm. Because these locations correspond with the identified target backstop locations, they may have been used as removable target post receptacles.

A total of six soil samples were collected at locations behind each of the target locations within the berm (Figure 5-1). The samples were collected at locations immediately behind the target posts; these locations are believed to be impact points for the shots. The impact points were verified by the presence of bullets, mostly copper jacketed 0.45 and 0.38 caliber, which are typically used with sidearms. There was also evidence of more recent activity at this site because two plastic ammo boxes and a 6-foot belt of live 5.56 NATO blank rifle rounds were found in front of the berm. Manufacturer markings and a lack of corrosion on these materials suggests that they are likely to be only 4 to 5 years old. The rationale for selecting the sample locations is provided in Table 5-1.

The results of the laboratory analyses are presented in Tables 5-2 and 5-7. These results were compared to NYSDEC TAGMs and Recreational PRGs. The results of the comparisons are given below.

Comparison to TAGMs:

- No explosive compounds were detected in the samples collected from the soil berm.
- Semivolatile organic compounds were found at estimated concentrations in the soil samples. The compounds included many PAHs and two phthalate compounds. None of the detected concentrations were above the TAGMs.

- Four metals exceeded their respective TAGMs. Lead was the only metal that exceeded the TAGM in all six sample locations. Samples from test pits TP120B-1 and TP120B-2 had lead concentrations that were in the several hundred parts per million. The maximum concentration for lead was 522 mg/Kg at TP120B-2, which is 21 times the TAGM. Copper was the next most frequent metal to exceed its TAGM in the samples. The exceedences for copper, which ranged from 1.7 times to 6.4 times, were found at test pits TP120B-1 and TP120B-2. The other two metals, arsenic and thallium, exceeded the TAGM in only a few samples and the exceedences were relatively low compared to those of lead and copper.

Comparison to Recreational PRGs:

- No Recreational PRGs were exceeded in the soil samples analyzed for explosives, semivolatile organics, and metals.

Recommendation: Based on professional judgment, and as indicated at Decision No. D in the Decision Criteria Flowchart, it is recommend that additional surface soil sampling be performed to determine the extent of the impacts from metals (particularly copper and lead) at SEAD-12OB, the Ovid Road Small Arms Range. At this time, there are an insufficient number of data points to perform a Mini Risk Assessment.

6.0 SEAD-120C - Building 813-817 Paints and Solvents Disposal Areas

6.1 Site Information

This parcel is associated with five buildings in the Q area (Figure 6-1). Buildings 813 and 814 were used for storage and Building 815 was used as a paint shop. Extensive amounts of paint and solvents were used and stored in these facilities. There was no visible evidence of spills or leaks in these buildings during the 1995 EBS inspection. However, interview conducted during the 1995 EBS revealed that unknown quantities of paints and solvents were disposed of into the drainage ditch that flows north, immediately east of Building 813.

Buildings 816 and 817 were associated with a classified mission. The majority of Building 816 was not available for inspection during the EBS. Interview with a radiation protection officer revealed that a potential release of radionuclides occurred within the area of these buildings. Two radiation screening rooms, both with venting leading directly outside the buildings, were also observed. Aerial photograph analysis during the 1995 EBS also revealed disturbed ground directly west of Building 816. A visual inspection of this area during the 1995 EBS confirmed that the area was disturbed. Interviews and records searches did not confirm or deny that burial activities had occurred in this area.

6.2 Investigation Summary

No sampling was conducted at this site (Buildings 813-817) because it is being investigated under the SEAD-12 RI/FS program.

7.0 SEAD-120D - MP Refueling Island in the Q

7.1 Site Information

This parcel is associated with a former Military Police (MP) refueling station located northwest of Building 810 (Figure 7-1). According to the EBS report, two above ground storage tanks (SRNs 50 and 51), which date to 1963, are presently located behind Building 810. Both of these tanks had a 550-gallon capacity and were used to store fuel oil. A visual inspection during the 1995 EBS did not reveal any staining or stressed vegetation. However, interviews with base personnel during the EBS revealed that the MPs fueled their vehicles in this area on daily basis. Interviewees were certain that they had witnessed frequent spilling of petroleum products.

According to SEDA personnel interviewed for this investigation of the moderate EBS sites, the MP refueling island is located approximately 250 feet northwest of Building 810 and, thus, the two above ground fuel oil storage tanks (SRNs 50 and 51) behind Building 810, which were mentioned in the EBS report, were not part of the MP refueling island. According to SEDA personnel, these two tanks are currently located behind Building 810, but they are scheduled to be removed later in 1998.

The purpose of the investigation was to determine if soils near the refueling island have been impacted by contaminants. The constituents of concern are volatile organics, semivolatile organics and TPH in soil.

