SUBJECT: Draft Final Completion Report for Munitions Response and CERCLA Closure at Seneca Army Depot, NY; Contract FA8903-04-D-8675, Delivery Order 0026, CDRL A001A

Dear Mr. Hill:

Parsons Infrastructure & Technology Group, Inc. (Parsons) is pleased to submit the Draft Final Completion Report for Munitions Response and CERCLA Closure at Seneca Army Depot Activity (SEDA) in Romulus, New York.

This work was performed in accordance with the Scope of Work (SOW) for Contract No. FA8903-04-D-8675, Task Order No. 0026.

Parsons appreciates the opportunity to provide you with the Completion Report for this work. Should you have any questions, please do not hesitate to call me at (617) 449-1405 to discuss them.

Sincerely,

Todd Heino, P.E.
Project Manager

SUBJECT: Draft Final Completion Report for Munitions Response and CERCLA Closure at the Seneca Army Depot Activity; EPA Site ID# NY0213820830 and NY Site ID# 8-50-006

Dear Mr. Vazquez/Mr. Gupta/Mr. Sergott:

Parsons Infrastructure & Technology Group, Inc. (Parsons) is pleased to submit the Draft Final Completion Report for Munitions Response and CERCLA Closure at the Seneca Army Depot Activity in (SEDA) in Romulus, New York (EPA Site ID# NY0213820830 and NY Site ID# 8-50-006). This report discusses munitions removal actions and CERCLA investigations conducted at SEAD 46 (3.5 inch Rocket Range), SEAD 57 (former Explosive Ordnance Disposal [EOD] Range), SEAD 002-R-01 (EOD Areas 2 and 3), and SEAD 007-R-01 (Grenade Range). An electronic copy of the complete Completion Report is enclosed with this submittal.

Should you have any questions, please do not hesitate to call me at (617) 449-1405 to discuss them.

Sincerely,

Todd Heino, P.E.
Program Manager

CONSOLIDATED DEFINITIONS¹

Anomaly Avoidance. Techniques employed on property known or suspected to contain UXO, other munitions that may have experienced abnormal environments (e.g., DMM), munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, to avoid contact with potential surface or subsurface explosive or CA hazards, to allow entry to the area for the performance of required operations.

Chain of Custody. The activities and procedures taken throughout the inspection, re-inspection and documentation process to maintain positive control of MPPEH to ensure the veracity of the process used to determine the status of material as to its explosive hazard. This includes all such activities from the time of collection through final disposition.

Chemical Agent (CA). A chemical compound (to include experimental compounds) that, through its chemical properties produces lethal or other damaging effects on human beings, is intended for use in military operations to kill, seriously injure, or incapacitate persons through its physiological effects. Excluded are research, development, testing and evaluation (RDTE) solutions; riot control agents; chemical defoliants and herbicides; smoke and other obscuration materials; flame and incendiary materials; and industrial chemicals.

Chemical Agent (CA) Hazard. A condition where danger exists because CA is present in a concentration high enough to present potential unacceptable effects (e.g., death, injury, damage) to people, operational capability, or the environment.

Chemical Agent (CA) Safety. A condition where operational capability and readiness, people, property, and the environment are protected from the unacceptable effects or risks of a mishap involving chemical warfare material (CWM).

Chemical Warfare Material (CWM). Items generally configured as a munition containing a chemical compound that is intended to kill, seriously injure, or incapacitate a person through its physiological effects. CWM includes V- and G-series nerve agents or H-series (mustard) and L-series (lewisite) blister agents in other-than-munition configurations; and certain industrial chemicals (e.g., hydrogen cyanide (AC), cyanogen chloride (CK), or carbonyl dichloride (called phosgene or CG)) configured as a military munition. Due to their hazards, prevalence, and military-unique application, chemical agent identification sets (CAIS) are also considered CWM. CWM does not include: riot control devices; chemical defoliants and herbicides; industrial chemicals (e.g., AC, CK, or CG) not configured as a munition; smoke and other obscuration producing items; flame and incendiary producing items; or soil, water, debris or other media contaminated with low concentrations of chemical agents where no CA hazards exist.

¹ Definitions copied from <https://www.denix.osd.mil/denix/Public/Library/Explosives/UXOSafety/glossary.html>.

Chemical Warfare Material (CWM) Response. Munitions responses and other responses to address the chemical safety; explosives safety, when applicable; human health; or environmental risks presented by CA-filled munitions and CA in other than munitions configurations. (See munitions response.)

Construction Support. Assistance provided by DoD EOD or UXO-qualified personnel and/or by personnel trained and qualified for operations involving CA, regardless of configuration, during intrusive construction activities on property known or suspected to contain UXO, other munitions that may have experienced abnormal environments (e.g., DMM), munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, to ensure the safety of personnel or resources from any potential explosive or CA hazards.

Cultural Debris. Debris found on operational ranges or munitions response sites, which may be removed to facilitate a range clearance or munitions response, that is not related to munitions or range operations. Such debris includes, but is not limited to: rebar, household items (refrigerators, washing machines, etc.), automobile parts and automobiles that were not associated with range targets, fence posts, fence wire, and magnetic rocks.

Defense Sites. Locations that are or were owned by, leased to, or otherwise possessed or used by the Department of Defense. The term does not include any operational range, operating storage or manufacturing facility, or facility that is used for or was permitted for the treatment or disposal of military munitions. (10 U.S.C. 2710(e)(1))

Discarded Military Munitions (DMM). Military munitions that have been abandoned without proper disposal or removed from storage in a military magazine or other storage area for the purpose of disposal. The term does not include unexploded ordnance, military munitions that are being held for future use or planned disposal, or military munitions that have been properly disposed of consistent with applicable environmental laws and regulations. (10 U.S.C. 2710(e)(2))

Disposal. End of life tasks or actions for residual materials resulting from demilitarization or disposition operations.

Disposition. The process of reusing, recycling, converting, redistributing, transferring, donating, selling, demilitarizing, treating, destroying, or fulfilling other life-cycle guidance, for DoD property.

Documentation of the Explosives Safety Status of Material. Documentation attesting that material: (1) does not present an explosive hazard and is consequently safe for unrestricted transfer within or release from DoD control, or (2) is MPPEH, with the known or suspected explosive hazards stated, that is only transferable or releasable to a qualified receiver. This documentation must be signed by a technically qualified individual with direct knowledge of: (1) the results of both the material's 100 percent inspection and 100 percent re-inspection or of the approved process used and the appropriate level of re-inspection, and (2) the veracity of the chain-of-custody for the material. This signature is followed by the signature of another technically qualified individual who inspects the material on a sampling basis (sampling procedures are determined by DoD entity that is inspecting the material).

Environmental Regulators and Safety Officials. Include, but may not be limited to environmental regulators, environmental coordinators or hazardous material coordinators, law enforcement officers, and safety personnel of the U.S. Environmental Protection Agency (USEPA), American Indians and Alaska Natives, other Federal Land Managers, and/or the States. When appropriate, public health officials of various agencies may also be involved.

Explosive Hazard. A condition where danger exists because explosives are present that may react (e.g., detonate, deflagrate) in a mishap with potential unacceptable effects (e.g., death, injury, damage) to people, property, operational capability, or the environment.

Explosive Ordnance Disposal (EOD). The detection, identification, on-site evaluation, rendering safe, recovery, and final disposal of unexploded ordnance and of other munitions that have become an imposing danger, for example, by damage or deterioration.

EOD incident. The suspected or detected presence of a UXO or damaged military munitions that constitutes a hazard to operations, installations, personnel, or material. Not included are accidental arming or other conditions that develop during the manufacture of high explosives material, technical service assembly operations, or the laying of landmines or demolition charges.