7.2 Investigation Summary

This site is comprised of a 100-foot by 50-foot former pumping island located at the intersection of the "Q" Patrol Road and Service Road #1, approximately 250 feet northwest of Building 810 (Figure 7-1). A 2,000-gallon gasoline underground storage tank and pumping station were located on this island to provide MPs with fuel for their vehicles if an extended "Q" area lock-up occurred. The underground storage tank and pump were removed in approximately 1988. The island is presently covered with low grass, low brush and gravel.

Two surface soil samples were collected from locations on the island (Figure 7-1). Also, one soil boring was performed on the western (downgradient) portion of the island; the groundwater flow direction is expected to be to the west based on the westwards slope of the ground surface in the area of the refueling island. The rationale for selecting the surface soil and soil boring locations is provided in Table 7-1.

The results of the laboratory analyses are presented in Tables 7-2 through 7-5. These results were compared to NYSDEC TAGMs and Recreational PRGs. The results of the comparisons are given below.

Comparison to TAGMs:

- Two volatile organic compounds, acetone and toluene, were detected in the soil samples. However, none of the concentrations of these volatiles were found above their respective TAGMs; while acetone did exceed the TAGM in one sample, its concentration in the duplicate sample was well below the TAGM. Both acetone and toluene are potential laboratory contaminants.

- The semivolatile organic compounds detected in the samples included mostly PAHs and three phthalate compounds. Two of the PAHs, benzo(a)pyrene and dibenz(a)anthracene, exceeded their respective TAGMs in soil. The exceedences for these compounds were found in both surface soil samples, however, only dibenz(a,h)anthracene exceeded the TAGM in the surface soil sample taken at the soil boring. The magnitudes of the two PAH exceedences were generally between 1.2 and 1.6 times in the samples, however, in the surface soil sample at SS120D-2 the exceedences were 3.3 times and 6.6 times the TAGM.
- TPH were found in the two surface soil samples and the surface sample collected at the soil boring; TPH was not found in the subsurface sample at the soil boring. The concentrations detected ranged from 43.6 mg/Kg to 181 mg/Kg. There is no TAGM for TPH.

Comparison to Recreational PRGs:

- None of the concentrations of volatile organics and semivolatile organics exceeded established Recreational PRGs.

Recommendation: Based on professional judgment, it is recommended that final actions for SEAD-120D, as outlined under Decision No. B in the Decision Criteria Flowchart, include: 1) a no action SMWU designation on all applicable permits and 2) that regulators be notified by AOC that the site will be designated as no further action with no reuse restrictions.

8.0 SEAD-120E - Near Building 2131, Possible DDT Disposal

8.1 Site Information

This parcel is associated with debris east of Booster Station 2131 and a possible DDT disposal area (Figure 8-1). This area corresponds with one of the previously identified SWMUs (SEAD-58). An ESI conducted by Engineering Science, Inc. indicates that the soils, groundwater, and surface water have not been impacted by any of the constituents for which analyses were conducted. The sediment in the drainage swales in the area is the only medium that has been impacted by releases of PAHs.

The purpose of the investigation was to use geophysics to locate an area that is the possible DDT disposal area and to determine if soil in this area has been impacted by pesticides. In addition, impacts to sediment in nearby drainage ditches were investigated. The constituents of concern are pesticides in soil and sediment.

8.2 Investigation Summary

This site is associated with Booster Station 2131, which is near the western boundary of the Depot (Figure 8-1). A visual inspection of the area verified the debris pile to the east of the building, which was described in the EBS report. The pile consisted of gravel and construction debris. Many underground utilities are located in the area immediately surrounding the building. A mowed area, which has traces of construction debris (e.g., scrap piping, lumber, concrete fragments) on the ground surface, extends approximately 50 feet north of the access road to Building 2131. The mowed area is bordered on the north side by a drainage ditch that is next to thick woods. The drainage ditch appeared to collect water from areas near Building 2131 and discharge it both to the east, toward a small brook, and to the west, toward another ditch along

West Patrol Road. Surface water in the ditch along West patrol Road appeared to flow south along the road and discharge into Kendaia Creek.

An EM-31 survey was performed over an area approximately 200 feet long by 200 feet wide, located in the area surrounding Building 2131. This area is suspected to have been the site of DDT disposal. The EM-31 survey was performed by collecting EM measurements every one second along parallel, north-south oriented survey lines. These lines were spaced 20 feet apart. The local grid system that was used to reference the EM-31 survey was surveyed and referenced to the New York State Plane coordinate system. Once the EM-31 data were collected, they were corrected for instrument drift using instrument function check data that were collected before and after the survey. Finally, the data were reduced to produce pseudo-color maps of the measured EM responses. These maps are presented in Figures 8-2 and 8-3. Figure 8-2 shows the measured apparent ground conductivity and Figure 8-3 shows the in-phase response. In each figure, the range of measured values has been mapped to an arbitrary color scale, which was chosen to highlight the variations observed in the EM data.

No prominent EM anomalies are visible in either the apparent ground conductivity data or in the in-phase response data that could be associated with disposal locations. A linear anomaly of high apparent ground conductivity and high in-phase response measurements is visible from the eastern wall of Building 2131 to the eastern boundary of the surveyed area. This anomaly is presumably associated with buried utilities, which are known to be present in the area of this feature. Variations in both the apparent ground conductivity and the in-phase response measurements observed in the vicinity of Building 2131 are caused by the building itself. Two additional anomalies, both in the southwestern portion of the surveyed area, are associated with anthropogenic features observed during the survey (a Kendaia Creek overpass for West Patrol Road and the SEDA property fence). No anomalies were observed that could be associated with the burial of metallic debris or the disposal of DDT.

Two soil samples were collected from a soil boring performed at a location north of Building 2131. The soil boring location was chosen because it was the only place where a small magnetic anomaly was found during a sweep of the open area north of the building using a Fisher TW6 hand-held metal detector. The instrument was set at maximum sensitivity and registered a small needle deflection in this location. The presence of the small anomaly, which was located in an open grassy area that would have been easily accessible for digging, suggested that this location was the best candidate for potential burial of the DDT, given that no significant anomalies were found in the EM-31 survey. The potential that the DDT burial occurred in the immediate vicinity of the building and to the east of the building is low because of the buried utilities. In addition, three sediment samples were collected in the drainage ditches that surround the soil boring (Figure 8-1). The rationale for selecting the boring and sediment sample locations is provided in Table 8-1.

The results of the laboratory analyses are presented in Tables 8-2 through 8-4. These results were compared to NYSDEC TAGMs and NYS sediment criteria; no PRGs have been established for sediment. The results of the comparisons are given below.

Comparison to Soil TAGMs and Sediment Criteria:

- No pesticide compounds were found at concentrations above their respective TAGMs. However, four compounds (4,4'-DDT, alpha-chlordane, endosulfan II, and heptachlor epoxide) were found in the surface soil sample SB120E-1 at estimated concentrations that were well below the TAGMs.
- No pesticide compounds were found at concentrations above their respective NYS sediment criteria, however, three compounds (4,4'-DDD, 4,4'-DDE, and 4,4'-DDT) were detected, mostly at estimated concentrations.

Comparison to Recreational PRGs:

- None of the concentrations of pesticides found in the soil exceeded the Recreational PRGs.
- No Recreational PRGs have been established for sediment.

Recommendation: Based on professional judgment, it is recommended that final actions for SEAD-120E, as outlined under Decision No. B in the Decision Criteria Flowchart, include: 1) a no action SMWU designation on all applicable permits and 2) that regulators be notified by AOC that the site will be designated as no further action with no reuse restrictions.

9.0 SEAD-120F - Munitions Burial Sites, South End of the Main Depot

9.1 Site Information

This parcel is associated with an area that is suspected to be an ammunition burial/disposal area. Interviews conducted during the 1995 EBS identified that burial of ammunitions took place in this general location (Figure 9-1).

The purpose of the investigation was to use geophysics to identify potential munitions burial sites in the south end of the Main Depot. No sampling or analyses were proposed at the site or in the nearby areas (i.e., Silver Creek) for this field investigation because the potential munitions burial sites have not yet been identified by the geophysical survey.

9.2 Investigation Summary

The site is located in the southern portion of the Depot (Figure 9-1). The site is comprised of an approximately 1,300-foot by 600-foot rectangular area that trends southeast-northwest in an area of dense brush and other vegetation. This open area is bounded on the north by storage igloos, on the east by Silver Creek, to the south by railroad tracks, and to the west by the Munitions Washout Facility (SEAD-4).

The field program consisted of an EM-31 geophysical survey of the rectangular area (approximately 600 feet by 1,400 feet) located to the east of the former munitions washout building (Figure 9-1). This area is suspected to have been the site of munitions burials. The EM-31 survey was performed by collecting EM measurements every one second along parallel, northeast-southwest oriented survey lines. These lines were spaced 20 feet apart. The local grid system that was used to reference the EM-31 survey was surveyed and referenced to the New

York State Plane coordinate system. Once the EM-31 data were collected, they were corrected for instrument drift using instrument function check data that were collected before and after the survey. Finally, the data were reduced to produce pseudo-color maps of the measured EM responses. These maps are presented in Figures 9-2 and 9-3. Figure 9-2 shows the measured apparent ground conductivity and Figure 9-3 shows the in-phase response. In each figure, the range of measured values has been mapped to an arbitrary color scale, which was chosen to highlight the variations observed in the EM data.