Explosive Ordnance Disposal (EOD) Personnel. Military personnel who have graduated from the Naval School, Explosive Ordnance Disposal; are assigned to a military unit with a Service-defined EOD mission; and meet Service and assigned unit requirements to perform EOD duties. EOD personnel have received specialized training to address explosive and certain CA hazards during both peacetime and wartime. EOD personnel are trained and equipped to perform Render Safe Procedures (RSP) on nuclear, biological, chemical, and conventional munitions, and on improvised explosive devices.

Explosive Ordnance Disposal (EOD) Unit. A military organization constituted by proper authority; manned with EOD personnel; outfitted with equipment required to perform EOD functions; and assigned an EOD mission.

Explosives or Munitions Emergency Response. All immediate response activities by an explosives and munitions emergency response specialist to control, mitigate, or eliminate the actual or potential threat encountered during an explosives or munitions emergency. An explosives or munitions emergency response may include in-place render-safe procedures, treatment or destruction of the explosives or munitions, and/or transporting those items to another location to be rendered safe, treated, or destroyed. Any reasonable delay in the completion of an explosives or munitions emergency response caused by a necessary, unforeseen, or uncontrollable circumstance will not terminate the explosives or munitions emergency. Explosives and munitions emergency responses can occur on either public or private lands and are not limited to responses at RCRA facilities. (Military Munitions Rule, 40 CFR 260.10)

Explosives Safety. A condition where operational capability and readiness, people, property, and the environment are protected from the unacceptable effects or risks of potential mishaps involving military munitions.

Interim Holding Facility (IHF). A temporary storage facility designed to hold recovered chemical warfare material (RCWM).

Land Use Controls (LUC). LUC are physical, legal, or administrative mechanisms that restrict the use of, or limit access to, real property to manage risks to human health and the environment. Physical mechanisms encompass a variety of engineered remedies to contain or reduce contamination and/or physical barriers to limit access to real property, such as fences or signs.

Long-term Management (LTMgt). The period of site management (including maintenance, monitoring, record keeping, 5-year reviews, etc.) initiated after response (removal or remedial) objectives have been met (i.e., after Response Complete).

Material Potentially Presenting an Explosive Hazard (MPPEH). Material potentially containing explosives or munitions (e.g., munitions containers and packaging material; munitions debris remaining after munitions use, demilitarization, or disposal; and range-related debris); or material potentially containing a high enough concentration of explosives such that the material presents an explosive hazard (e.g., equipment, drainage systems, holding tanks, piping, or ventilation ducts that were associated with munitions production, demilitarization or disposal operations). Excluded from MPPEH are munitions within DoD's established munitions management system and other hazardous items that may present explosion hazards (e.g., gasoline cans, compressed gas cylinders) that are not munitions and are not intended for use as munitions.

Military Munitions. Military munitions means all ammunition products and components produced for or used by the armed forces for national defense and security, including ammunition products or components under the control of the Department of Defense, the U.S. Coast Guard, the U.S. Department of Energy, and the National Guard. The term includes confined gaseous, liquid, and solid propellants, explosives, pyrotechnics, chemical and riot control agents, smokes, and incendiaries, including bulk explosives, and chemical warfare agents, chemical munitions, rockets, guided and ballistic missiles, bombs, warheads, mortar rounds, artillery ammunition, small arms ammunition, grenades, mines, torpedoes, depth charges, cluster munitions and dispensers, demolition charges, and devices and components of the above.

The term does not include wholly inert items, improvised explosive devices, and nuclear weapons, nuclear devices, and nuclear components, other than non-nuclear components of nuclear devices that are managed under the nuclear weapons program of the Department of Energy after all required sanitization operations under the Atomic Energy Act of 1954 (42 U.S.C. 2011 et seq.) have been completed. (10 U.S.C. 101(e)(4)(A) through (C))

Military Munitions Burial Site. A site, regardless of location, where military munitions or CA, regardless of configuration, were intentionally buried, with the intent to abandon or discard. This term includes burial sites used to dispose of military munitions or CA, regardless of configuration, in a manner consistent with applicable environmental laws and regulations or the national practice at the time of burial. It does not include sites where munitions were intentionally covered with earth during

authorized destruction by detonation, or where in-situ capping is implemented as an engineered remedy under an authorized response action.

Minimum Separation Distance (MSD). MSD is the distance at which personnel in the open must be from an intentional or unintentional detonation.

Munition with the Greatest Fragmentation Distance (MGFD). The munition with the greatest fragment distance that is reasonably expected (based on research or characterization) to be encountered in any particular area.

Munitions Constituents (MC). Any materials originating from unexploded ordnance (UXO), discarded military munitions (DMM), or other military munitions, including explosive and non-explosive materials, and emission, degradation, or breakdown elements of such ordnance or munitions. (10 U.S.C. 2710(e)(3)).

Munitions Debris. Remnants of munitions (e.g., fragments, penetrators, projectiles, shell casings, links, fins) remaining after munitions use, demilitarization, or disposal.

Munitions and Explosives of Concern (MEC). This term, which distinguishes specific categories of military munitions that may pose unique explosives safety risks means: (A) Unexploded ordnance (UXO), as defined in 10 U.S.C. 101(e)(5); (B) Discarded military munitions (DMM), as defined in 10 U.S.C. 2710(e)(2); or (C) Munitions constituents (e.g., TNT, RDX), as defined in 10 U.S.C. 2710(e)(3), present in high enough concentrations to pose an explosive hazard.

Munitions Response. Response actions, including investigation, removal actions and remedial actions to address the explosives safety, human health, or environmental risks presented by unexploded ordnance (UXO), discarded military munitions (DMM), or munitions constituents (MC), or to support a determination that no removal or remedial action is required.

Munitions Response Area (MRA). Any area on a defense site that is known or suspected to contain UXO, DMM, or MC. Examples include former ranges and munitions burial areas. A munitions response area is comprised of one or more munitions response sites.

Munitions Response Site (MRS). A discrete location within an MRA that is known to require a munitions response.

Mutual Agreement. A meeting of the minds on a specific subject, and a manifestation of intent of the parties to do or refrain from doing some specific act or acts. Inherent in any mutual agreement or collaborative process are the acknowledgement of each member's role in the process and their differing views of their authorities. The mutual agreement process will provide a means of resolving differences without denying the parties an opportunity to exercise their respective authorities should mutual agreement fail to be achieved.

One Percent Lethality Distance. A distance calculated from a given CA Maximum Credible Event (MCE) and meteorological conditions (temperature, wind speed, Pasquill stability factor) and established as the distance at which dosage from that MCE agent release would be 150 mg-min/m³ for H and HD agents, 75 mg-min/m³ for HT agent, 150 mg-min/m³ for Lewisite, 10 mg-min/m³ for

GB agent, 4.3 mg-min/m³ for VX vapor, and 0.1 mg-min/m³ for inhalation and deposition of liquid VX.

On-call Construction Support. Construction support provided, on an as needed basis, where the probability of encountering UXO, other munitions that may have experienced abnormal environments (e.g., DMM), munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, has been determined to be low. This support can respond from off-site when called, or be on-site and available to provide required construction support.

On-site Construction Support. Dedicated construction support, where the probability of encountering UXO, other munitions that may have experienced abnormal environments (e.g., DMM), munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, has been determined to be moderate to high.

On-the-Surface. A situation in which UXO, DMM or CWM are: (A) entirely or partially exposed above the ground surface (i.e., the top of the soil layer); or (B) entirely or partially exposed above the surface of a water body (e.g., as a result of tidal activity).

Open Burn (OB). An open-air combustion process by which excess, unserviceable, or obsolete munitions are destroyed to eliminate their inherent explosive hazards.

Open Detonation (OD). An open-air process used for the treatment of excess, unserviceable or obsolete munitions whereby an explosive donor charge initiates the munitions being treated.