No prominent EM anomalies are visible in either the apparent ground conductivity data or in the in-phase response data. Three areas with slightly increased apparent ground conductivity were identified, one in the northwestern corner of the surveyed area, one in the eastern-central portion of the surveyed area, and one in the southern corner of the surveyed area. There are no associated anomalies visible in the in-phase data for any of these areas, and these slight increases in the measured apparent ground conductivity are interpreted to be caused by an increase in the overburden thickness and/or by an increase in the soil moisture content. No anomalies were observed that could be associated with the burial of metal cased munitions.

Recommendation: Based on the results of the geophysical survey, it is recommended that final actions for SEAD-120F, as outlined under Decision No. B in the Decision Criteria Flowchart, include: 1) a no action SMWU designation on all applicable permits and 2) that regulators be notified by AOC that the site will be designated as no further action with no reuse restrictions.

10.0 SEAD-120G - Mounds at the Duck Ponds

10.1 Site Information

This parcel is associated with several areas of mounds located at the Duck Ponds area (Figure 10-1). One area [109(7)] consists of earthen mounds that may be related to a small arms range that was reported in this area. It could not be determined if these mounds were in fact the location of a small arms range that was reported in an interview during the 1995 EBS. Therefore, an accurate designation of this area could not be determined in the EBS.

The other three areas [110 (7), 111(7), and 112(7)] are suspected mounds in the Duck Ponds Area that were observed during the 1995 EBS. The contents of these mounds could not be determined during the EBS.

The purpose of the investigation was to determine if soils in the mounds at the Duck Ponds Area have been impacted by contaminants. Because there are numerous mounds at the Duck Ponds, the approach was to investigate 5 representative mounds, based on the potential for impacts given the observed surface indicators (i.e., debris and stressed vegetation), and secondly based on the geographic distribution within the Duck Ponds Area. Three of these mounds (mentioned above) were previously identified in the EBS report. The constituents of concern are volatile organics, semivolatile organics, TPH, metals, and pesticides/PCBs in soil.

10.2 Investigation Summary

The site is comprised of a large area surrounding the Duck Ponds, which extends to the west to the Ammo Area perimeter. Throughout this area are numerous earthen mounds and berms ranging from minor ground disturbances to a pile of soil 30-feet high. According to SEDA

personnel, these mounds were made during an extensive history of road building, land clearing and other excavation activities at the Depot over the past 45 years; included in this was the construction of the Duck Ponds. In interviews, SEDA personnel described a standard practice of skimming and stockpiling topsoil into mounds for future use during road and facility construction. Material excavated from the Duck Ponds was deposited to form some of the mounds in the area. In addition, staging areas were formed along East Patrol Road by grading the land surface, which formed berms on the flanks of the staging areas.

The field program included five test pits in five separate mounds. Two soil samples were collected from each pit (Figure 10-1). Three of the mounds chosen for test pitting were identified in the EBS report (and noted above), and the other two mounds/disturbed areas were identified during the site inspection. These two mounds/areas were chosen to be investigated because they were in areas of the site that would provide good geographic coverage of the Duck Ponds area, considering that no other mounds in the Duck Ponds area showed significantly greater evidence for impacts based on surface observations. All five of the mounds investigated are well distributed throughout the Duck Ponds Area. The rationale for choosing these sample locations is provided in Table 10-1.

No mounds were left uninvestigated that showed a greater potential for having impacts (based on observation of the surface of the mounds) so that better geographic coverage could be obtained. Geographic coverage was considered only after determining that there were no mounds believed to be more impacted than others, based on the types of surface debris noted or the presence of stressed vegetation.

The results of the laboratory analyses are presented in Tables 10-2 through 10-9. These results were compared to NYSDEC TAGMs and Recreational PRGs. The results of the comparisons are given below.

Comparison to TAGMs:

- No volatile organic compounds were exceeded their respective TAGMs in the soil samples.
- No semivolatile organic compounds exceeded their respective TAGMs in surface or subsurface soil. The semivolatile compounds detected were mostly PAHs (nearly all at estimated concentrations). Also, several phthalate compounds were found in many of the samples (again, mostly at estimated concentrations).
- TPH concentrations were below the detection limit in all samples, with the exception of one sample. This sample had a concentration that was near the detection limit for the method. There is no TAGM for TPH.
- Five metals exceeded their respective TAGMs, however, the magnitudes of these exceedences were relatively low. The exceedences for the metals (aluminum, arsenic, lead, manganese, and thallium) were generally less than two times their respective TAGMs. The magnitude of these metals exceedences suggests that they may be due to natural variability of the concentrations of these metals in the soil.
- No pesticides or PCBs were detected in the soil samples collected at the mounds.

Comparison to Recreational PRGs:

- None of the concentrations of volatile organics, semivolatile organics, metals or pesticides and PCBs exceeded their respective Recreational PRGs in the soil samples.

Recommendation: Based on professional judgment, it is recommended that final actions for SEAD-123B, as outlined under Decision No. B in the Decision Criteria Flowchart, include: 1) a no action SMWU designation on all applicable permits and 2) that regulators be notified by AOC that the site will be designated as no further action with no reuse restrictions.

11.0 SEAD-120H - Building 810

11.1 Site Information

Building 810 was not inspected during the 1995 EBS because access to the entire site was denied based on the classified mission of the building (Figure 11-1).

11.2 Investigation Summary

No sampling was performed at this site because it is being investigated under the SEAD-12 RI/FS program.

12.0 SEAD-120I - Building 819, A0101 and A0102

12.1 Site Information

During the EBS, a visual inspection of Building 819 was performed, but its mission could not be described (Figure 12-1). A visual inspection was attempted of the ammunition storage igloos A0101 and A0102 and the surrounding area, however, access to this area was denied based on the classified mission of the area.

12.2 Investigation Summary

No sampling was performed at this site. Building 819 is being investigated under the SEAD-12 RI/FS program. Igloos A0101 and A0102 are not currently included in the SEAD-12 RI/FS Workplan, but they will be added to the work to be conducted at SEAD-12.

13.0 SEAD-120J - Farmer's Dump

13.1 Site Information

This parcel is associated with a location that was reported to have been used for dumping by a local farmer (Figure 13-1). The dumping location was reported to be west of the main Depot along Kendaia Creek.

The purpose of the investigation was to determine if surface soils within the Farmer's Dump have been impacted by oil or hazardous materials. The constituents of concern are volatile organics, semivolatile organics, TPH, metals, pesticides/PCBs, and herbicides in surface soil.

13.2 Investigation Summary

The site is located on the north side of Kendaia Creek, approximately 1,800 feet west of Route 96A (Figure 13-1). It is characterized by a dumping area along an approximately 400-foot long section of an escarpment along Kendaia Creek; the dumping area was clearly apparent using visual observation. The debris in the dumping area, however, was generally concentrated in two areas, which are marked by an "x" on Figure 13-1. The dumping in the western location spans approximately 80 feet of a 28-foot-high wooded ravine along Kendaia Creek. The extent of the dumping in the eastern location was smaller. In these two locations, the debris consists of scattered bottles, cans, broken tools, construction debris, and animal carcasses (i.e., pig body parts). With the exception of some soda cans and the pig carcasses, the rest of the debris appeared to have been dumped at these locations at least several years ago; the pig carcasses are believed to have been dumped more recently based on the strong odor in the air. These dumping locations appear to have been chosen because the ravine is steeper and wider in these areas than in the surrounding areas, which allowed more debris to be dumped.

Five surface soil samples were collected from locations immediately downgradient of the dumping areas along the escarpment (Figure 13-1). The areas were chosen because they were locations where there was significantly more debris compared to other areas, and because the contents of the debris indicated that there was a potential for a release of oil or hazardous materials. The rationale for the sample locations is provided in Table 13-1.

The results of the laboratory analyses are presented in Tables 13-2 through 13-11. These results were compared to NYSDEC TAGMs and Recreational PRGs. The results of the comparisons are given below.

Comparison to TAGMs:

- No volatile organic compounds were found at concentrations that exceeded their respective TAGMs. Only two compounds (acetone and toluene) were found in the samples. Acetone was found in one sample, but it was also found in the laboratory blank sample. Toluene was found at estimated concentrations in all of the samples. These two compounds are likely to be laboratory contaminants.
- No semivolatile organic compounds were found at concentrations that exceeded their respective TAGMs. The semivolatiles were mostly PAHs, although two phthalate compounds were found. All of the compounds found were detected at estimated concentrations.
- TPH were found in three of the four samples at concentrations that were between 23.7 mg/Kg and 71.4 mg/Kg. The one sample that did not contain detectable concentrations of TPH was SS120J-3. No TAGM has been established for TPH.
- Three metals were found at concentrations that exceeded their respective TAGMs. Among these, lead was found to exceed the TAGM in all five samples. Its TAGM exceedences ranged between 1.2 times and 5.9 times. The two other metals, copper and zinc, exceeded their TAGMs in only one sample (SS120J-3), and the exceedences were approximately 2 times the TAGM.