Operational Range. A range that is under the jurisdiction, custody, or control of the Secretary of Defense and that is used for range activities; or although not currently being used for range activities, that is still considered by the Secretary to be a range and has not been put to a new use that is incompatible with range activities. (10 U.S.C. 101(e)(3)(A) and (B)). Also includes "military range," "active range," and "inactive range" as those terms are defined in 40 CFR §266.201.

Primary Explosives. Primary explosives are highly sensitive compounds that are typically used in detonators and primers. A reaction is easily triggered by heat, spark, impact or friction. Examples of primary explosives are lead azide and mercury fulminate.

Public Access Exclusion Distance (PAED). The PAED is defined as longest distance of the hazardous fragment distance, IBD for overpressure, or the One Percent Lethality Distance. For siting purposes, the PAED is analogous to the IBD for explosives; therefore, personnel not directly associated with the chemical operations are not to be allowed within the PAED.

Qualified Receiver. Entities that have personnel who are, or individuals who are, trained and experienced in the identification and safe handling of used and unused military munitions, and any known or potential explosive hazards that may be associated with the MPPEH they receive; and are licensed and permitted or otherwise qualified to receive, manage, and process MPPEH.

Range. A designated land or water area that is set aside, managed, and used for range activities of the Department of Defense. The term includes firing lines and positions, maneuver areas, firing lanes, test pads, detonation pads, impact areas, electronic scoring sites, buffer zones with restricted access, and

exclusionary areas. The term also includes airspace areas designated for military use in accordance with regulations and procedures prescribed by the Administrator of the Federal Aviation Administration. (10 U.S.C. 101(e)(1)(A) and (B))

Range activities. Research, development, testing, and evaluation of military munitions, other ordnance, and weapons systems; and the training of members of the armed forces in the use and handling of military munitions, other ordnance, and weapons systems. (10 U.S.C. 101(e)(2)(A) and (B))

Range Clearance. The destruction, or removal and proper disposition of used military munitions (e.g., unexploded ordnance (UXO) and munitions debris) and other range-related debris (e.g., target debris, military munitions packaging and crating material) to maintain or enhance operational range safety or prevent the accumulation of such material from impairing or preventing operational range use. "Range clearance" does not include removal, treatment, or remediation of chemical residues or munitions constituents from environmental media, nor actions to address discarded military munitions (e.g., burial pits) on operational ranges.

Range-Related Debris. Debris, other than munitions debris, collected from operational ranges or from former ranges (e.g., target debris, military munitions packaging and crating material).

Recovered Chemical Warfare Material (RCWM). CWM used for its intended purpose or previously disposed of as waste, which has been discovered during a CWM response or by chance (e.g., accidental discovery by a member of the public) that DoD has either secured in place or placed under DoD control, normally in a DDESB-approved storage location or interim holding facility, pending final dispositions.

Render Safe Procedures (RSP). The portion of EOD procedures that involves the application of special disposal methods or tools to interrupt the functioning or otherwise defeat the firing train of UXO from triggering an unacceptable detonation.

Secondary Explosives. Secondary explosives are generally less sensitive to initiation than primary explosives and are typically used in booster and main charge applications. A severe shock is usually required to trigger a reaction. Examples are TNT, cyclo-1,3,5-trimethylene-2,4,6-trinitramine (RDX or cyclonite), HMX, and tetryl.

Small Arms Ammunition. Ammunition, without projectiles that contain explosives (other than tracers), that is .50 caliber or smaller, or for shotguns.

Team Separation Distance (TSD). The distance that munitions response teams must be separated from each other during munitions response activities involving intrusive operations.

Technical Escort Unit (TEU). A DoD organization manned with specially trained personnel that provide verification, sampling, detection, mitigation, render safe, decontamination, packaging, escort and remediation of chemical, biological and industrial devices or hazardous material.

Technology-aided Surface Removal. A removal of UXO, DMM or CWM on the surface (i.e., the top of the soil layer) only, in which the detection process is primarily performed visually, but is

augmented by technology aids (e.g., hand-held magnetometers or metal detectors) because vegetation, the weathering of UXO, DMM or CWM, or other factors make visual detection difficult.

Time Critical Removal Action (TCRA). Removal actions where, based on the site evaluation, a determination is made that a removal is appropriate, and that less than 6 months exists before on-site removal activity must begin. (40 CFR 300.5)

Unexploded Ordnance (UXO). Military munitions that (A) have been primed, fuzed, armed, or otherwise prepared for action; (B) have been fired, dropped, launched, projected, or placed in such a manner as to constitute a hazard to operations, installations, personnel, or material; and (C) remain unexploded either by malfunction, design, or any other cause. (10 U.S.C. 101(e)(5)(A) through (C))

UXO Technicians. Personnel who are qualified for and filling Department of Labor, Service Contract Act, Directory of Occupations, contractor positions of UXO Technician I, UXO Technician II, and UXO Technician III.

UXO-Qualified Personnel. Personnel who have performed successfully in military EOD positions, or are qualified to perform in the following Department of Labor, Service Contract Act, Directory of Occupations, contractor positions: UXO Technician II, UXO Technician III, UXO Safety Officer, UXO Quality Control Specialist, or Senior UXO Supervisor.

Venting. Exposing any internal cavities of MPPEH, to include training or practice munitions (e.g., concrete bombs), using DDESB- or DoD Component-approved procedures, to confirm that an explosive hazard is not present.

1.0 INTRODUCTION

Parsons Infrastructure and Technology Group Inc. (Parsons) was awarded Contract No. FA8903-04-D-8675, Delivery Order No. 0026, by the Air Force Center for Engineering and the Environment (AFCEE – formerly known as Air Force Center for Environmental Excellence) to conduct Munitions Response and CERCLA Closure for four Areas of Concern (AOCs) at the Seneca Army Depot in Seneca County, New York (**Figure 1-1**). This Completion Report presents, summarizes, and documents the ordnance removal and environmental sampling and analysis activities performed by Parsons at the four areas of concern (AOCs) at the former Seneca Army Depot Activity (SEDA) under this delivery order. The AOCs where work was performed included the former Explosive Ordnance Disposal (EOD) Range (SEAD 57), the former 3.5-inch Rocket Range (SEAD 46), the former Grenade Range (SEAD 007-R-01), and the former EOD Area 2 and the former EOD Area 3 (both part of SEAD 002-R-001).

The overall objectives of this project were to:

- Remove Material Potentially Presenting an Explosive Hazard (MPPEH) from the four AOCs so that the property can be released by the U.S. Department of Defense (DOD) for transfer.
- Collect, summarize, and evaluate analytical data at each of the AOCs to document that levels of chemicals still present at the AOCs do not pose potential threats to human health or the environment.

This report documents all MPPEH removal and sampling and analysis activities that were performed to achieve the project objectives. The MPPEH activities were performed and completed in accordance with the U.S. Department of Defense Explosive Safety Board (DDESB) approved Explosive Safety Submission (ESS) dated August 18, 2006. The environmental sampling and analysis activities completed as part of this effort were performed in accordance with procedures identified in the document entitled “Site-Wide Sampling and Analysis Plan, Munitions Response and CERCLA Closure” (Parsons, April 2006).

1.1 BACKGROUND

SEDA is a former U.S. Army facility located in New York State, within Seneca County in the towns of Romulus and Varick. SEDA occupies approximately 10,600 acres of land located between Seneca and Cayuga Lakes (**Figure 1-1**). It is bounded on the west by State Route 96A and on the east by State Route 96. The cities of Geneva and Rochester are located to the northwest (14 and 50 miles, respectively); Syracuse is 53 miles to the northeast and Ithaca is 31 miles to the south. The surrounding area is generally used for farming and rural in nature.

SEDA was nominated for listing on the Federal Facilities National Priorities List (NPL) on July 13, 1989; the listing was finalized on August 30, 1990. Consequently, all work performed under this contract was performed according to Comprehensive Environmental Response Compensation and Liability Act (CERCLA) and terms of the “Federal Facility Agreement under CERCLA Section 120 in the matter of Seneca Army Depot, Romulus, New York.”