- None of the pesticides detected on the site were found at concentrations above their respective TAGMs. The pesticide compound 4,4'-DDT was detected in two of the soil samples (SS120J-2 and SS120J-3) at estimated concentrations that were well below the TAGM. The compound 4,4'-DDE was found in only one sample (SS120J-3), also at an estimated concentration that was well below the TAGM.
- No herbicides were found at concentrations above the detection limits.

Comparison to Recreational PRGs:

- None of the concentrations of volatile organics, semivolatile organics, metals, pesticides and PCBs, or herbicides exceeded established Recreational PRGs in the soil samples.

Recommendation: Based on professional judgment it is recommended that final actions for SEAD-120J, as outlined under Decision No. B in the Decision Criteria Flowchart, include: 1) a no action SMWU designation on all applicable permits and 2) that regulators be notified by AOC that the site will be designated as no further action with no reuse restrictions. In addition, any future use of this site should consider the presence of the trash and animal carcasses (i.e., odor nuisance).

SEAD-120A

50 Area Dumping Areas

Table 4-1

Sample Collection Information
SEAD-120A - 50 Area Dumping Areas

12 Moderate EBS Non-Evaluated Sites
Seneca Army Depot Activity

MATRIX	LOCATION ID	SAMPLE ID	SAMPLE DATE	TOP (feet)	BOTTOM (feet)	QC CODE	RATIONALE FOR SAMPLE LOCATION
SOIL	TP120A-1	EB155	3/30/98	0.0	0.6	SA	Location is a mound in the southeastern portion of the site. Chosen because the mound is located near Ovid Road and has an access ramp leading to it; it is also near r.r. tracks, near possible staging area.
SOIL	TP120A-1	EB032	3/30/98	0.0	0.6	DU	Same location as above.
SOIL	TP120A-1	EB156	3/30/98	2.0	2.5	SA	Location is the same as above. The sample was collected at approximately mid-depth in the pit because there were no VOC hits or impacts to soil.
SOIL	TP120A-2	EB157	3/31/98	0.0	0.2	SA	Location is a mound in the eastern portion of the site west of Building 2084. Chosen because the mound is located near Seneca Road and is covered in debris; it appeared to be a building material dump area.
SOIL	TP120A-2	EB158	3/31/98	2.0	2.2	SA	Location is the same as above. The sample was collected directly below debris.
SOIL	TP120A-3	EB159	3/30/98	0.0	0.6	SA	Location is a mound in the southwestern portion of the site. Chosen because the mound is next to railroad tracks and there was little vegetation on the surface of the mound.
SOIL	TP120A-3	EB160	3/30/98	2.0	2.5	SA	Location is the same as above. The sample was collected at approximately mid-depth in the pit because there were no VOC hits or impacts to soil.
SOIL	TP120A-4	EB161	3/30/98	0.0	0.6	SA	Location is a mound in the southwestern portion of the site. Chosen because the mound is at the end of railroad tracks where dumping occurred; there were several rusty drums at the base of the mound.

Table 4-1

Sample Collection Information
SEAD-120A - 50 Area Dumping Areas

12 Moderate EBS Non-Evaluated Sites
Seneca Army Depot Activity

MATRIX	LOCATION ID	SAMPLE ID	SAMPLE DATE	TOP (feet)	BOTTOM (feet)	QC CODE	RATIONALE FOR SAMPLE LOCATION
SOIL	TP120A-4	EB162	3/30/98	2.0	2.5	SA	Location is the same as above. The sample was collected at approximately mid-depth in the pit because there were no VOC hits or impacts to soil.
SOIL	TP120A-5	EB163	3/30/98	0.0	0.6	SA	Location is a mound in the northwestern portion of the site. Chosen because the mound is near West Patrol Road and it is in an area that has easy access for dumping;
SOIL	TP120A-5	EB164	3/30/98	1.0	1.2	SA	Location is the same as above. The sample was collected at approximately mid-depth in the pit because there were no VOC hits or impacts to soil.