In 1995 SEDA was added to the Department of Defense's (DoD's) Base Realignment and Closure (BRAC) List and was officially closed in 1999. In December 1998, the U.S. Army Corps of Engineer's (USACE) finalized DoD's BRAC Ordnance and explosives Archives Search Report (ASR) which compiles ordnance related information about the site through historical research, aerial photography analysis, interviews with persons associated with the site, and a site inspection. The Seneca County Industrial Development Agency (IDA) has prepared a reuse plan entitled "Seneca Army Depot Reuse Plan and Implementation Strategy." This plan outlines the reuse potential of the installation for housing developments, industrial development, institutional and conservation/recreation purposes upon transfer.

1.2 AOC DESCRIPTIONS

The four AOCs included under this delivery order encompass an area of approximately 163 acres within the 10,587-acre SEDA property. The Site Map showing the location of the AOCs included in this project and the locations of the storage magazines is presented on **Figure 1-2**.

1.2.1 Former 3.5-inch Rocket Range (SEAD 46)

SEAD 46 is located within a 68 acre (approximate) parcel of land that is situated east of the Depot's former Ammunition Storage Area near the Depot's northeast boundary, immediately south of East-West Base Line Road, and east of the East Patrol Road. Access into SEAD 46 is gained via a paved road that intersects East Patrol Road from the west at a point roughly half-way between East-West Base Line and West Romulus Road. Once past the enclosing perimeter wooded area, the road turns to the northwest and forms the central core of the former range area. The central core of the site extends from the southeast to the northwest along the access road. Land surrounding the central core of the site is predominantly open, and bounded on all sides by barrier wooded areas. Beyond to the wooded areas to the west are wetlands. An earthen berm, which served as the historic target area, is located near the northwestern edge of the site. **Figure 1-3** is an aerial photograph that shows the location and approximate extent of SEAD 46.

Although the ASR described SEAD 46 as a 3.5" Rocket Range, it includes a reputed EOD disposal site as well as a known Reserve Component Training Area. Based on the findings of the Engineering Evaluation/Cost Analysis (EE/CA), the likely use of the AOC was as a rocket motor function testing range. There is at least one picture of a 3.5-inch motor fixed to a tripod in front of the hill in the SEDA historical records.

1.2.2 Former Explosive Ordnance Disposal (EOD) Range (SEAD 57)

SEAD 57, formerly known as EOD Area 1, consists of approximately 72 acres of land near the northwestern boundary of the Depot immediately adjacent and south of the Open Burning/Open Detonation Grounds (435 acres) (**Figure 1-4**) and northeast of the Grenade Range. SEAD 57 is located south of an unnamed paved road that connects North-South Base Line Road on the east and West Patrol Road on the west in this part of the Depot. An earthen berm lies roughly 600 feet to the south of the unnamed road and is located in the center of the SEAD 57 area. Land within a 1000 foot radius of the center of the berm constitutes the approximate extent of the site.

The 143rd Ordnance Detachment was a Department of Army tenant organization located at Seneca Army Depot that performed ordnance and explosives (OE) disposal by detonation for more than 20 years.

1.2.3 Grenade Range (SEAD 007-R-01)

The Grenade Range (SEAD 007-R-01) is approximately 28 acres in size, and is located to the west and southwest of SEAD 57 along the west, northwestern edge of the Depot. The Grenade Range was constructed during the mid 1980s (**Figure 1-5**) and served as a Security Force Practice Range. The range is aligned south to north, with the firing line located near the southern end and with the target area to the north. Access into the range is from the south via a paved road that intersects East-West Base Line Road roughly 1000 feet east of its intersection with West Patrol Road. The range is generally open, and bounded by wooded areas along all edges except the southern end.

The range contained wooden and armored vehicle targets; distance and boundary markers; and the range control tower. The ASR states that 40mm M781 and 35mm M73 sub-caliber practice LAW were used at the AOC for security forces training. There is no record (or indication at the targets) that HE rounds were used. Small arms (blanks) casings were reported to be present at the time of the ASR in 1998.

1.2.4 EOD Areas 2 and 3 (SEAD 002-R-01)

The EOD Area #2 and #3 (SEAD 002-R-01) are both located in the northeast portion of the Depot in the immediate proximity of the Duck Pond, and located to the south of East-West Base Line Road. EOD Area 2 is located on the western shore of the Duck Pond to the west of SEAD 46 as shown on **Figure 1-6** and **1-7**. Access into EOD Area #2 is gained from the west via East-West Base Line Road. EOD Area #2 and EOD Area #3 are separated by the southern extreme of the Duck Pond that has flooded across the former path of East-West Baseline Road. Access to EOD Area #3 is also gained from East-West base Line Road which must be accessed from the east off of East Patrol Road.

The 1998 ASR states that explosive devices were used in this area, and non-explosive projectiles were thrown in the water at the Duck Pond. The EOD Area 3 is located 250 feet to the north of the earthen berm in SEAD 46 as shown on **Figure 1-7**. The 2.5 acre area is mostly flat with the exception of a 100 by 200 foot depression in the middle of the site. This site was reported in the 1999 ASR as an EOD disposal area.

2.0 REVIEW OF PRIOR WORK

2.1 PRIOR MUNITIONS RESPONSE WORK

The DoD BRAC Ordnance and Explosives Archives Search Report identified numerous sites including the four AOCs in this project for further consideration in 1998 (ASR 1998). In 2000, Parsons conducted an Ordnance Engineering Evaluation and Cost Analysis (OE EE/CA) for all ordnance sites at Seneca Army Depot including the AOCs in this project. Additional investigation was conducted at SEAD 46 and 57 by the Shaw Group and the results were presented in the Geophysical Investigation Munitions Destruction Areas SEADs 46 & 57, Seneca Army Depot Activity, April 2005. The previous investigations defined the presence, density and extent of ordnance contamination at these sites. This information was used to support this project.

2.1.1 Former 3.5-inch Rocket Range (SEAD 46)

As part of the OE EE/CA (Parsons, 2004), geophysical surveys and intrusive investigations were conducted over roughly 17.5 acres of SEAD 46 in 2000 and 1,155 anomalies were investigated; 478 were found to contain munitions debris, and 10 of these were MPPEH (material potentially presenting an explosive hazard). The majority of MPPEH recovered (M4071A 40mm practice grenades) were located at the south end of the AOC, opposite the target berm. This probably reflects the AOC's use as a local training area in 1980s and 1990s.

During the Geophysical Investigation conducted by Shaw (April 2005) of SEAD 46 and 57, approximately 24 acres including some areas that overlaid land investigated in the OE EE/CA of SEAD 46 were digitally mapped. There was one area where the digital geophysical mapping (DGM) survey detected anomaly densities greater than 600 anomalies per acre. Areas that are saturated with anomalies or have more than 600 per acre are considered saturated response areas (SRAs). There was one SRA identified to the west of the berm at SEAD 46. This area is approximately one acre in size. In addition to the identification of the SRA, 98 anomalies were intrusively investigated by Shaw. The results of this investigation indicated that 32 aluminum munitions debris (MD), six ferrous MD, and 60 cultural debris (CD) with no MPPEH items were found.

Shaw also investigated more than 18,750 linear feet of transects that were cut into wooded areas that surrounded the core of SEAD 46. Each of these transects were opened to a width of approximately 10 feet, and a magnetometer was used to survey the ground. An additional 147 anomalies were identified using this "mag and flag" approach within the site.

Table 3-1 provides a summary of the geophysical investigations that were performed at SEAD 46, and the extent of the areal coverage of the varying geophysical survey techniques.

2.1.2 Former EOD Range (SEAD 57)

As part of the OE EE/CA (Parsons, 2004), geophysical surveys and intrusive investigations were conducted at SEAD 57. Twenty-three percent (23%) of the 60 acres were mapped, 1,700 anomalies were investigated and 954 recovered items were classified as MD. Three of these were determined to be munitions and explosives of concern (MEC). The three items were one MK2 grenade and two,

20mm projectiles. During the surface sweep for the EE/CA, a 37mm armor piercing high explosive (APHE) item was found near the abandoned ammunition disassembly area across the road from the AOC. During the intrusive portion of the EE/CA investigation, all MD and MEC items identified were encountered between the ground surface and six inches below the surface.

During Shaw's Geophysical Investigation of SEAD 57 (April 2005), approximately 22.5 acres of the AOC were digitally mapped. The results indicated six SRAs at SEAD 57. The largest was an approximate 400-foot radius ejection spray pattern radiating out from the demo berm with the greatest concentration to the west of the SEAD 57 berm. A total of 13 acres of SRA were found at SEAD 57. During the Shaw investigation, 75 anomalies were intrusively investigated at SEAD 57. Four MPPEH items (a 75mm, a 75mm AP, a 105mm and an unknown bomb) were found in the 75 anomalies investigated. These items were determined to be MD following venting. Only one MD item was discovered below 6 inches in depth.

Additionally, approximately 40 acres of heavy vegetation within an 1,800 foot radius of SEAD 57 were partially investigated by clearing and grubbing 10-foot wide transects spaced every 50 feet in the heavily wooded area. Shaw cleared 16,982 linear feet of these transects using the "mag and flag" technique.

Table 3-1 provides a summary of the geophysical investigations that were performed at SEAD 57, and the extent of the areal coverage of the varying geophysical survey techniques.

2.1.3 Grenade Range (SEAD 007-R-01)

The OE EE/CA for the Grenade Range was finalized in February of 2004. During the OE EE/CA, 15 acres was geophysically mapped at the Grenade Range using an EM-61 instrument. In addition to the 15 acres (65 grids), the EM61 and a wandering path methodology was used to sample 10% of the area between the firing line and the target area. Relocation and verification of DGM targets during the EE/CA investigated 865 DGM targets in the Grenade Range area. This intrusive investigation resulted in 102 MPPEH items (101, 35 mm sub-cal LAW M73, and 1 Rifle Grenade M407A1, Practice) and numerous munitions debris items.

2.1.4 EOD Areas 2 and 3 (SEAD 002-R-01)

As part of the OE EE/CA, geophysical surveys and intrusive investigations were conducted in 2000 at EOD Areas #2 and #3 (SEAD 002-R-01). Forty-six percent (46%) of the 5-acre EOD #2 Area was surveyed and 89 anomalies were investigated. Six of the items were MD and one item was MEC. All items were found in the upper three inches of the soil. A total of 80% of the 5-acre EOD #3 Area was surveyed and 64 anomalies were investigated. Thirteen of the items were MD and no items were classified as MEC.

2.2 PRIOR ENVIRONMENTAL INVESTIGATIONS

An expanded site inspection (ESI) was conducted at SEAD 57 during 1993 and 1994 and remedial investigations focusing on the nature and extent of contaminants in various media were performed at SEAD 46 and SEAD 57 between 1999 and 2000. The ESI conducted at SEAD 57 included the

excavation and sampling of test pits; the installation, development and testing of monitoring wells; sampling and analysis of groundwater; and the collection and analysis of surface soil samples. Information pertinent to and results of the ESI performed at SEAD 57 are reported in the document Final “*Expanded Site Inspection, Three Moderate Priority SWMUs, SEAD 11, 13, 57*” (Parsons, 1995). Chemical results for soil from this work are summarized in Section 4 below.

The remedial investigation at SEAD 46 and SEAD 57 included the following activities:

- UXO Avoidance,
- Surveying,
- Geophysical investigations (SEAD 57 only),
- Test pitting (SEAD 57 only),
- Soil sampling,
- Surface water sampling ,
- Ditch soil (sediment) sampling,
- Installation of monitoring wells,
- Groundwater sampling,
- Building investigation (SEAD 57 only),
- Chemical and physical characterization of samples, and,
- A qualitative ecological assessment of the area of SEAD 46, SEAD 57 and neighboring (0.5 mile radius) properties.

The RI work performed at SEAD 46 and SEAD 57 is reported in the document Draft “*Remedial Investigation Report for SEAD-46 and SEAD-57*” (Parsons, 2001). Chemical results from this work are discussed in Section 4 below.

No prior investigations focusing on hazardous chemical substance releases have been conducted at SEAD 002-R-01 or SEAD 007-R-001.

3.0 SITWORK

All site work for the Munitions Response portion of the project can be broken down to two activities. The first is the intrusive investigation which includes the geophysical mapping and intrusive investigation, examination and removal of selected targets. The second is the physical removal and sorting of SRA soil from areas where individual anomaly locations cannot be identified in the geophysical data.

Most of the geophysical mapping work that served as the basis of the Munitions Response effort was completed and documented during the OE EE/CA (Parsons 2004) and Geophysical Investigation (Shaw 2005), as are described above. Geophysical anomalies that had been identified during these prior investigations were reacquired in the field during the response effort and intrusively investigated by UXO survey crews. Geophysical investigations of additional new areas (e.g., SEAD 57 Buffer Zone and Local Training Areas) were also completed as part of the munitions response work. The full extent of geophysical survey coverage attained as a result of the three investigations (i.e., OE EE/CA, Geophysical Investigations, and Munitions Response activities) is summarized in **Table 3-1**. Figures depicting the extent of the geophysical coverage attained at each of the investigated AOCs are presented as shown below:

- SEAD 46, the 3.5 inch Rocket Range (Small Arms Range), **Figure 3-1**
- SEAD 57, Explosive Ordnance Disposal (EOD) and Buffer Area, **Figure 3-2**
- SEAD 002-R-001, EOD Area #2, **Figure 3-3**
- SEAD 002-R-001, EOD Area #3, **Figure 3-4**
- SEAD 007-R-01, Grenade Range, **Figure 3-5**
- Local Training Areas, **Figure 3-6**

3.1 MOBILIZATION

Parsons mobilized personnel, equipment, materials, and subcontractors to SEDA starting on May 7, 2006, to perform site work and MPPEH removal activities following the Notice to Proceed. The field team consisted of a Site Manager, Site Safety and Health Officer/Quality Control Officer (UXOQC), geophysical data collection/reacquisition teams, two dig teams, and a Senior UXO Supervisor (SUXOS). Additionally, the ordnance disposal subcontractor, USA Environmental (USA), and the site work subcontractor Severson Environmental Services Inc. (Severson) were mobilized to the site.

All earthmoving equipment that was utilized during the MPPEH removal effort was fitted with 2-inch Plexiglas[®] protective shields in order to protect the operator from fragment hazards due to unintentional detonations.

3.2 SITE PREPARATION

Following mobilization of equipment and personnel, all open areas were mowed to 8 inches to allow the anomaly investigation teams unrestricted access to the work site. The soil screening equipment

was set up at SEAD 57 since 90 percent of the soil planned for excavation was situated there. Once the SEAD 57 screening equipment work area was established, the dig teams performed a surface sweep and investigated all the identified anomalies in the lay down area. After site setup was completed, all other work zones and support zones were established to ensure that the independent team separation distance of 200 foot distances could be maintained.

3.3 SOIL EXCAVATION

Initially, the best method of MPPEH removal for high density anomaly areas was thought to be excavation of SRA soil followed by mechanical screening of the excavated material to remove MPPEH and MD. The SRAs were presumed to contain ferrous MPPEH and MD. As the intrusive investigation moved towards identifying the source of the SRA, it was determined that the cause of the SRA was the high percentage of aluminum MD and not the presence of ferrous MD and MPPEH that was anticipated. The mechanical screening process was abandoned after intrusive investigations and material processing determined the majority of the MD to be non-ferrous.