MP Refueling Island in the Q

Table 7-1

Sample Collection Information
SEAD-120D - MP Refueling Island in the Q

12 Moderate EBS Non-Evaluated Sites
Seneca Army Depot Activity

MATRIX	LOCATION ID	SAMPLE ID	SAMPLE DATE	TOP (feet)	BOTTOM (feet)	QC CODE	RATIONALE FOR SAMPLE LOCATION
SOIL	SB120D-1	EB258	3/17/98	0.0	0.3	SA	Location is at the southwestern end of the MP refueling island. The location was chosen because it is immediately downgradient of a former underground gasoline storage tank, based on info. provided by SEDA environmental staff.
SOIL	SB120D-1	EB026	3/17/98	0.0	0.3	DU	Location same as above.
SOIL	SB120D-1	EB259	3/17/98	6.8	7.2	SA	Location same as above. Sample collected at approximately mid-depth (near water table) in the boring because no VOCs or other indications of impacts were observed in the subsurface soil.
SURFACE SOIL	SS120D-1	EB260	3/17/98	0.0	0.2	SA	Location is in the northeastern portion of the refueling island. Sample chosen because it was an area of stressed vegetation.
SURFACE SOIL	SS120D-2	EB261	3/17/98	0.0	0.2	SA	Location is in the southwestern portion of the refueling island. Sample chosen because it was an area of stressed vegetation.
WATER	SB120D-1	EB024	3/17/98	0.0	0.0	RB	NA

Notes:

SA = Sample

DU = Duplicate

RB = Rinse Blank

SEAD-120G

Mounds at the Duck Pond

Table 10-1

Sample Collection Information
SEAD-120G - Mounds at the Duck Ponds

12 Moderate EBS Non-Evaluated Sites
Seneca Army Depot Activity

MATRIX	LOCATION ID	SAMPLE ID	SAMPLE DATE	TOP (feet)	BOTTOM (feet)	QC CODE	RATIONALE FOR SAMPLE LOCATION
SOIL	TP120G-1	EB112	3/5/98	0.5	0.5	SA	Location is at north end of Duck Ponds Area; location chosen because it was where a depression within a 3-foot high mound, which was on top of a larger 4-foot high mound, was located; the mounds were covered with brush and trees.
SOIL	TP120G-1	EB113	3/5/98	2.0	2.0	SA	Location is the same as above; sample was taken at approximately mid-depth in the pit because no VOC hits or visual impacts were noted in the soil.
SOIL	TP120G-2	EB114	3/6/98	1.5	1.5	SA	Location is at north end of Duck Ponds Area; location was chosen because it is where a 100-foot long and 65 feet wide east-west trending mound is located. The trench was located on the north side of the mound, the only area that had surface debris.
SOIL	TP120G-2	EB115	3/6/98	3.0	3.0	SA	Location is the same as above; sample was taken at approximately mid-depth in the pit because no VOC hits or visual impacts were noted in the soil.
SOIL	TP120G-3	EB135	3/9/98	1.0	1.0	SA	Location is a grassy area in east-central area of Duck Ponds Area; location was chosen because it is where uneven, lumpy ground was noted; it was a location that was suspected to be a previous excavation.
SOIL	TP120G-3	EB136	3/9/98	2.0	2.0	SA	Location is the same as above; sample was taken at approximately mid-depth in the pit because no VOC hits or visual impacts were noted in the soil.

Table 10-1

Sample Collection Information
SEAD-120G - Mounds at the Duck Ponds

12 Moderate EBS Non-Evaluated Sites
Seneca Army Depot Activity

MATRIX	LOCATION ID	SAMPLE ID	SAMPLE DATE	TOP (feet)	BOTTOM (feet)	QC CODE	RATIONALE FOR SAMPLE LOCATION
SOIL	TP120G-4	EB118	3/6/98	1.5	1.5	SA	Location is a mound in southeastern portion of Duck Ponds Area; location was chosen because it is the location of a 200-foot long and 100-foot wide mound; the excavation was on the east side of the mound near the road.
SOIL	TP120G-4	EB119	3/6/98	3.5	3.5	SA	Location is the same as above; sample was taken at approximately mid-depth in the pit because no VOC hits or visual impacts were noted in the soil.
SOIL	TP120G-5	EB120	3/6/98	1.0	1.0	SA	Location is a mound in southern portion of Duck Ponds Area; location was chosen because it is where a 50-foot long, 35-foot wide, and 3-foot high area of disturbed ground with surface debris (metal strapping) was located.
SOIL	TP120G-5	EB121	3/6/98	2.0	2.0	SA	Location is the same as above; sample was taken at approximately mid-depth in the pit because no VOC hits or visual impacts were noted in the soil.