Initially, excavation was planned for several areas at SEAD 46 and 57:

- A saturated response area northwest of the SEAD 46 backstop (SEAD 46 SRA);
- Front face of the back stop berm at SEAD 46 (SEAD 46 berm);
- SEAD 57 kick out area extending away from the SEAD 57 berm predominantly in the northwest direction to 250 feet (SEAD 57 kick out);
- Interior face of the SEAD 57 horseshoe-shaped berm (SEAD 57 berm); and
- A saturated response area north west of the SEAD 57 berm (SEAD 57 SRA).

Generally, soil was to be excavated to a depth of 6 inches unless otherwise indicated with equipment shielded according to requirements presented in the ESS.

3.3.1 SEAD 46 SRA

In the one acre SRA to the northwest of SEAD 46, fourteen 3-foot by 10-foot test pits totaling 24 cubic yards (cys) of soil were excavated to investigate the source of the saturated geophysical response. These test pits revealed only non-military CD such as broken pottery and glass, animal bones, and rusted farm debris. It is believed that this debris was dumped there prior to the construction of the Seneca Army Depot (1941 – 1942) and was likely placed there by prior occupants of the property. The test pits were backfilled and a surface sweep of the area was performed by the SUXOS and dig teams to verify no MPPEH was present within the boundaries of this SRA. It was confirmed and this area was considered free of MPPEH. The remainder of the previously identified EM anomalies in this area were found to be cultural debris and small arms MD.

3.3.2 SEAD 46 Berm

Twelve inches of soil totaling 298 cys was excavated from the front face of the berm at SEAD 46. After the first foot of soil was removed and transported to the lay down area, the dig teams and SUXOS swept the remainder of the hill with a Fisher metal detector to determine if most of the

metallic debris had been removed by the initial excavation. As a result of the sweep, only non-military, small arms (0.50 caliber bullets and other assorted bullets) and cultural debris were encountered. To further investigate this area, a deeper test pit was excavated in the center of the berm where soil staining was observed. A wooden stand was found and removed, and based on historic photographs it is believed that this test stand was used to hold the rocket motor of the 3.5" rocket during function testing of the motor assembly. No 3.5" rocket warheads or motors were found at this AOC, only what appears to be the function tests stand built into the backstop. The SUXOS determined that no MPPEH was present in the remainder of the SEAD 46 berm.

3.3.3 SEAD 57 SRA

Excavation was planned for a 12 acre area surrounding the berm at SEAD 57. Initially, a small portion of the total area was excavated using a shielded excavator. A total of 532 cys of material was excavated and stockpiled. During excavation, aluminum fragments similar to those found outside the planned excavation area were found in the excavated material. These aluminum fragments were determined to be from the M-123 photo flash pyrotechnic device. SEAD 57 was used to dispose of an unknown quantity of these devices.

An alternative clearance process was employed upon determination that the majority of anomalies were non-ferrous, aluminum fragments resulting from flares and photoflash devices. A magnetometer survey was performed on this SRA and all anomalies detected by the magnetometer in this area were investigated. Of the 1,164 targets investigated in the SEAD 57 magnetometer survey, 1,036 were cultural debris, 117 were MD, and 11 were MPPEH later determined to be MD after venting.

3.3.4 SEAD 57 Berm

Twelve inches of soil totaling 126 cys was removed from the surface of the SEAD 57 berm using a shielded excavator. Following removal of the soil from the berm area, the entire berm (interior and exterior face) and interior floor was surveyed using a Fisher all-metal detector for any remaining MPPEH/MD.

The post-excavation sweep found evidence of pyrotechnic flares and an empty 155 mm projectile. The flares were later determined to be Mk25 drift signals that had been previously subjected to an open burning procedure, with only the empty case and the flotation chamber intact. The 155 mm projectile consisted of the case only, and it was badly damaged from previous demolition procedures.

Charcoal and charred soil was discovered in the center of the bermed area floor. This area was over excavated to the underlying bedrock to remove all of the burned material and stained soil. In the remains of this burn pit were several M73 LAW rocket motors, M25 drift signal cases and various linked ammunition, all in the unfired blank configuration. The burn pit excavation totaled 42 cys of material.

All excavated material was transported to the SEAD 57 soil screening area for processing.

3.4 SOIL SCREENING AND PROCESSING

The objective of the soil screening process was to separate ferrous MPPEH and MD from the excavated soil removed from the SEAD 46 and 57 SRAs.

As a trial run for the screening plant, approximately 10 cys of stockpile material from SEAD 57 was run through the plant to determine the optimum throughput for the separation process. Based on this test run, it was determined that the screening plant would not remove the majority of MD (consisting of aluminum fragments). Therefore, it was not cost-effective to use this process to reduce the amount of soil requiring inspection by the UXO teams.

3.4.1 Excavated Soil Inspection

The stockpiled soil that was not screened and the oversize material from the test run was transported from the stockpile area to the lay down area and pushed out in 1-foot lifts using a shielded bulldozer. The lifts were subsequently cleared by UXO Technicians using the Schonstedt GX-72 magnetometer to identify individual items within the excavated material. In addition, QC checks were performed on 10 percent of the grids with a Fisher all-metal detector. All excavated soils were inspected using this process.

3.5 GEOPHYSICAL MAPPING

Geophysical surveys were performed at the four AOCs during the two separate mapping efforts cited previously in Section 2 to identify and target anomalies for intrusive investigation. In accordance with the ESS, the specific objective of the mapping effort was to identify all possible MPPEH items to a clearance depth of 3 feet based on meeting the detection limits of the geophysical prove-out grid. The results of this prove-out are presented in **Appendix A**.

Previously, EM61-MKII data was collected by Shaw in April 2005 at SEADs 46 and 57. Shaw identified 5,746 anomalies in SEAD 46 and 57 that required investigation/removal.

As part of this project, additional geophysical mapping was performed at SEAD 57, SEAD 007-R-01 and SEAD 002-R-01 to supplement the previous data collection efforts. Additional surveys were conducted in an area adjacent to SEAD 57 and local training areas adjacent to the Grenade Range. The area north of SEAD 57 between the 1,000 foot SEAD 57 radius and the 2,100 Open Detonation Grounds radius was surveyed since this area was used by EOD units for training and demolition (**Figure 3-2**). This area was not previously identified in the ESS as an area of concern. This area is referred to as the SEAD 57 Buffer Area.

In the Grenade Range, additional geophysical surveys were also performed between the firing line and the target area where meandering path surveys had previously been performed during the 2000 investigation. Further, meandering path surveys were used at a series of local training areas east and southeast of the Grenade Range (**Figure 3-6**). Local Training Areas B through L were investigated due to their proximity to the Grenade Range. There was no previous indication of MPPEH and they were not identified in the ESS as areas of concern. The Army believed it was prudent to investigate these adjacent areas.

Finally, EOD Area 2 was completely resurveyed during this project to verify data previously developed during the OE EE/CA in 2000.

The additional geophysical surveys were completed using a Geometrics G858 gradiometer and EM61-MKII towed array. The extent of geophysical investigations completed at all of the subject munitions response sites (SEAD 46, SEAD 57, SEAD 007-R-01 and SEAD 002-R-01) during the three investigative phases (OE/EE/CA, Geophysical Investigation and Munitions Response) are summarized in **Table 3-1**.

As a result of the additional geophysical investigations, an additional 4,256 targets were identified for investigation/removal resulting in 10,002 anomaly targets investigated during this removal effort. An additional 1,737 anomalies were investigated using “mag and flag” techniques resulting in a total of 11,739 investigations. A breakdown by area of the investigated targets is presented in **Table 3-2**.

The intrusive investigation summary presented in **Table 3-2** represents the number of reacquired target locations that were investigated during geophysical anomaly investigation and clearing activities. The results of the surveys conducted on the 224,000 square feet of woods transects are shown on the table in **Appendix B**. **Figures 3-8-through 3-12** show the locations of all identified anomalies targeted for investigation and the woods transects.

3.6 GEOPHYSICAL INSTRUMENT PROVE-OUT

Grids consisting of numerous seed items were established during previous geophysical survey efforts at Seneca. The prove-out grids contain a number of different objects of varying sizes that are set at pre-defined depths that reflect the expected items and depths of items likely to be encountered at the areas covered under this task order. This test grid procedure is utilized to determine peak detection and cut-off levels, and to verify the equipment is capable of performing the work as stated in the ESS. The geophysical data collected over two of the three existing prove-out grids used previously during the EE/CA and Time Sensitive Geophysical Investigation was compared to the previous data collection for depth of detection and positional accuracy. The prove-out grids were surveyed in May, July and September 2007. Results of this investigation are provided in **Appendix A**.

3.7 ANOMALY INVESTIGATION

Intrusive investigations of identified anomalies based on collected geophysical data were performed using two, three member teams of pre-qualified UXO technicians working under the supervision of the Senior UXO Supervisor (SUXOS). The identified geophysical anomaly locations from the collected geophysical data were converted from X, Y coordinates to a local coordinate system based in the State Plane system for Central New York (North American Datum 1983, Central New York). The northing and easting locations were uploaded to the Trimble 5700 DGPS survey equipment to be physically located by a surveyor in the field. Once the identified location was found, the surveyor placed a plastic pin flag at the location +/- 0.5 feet. The anomaly ID was written on the pin flag so the anomaly could be identified when it was reached in the field by the dig teams. After the location was marked out, the reacquisition team returned to the location with the EM61-MKII equipment to verify that the location and anomaly response were accurate for the selected anomaly. This process

verified that all anomalies that the dig teams were sent to investigate were relevant and no positioning or processing error was encountered in the data collection process.

Once all of the identified anomalies for a given grid were reacquired and verified in the field, the three member UXO technician dig team investigated the location by hand digging the anomaly to identify its source. The results of the investigation were then recorded electronically on a personal digital assistant (PDA) device. All spoil materials were left on the surface to allow for post investigation QC inspection of the open excavation. If MPPEH was encountered during the investigation, it was sandbagged and moved to the storage bunker at the end of the day. All ferrous cultural debris and MD were removed and placed in the scrap bin, which was subsequently disposed of upon completion of the project as non-hazardous scrap metal. Each location was cleared in a 24-inch radius of the flag using Schonstedts.

All anomalies targeted at each of the four AOCs covered in this project were investigated by the dig teams. During the anomaly investigation summary process, the anomaly ID number, material type (MPPEH, MD, cultural debris, or non-contacts), location from pin flag, and depth information were recorded by the UXO technicians on the PDA. These data were subsequently uploaded to the database at the end of each day.

A summary of the anomaly investigation results is provided in **Appendix C**. A total of 11,739 anomalies were intrusively investigated by the dig teams. The breakdowns of items by type were MPPEH (308), MD (4,532), and cultural debris (6,899). The MPPEH items were further investigated and only two MEC items were identified. Of the 306 MPPEH items found during the removal effort, all were encountered in the top 10 inches of soil. The two items that were classified as MEC were one fused and unfired 37mm projectile and one MKII Grenade. A list of all 9,999 anomalies and the result of the investigation are provided in **Appendix C**.

3.8 GEOPHYSICAL QUALITY CONTROL / QUALITY ASSURANCE

The UXO QC/Safety Supervisor conducted a QC audit in accordance with the work plan QA/QC requirements. This audit included placing items at the AOCs prior to data collection to determine if they could be relocated, and a surface and subsurface check of a minimum of 10% of the anomalies investigated. In order to accomplish this, 10% of the investigated anomalies were revisited by the UXO QC and screened with the Fisher ID Exel™ all metal detectors to verify the dig teams had removed the item(s) causing the anomaly from the location.

The pass/fail criteria for clearance specified that a location would fail if, during the QC audit, a MPPEH item was found. Based on this requirement, all of the grids passed Parsons' Analog QC inspection. If a ferrous object was found, the dig team would redo the work performed that day.

Throughout the subsequent 10% QC checks of the investigated locations, only one location had a piece of MD that was not removed by the dig team investigation. As a corrective action, all the anomalies that the team had investigated that day were revisited to confirm they were cleared by the team and passed subsequent QC. No rework was required if a non-ferrous object was found during QC.

Geophysical survey QA was performed by placing simulant seed items in the geophysical mapping survey area. Additional QA was performed during the geophysical prove-outs as discussed in Section 3.6. The seed items were sections of 1-inch by 3-inch steel and 1.6-inch by 3-inch aluminum pipe placed at known locations to provide a QA check of the identification, removal and detection procedure. The locations of the buried items were surveyed using the GPS at the time of burial and a table was made of the seed item locations and orientation (see **Table 3-3**). As part of the geophysical data processing, the chosen anomaly target locations were compared to the northing and easting location of the seed items. The detection of a known item location was compared to the known (surveyed) location of the seed item. This process allowed a running QA check of the geophysical data location accuracy.

Figures 3-13 and 3-14 and Table 3-3 show and summarize the location, depth, and orientation of each seed item that was placed in each area. At SEAD 007-R-01, a mix of 65 aluminum and ferrous simulant items were placed prior to data collection. All 65 items were identified during data collection and subsequently located during intrusive investigations.

At SEAD 57, 60 aluminum and ferrous simulant items were placed prior to geophysical data collection. During data collection, all 60 of the items were identified in the data but only six were investigated due to the high density of aluminum MD at the site.

4.0 ENVIRONMENTAL MEDIA INVESTIGATIONS

4.1 SOIL SAMPLING METHODOLOGY

Soil samples were collected and analyzed for chemical constituents as part of the Munitions Response project. Samples of soil from 3.5" Rocket Range (SEAD 46), the Former EOD Range (SEAD 57), the Grenade Range (SEAD 007-R-001), and EOD Areas 2 and 3 (SEAD 002-R-01) were collected in accordance with soil sampling procedures identified in Section 4 of the Munitions Response Work Plan and Explosives Safety Submission (WP), and Section 16.4.3.2 of the Site-wide Sampling and Analysis Plan, Munitions Response and CERCLA Closure (SAP). Seventy-five (75) soil samples were collected from the four AOCs. These included:

- one soil sample from the lay down material that was created from the soil that excavated from the berm at the 3.5" Rocket Range (SEAD 46) and processed for MEC/MPPEH removal;
- five soil samples from the soil that was excavated from the berm at the Former EOD Range (SEAD 57) that was processed for MEC/MPPEH;
- six soil samples from the soil excavated from the historic burn pit at the Former EOD Range (SEAD 57);
- forty-two characterization soil samples collected from the Grenade Range (SEAD 007-R-001); and,
- twenty-one characterization soil samples from the EOD Areas 2 and 3 (SEAD 002-R-01).

A summary of the soil sampling activity performed at each site for the Munitions Response project is provided below.

4.1.1 3.5" Rocket Range (SEAD 46)

The soil at SEAD 46 was previously characterized as part of a Remedial Investigation (RI) conducted between 1999 and 2000. During this work, soil from test pits, soil borings, surface soil locations and drainage channels (i.e., ditch soil) at the AOC were collected and characterized for hazardous substances (TCL VOCs, SVOC, pesticides and PCBs, TAL metal, and nitroaromatic and nitroamine compound content). Based on the RI work, which is discussed in greater detail in the report Draft "*Remedial Investigation Report for SEAD-46 and SEAD-57*" (Parsons 2001), metals were identified as the principal constituents of concern. However, review of the available data indicated that detected levels were generally consistent with levels found in the SEDA background soil data set. Based on the analytical data collected during the RI, the Army decided that additional soil samples were not needed from the 3.5" Rocket Range except in cases where a high density of suspect UXO anomalies were identified which required the soil to be excavated and processing for the removal of UXO items. When soil was excavated for processing, one confirmation soil sample was required for each 500 cys or less of excavated soil per provisions identified in the WP.