Notes:

SA = Sample

Farmer's Dump

Table 13-1

Sample Collection Information
SEAD-120J - Farmer's Dump

12 Moderate EBS Non-Evaluated Sites
Seneca Army Depot Activity

MATRIX	LOCATION ID	SAMPLE ID	SAMPLE DATE	TOP (feet)	BOTTOM (feet)	QC CODE	RATIONALE FOR SAMPLE LOCATION
SURFACE SOIL	SS120J-1	EB269	3/18/98	0.0	0.2	SA	Location is at base of a slope that is downgradient of a debris pile; debris includes rotting wood, metal siding/stove pipes, pig hides/fur/bones; also, the remains of two unlabelled drums and a container labelled (4-DAMINE No. 4) herbicide.
SURFACE SOIL	SS120J-1	EB029	3/18/98	0.0	0.2	DU	Location is at base of a slope that is downgradient of a debris pile; debris includes rotting wood, metal siding/stove pipes, pig hides/fur/bones; also, the remains of two unlabelled drums and a container labelled (4-DAMINE No. 4) herbicide.
SURFACE SOIL	SS120J-2	EB270	3/18/98	0.0	0.2	SA	Location is at the bottom of the main drainage wash into a low area; the area contained cans, glass bottles, plastic bottles, and other household debris.
SURFACE SOIL	SS120J-3	EB271	3/18/98	0.0	0.2	SA	Location is approx. 1 foot downslope of the contained labelled 4-DAMINE No. 4 mentioned above.
SURFACE SOIL	SS120J-4	EB272	3/18/98	0.0	0.2	SA	Location is just below (downgradient) an unlabelled drum, which had no bottom or top.

Notes:

ASSOCIATED AREA/UNIT: SEAD 120
PROJECT NO: 733193-01001
DATE STARTED: 17/03/98
DATE COMPLETED: 17/03/98
DRILLING CONTRACTOR: Nothnagle
DRILLING METHOD: HSA 8"
SAMPLING METHOD: Split Spoon

TOTAL DEPTH: 6.5
DEPTH TO WATER: 4
BORING LOCATION: 738814.9635 ft NORTH
999752.4051 ft EAST
COORDINATE SYSTEM: NAD83
GROUND SURFACE ELEVATION: 609.5927 ft
ELEVATION DATUM: NAVD88
INSPECTOR: MW
CHECKED BY: ITR

NOTES:

UNITED STATES ARMY
CORPS OF ENGINEERS
Seneca Army Depot
Romulus, New York

LOG OF BORING 120E-1

Laboratory Qualifiers for Chemical Data

(not all qualifiers apply)

Organics Qualifiers (GC/HPLC)

- U Indicates compound was analyzed for but not detected above the reporting limits
- J Indicates an estimated value. This flag is used when the result is less than the reporting limit, but greater than or equal to one half the reporting limit.
- P This flag is used for a pesticide/Aroclor target analyte when there is a greater than 25.0% difference for detected concentrations between the two analytical columns. The lower of the two values is reported on the Form I and flagged with a "P".
- C This flag applies to pesticide results where the identification has been confirmed by GC/MS.
- B This flag applies when the analyte is found in the associated method blank as well as in the sample. It indicates a possible/probable blank contamination and warns the data user to take appropriate action. On the samples get a "B" flag. The method blank does not.
- D This flag identifies all compounds identified in an analysis at a secondary dilution factor. This flag alerts the data users that any discrepancies between the concentrations reported for the dilutions may be due to dilution of the sample extract. It additionally indicates that spike recoveries may have been diluted below quantifiable levels.
- E This flag identifies compounds whose concentrations exceed the upper level of the calibration range of the instrument for that specific analysis. If one or more compounds have a response greater than the upper level of calibration range, the extract shall be diluted and re-analyzed.
- Y Laboratory-defined flag for semivolatile reporting. Quantitation of benzo(b/k)fluoranthene is based on the combined instrument response of the unresolved isomer peaks. The combined response has been quantified as benzo(b)fluoranthene.
- Z The reported result is based on the combined response from coeluting compounds.

Organics Qualifiers (GC/HPLC)

- A The reported Tentatively Identified Compound (TIC) is a suspected aldol-condensate product.
- B The reported analyte was detected in the associated method blank as well as the sample.
- D Compound is identified in an analysis which occurred at a dilution.
- E Compound quantitation is above the instrument's calibration range for this analysis.
- J Indicates an estimated quantitation value below reporting limit.
- U Compound was analyzed for but not detected.
- X The reported compound is a suspected laboratory contaminant.
- Z The reported results is based on the combined responses from coeluting compounds.

Metals Qualifiers

- U Entered if the analyte was analyzed for but not detected.
- N Matrix spike sample recovery not within control limits.
- B Entered if the reported value is less than the Contract Required Detection Limit (CRDL), but greater than the Instrument Detection Limit (IDL).
- E (ICP) - The reported value is estimated because of the presence of interference.
- * Duplicate analysis not within the control limits.
- M Duplicate injection precision not met.
- S The reported value was determined by the Method of Standard Additions.
- W Post digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample concentration is less than 50% of spike concentration.
- I Correlation coefficient for the MSA is less than 0.995.