Soil from the top 6 to 12 inches of the southern face of the target berm at SEAD 46 was removed and transported to a location along the eastern edge of SEAD 57, south of the east-west access road where

it was stockpiled pending inspection and processing by UXO personnel. The excavated soil was laid out in a 1-foot lift to allow personnel to search for and identify UXO items. After the laid out soil was certified as free of MPPEH by the SUXOS, one confirmation soil sample was collected from a random location within the lift on August 29, 2006 from a depth of 0 - 2 inches below the top of the lift level. The sample was submitted to Columbia Analytical Services (CAS) for Target Analyte List (TAL) metals analysis.

4.1.2 Former EOD Range (SEAD 57)

The soil at SEAD 57 was previously characterized as part of the 1999/2000 RI, as well as part of an Expanded Site Inspection (ESI) conducted in 1993/1994. Soil samples collected during past investigations the included surface soils, subsurface soil from soil borings and test pits, and ditch soil from drainage gullies and swales located at the AOC. Again, metals were the principal constituents of concern detected at the AOC, but concentrations found were generally consistent with metal levels found in SEDA background soil. Based on the results collected during the prior investigations at SEAD 57, the Army decided that additional samples from the shallow soil were not needed for the majority of this AOC.

Two types of samples were collected from soil during the Munitions Response project at SEAD 57; confirmatory soil samples were collected from the base and the walls of the excavated Burn Pit area inside the SEAD 57 berm; and samples were collected from soil that was excavated for subsequent inspection and MEC and MPPEH processing by UXO personnel.

Five samples and one sample duplicate were collected from the excavated Burn Pit on July 24, 2006; four samples and a sample duplicate were collected from locations at the mid-points of the four side walls (sidewall depths ranged from 3.5 - 4 feet below ground surface ([bgs]), and one sample was collected from the floor of the excavated area. All soil samples were collected from 0 to 2 inches below the surface of the side wall soil and floor. The six samples from the Burn Pit excavation were submitted to the laboratory for the analysis of Target Compound List (TCL) volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), TAL metals, and nitroaromatics and nitramines.

The top 12 inches of soil (approximately 126 cys) from all exposed surfaces of the berm structure at SEAD 57 was scraped off and transported to the eastern edge of the AOC for subsequent inspection and processing by UXO personnel. In addition, the soil (approximately 42 cys) excavated from the historic Burn Pit inside the berm (see paragraph above) was transported to the staging area where it was mixed with the soil from the berm, prior to being laid out in a single lift for inspection and processing by UXO personnel.

Furthermore, shallow soils were excavated from two areas identified as SRAs located to the west and southwest of the SEAD 57 berm. This soil was subsequently transported to the staging area in the northeast corner of the AOC, where it was combined and laid down in a single lift for inspection and processing by UXO personnel. The total volume of soil excavated from these two areas was 385 cys.

Once all of the stockpiles of SEAD 57 related soils were certified free of MPPEH by the SUXOS, confirmation soil samples were collected and analyzed for metal constituents. Per specifications of the WP, one confirmation soil sample was required per 500 cys of soil. Confirmatory soil samples from the laid out material were collected on August 29, 2006. A single confirmation soil sample was collected 0 - 2 inch bgs from the SEAD 57 berm soil and excavated Burn Pit soil. Three hundred and eighty-five yards (385 cys) of this soil was transported to the staging area where it was laid out for inspection and processing. The remainder of the excavated soil from a SRA located to the south of the berm was subsequently backfilled in place. The 385 cys of SRA soil was sub-divided into three equal areas and a surface sample (0 - 2 inch bgs) was collected from each of the three sub-divisions. Three soil samples and one sample duplicate were collected from the surface (0 - 2 inches bgs) of the SRA soil. The samples were submitted to the laboratory for TAL Metals analysis.

4.1.3 Grenade Range (SEAD 007-R-001)

Forty site characterization samples and two sample duplicates were collected from the Grenade Range (SEAD 007-R-001) during the Munitions Response project. Site characterization sample locations were chosen in accordance with the WP. The surface soil samples (0 - 2 inch bgs) were collected on December 12th and 13th, 2006 in accordance with the WP and SAP.

4.1.4 EOD Areas 2 and 3 (SEAD 002-R-01)

Twenty site characterization soil samples and one sample duplicate were collected from the Rumored EOD Range (SEAD 002-R-01) during the Munitions Response project. The Rumored EOD Range is split into two pieces (i.e., EOD Area 2 and EOD Area 3) by the Duck Pond. EOD Area 2 is located to the west of the pond and EOD Area 3 is located to the east of the pond. Site characterization sample locations were chosen in accordance with the WP. Twelve soil samples were collected from EOD Area 2; and eight soil samples and one sample duplicate were collected from EOD Area 3. All site characterization soil samples were surface samples (0 - 2 inch bgs) collected on December 11th and 12th, 2006 in accordance with the WP and SAP.

5.0 ORDNANCE AND EXPLOSIVES DEMILITARIZATION AND DISPOSAL

All MD and scrap metal items collected by UXO technicians on a daily basis were transferred to a staging area, inspected by both the SUXOS and UXO QC Supervisor, and placed into a locked storage area for temporary storage. Additional inspections were performed by the Senior UXO Supervisor (SUXOS), and again by the Senior QC (UXOQCS) Supervisor prior to being transferred to drums where a 1348-1A form was issued. Section 5.2 describes the final disposal procedures for all explosives and MD scrap metal

5.1 INTENTIONAL DETONATIONS

Demolition operations for MPPEH were conducted at the Open Detonation Hill (OD) to the north of the former Open Burning Grounds (OBG). In accordance with “Procedures for Demolition of Multiple Rounds (Consolidate Shots) on UXO Sites”, dated August 1998 and approved by DDESB on 27 October 1998. Explosives Consumption Records are included in **Appendix D**. A table showing the suspected MPPEH items and the date they were vented is included as **Table 3-2**. Venting with a shape charge was used to distinguish MEC from MD.

All demolition explosives were transferred from the Army to Parsons/USA Environmental and kept in a secure storage bunker provided by the Army. All explosives were inspected weekly while in storage and transported in accordance with the State of New York’s Department of Labor, Industrial Rule 39 and the Department of Treasury, Bureau of Alcohol, Tobacco, and Firearms (ATF) regulations.

5.2 OTHER DEMILITARIZATION PROCEDURES

All projectiles and intact MD were demilitarized by either explosive venting or by the removal/deformation of the rotating bands and fuse wells following inspections.

Following venting of all MPPEH items, thermal treatment of small arms, and/or physical demilitarization procedures, all items were disposed of off-site. A total of 4,180 pounds of cultural debris scrap metal, 618 pounds of aluminum MD and 2,689 pounds of ferrous MD scrap metal was disposed off-site. A 1348-1A form, chain of custody form, and certificate of destruction for this material is included in **Appendix D**.

5.3 DEMOBILIZATION

Demobilization of UXO personnel occurred in November 2006 following completion of the 10% QC inspection for all six areas.

6.0 SOIL INVESTIGATIONS

Soil sampling was conducted as part of the Munitions Response and CERCLA Closure work to accomplish the following:

- Demonstrate that soils remaining at the sites had not been significantly impacted by site activities at SEAD 007-R-01 and SEAD 002-R-01 since no previous sampling had been performed at these sites.
- Confirm that screened soil from SEAD 46 and SEAD 57 met site cleanup goals so it could be used as backfill on-site.

During this project, the Army collected and analyzed 21 soil samples and duplicates from SEAD 002-R-01, including 12 from EOD Area 2 and nine from EOD Area 3; and 42 soil samples from SEAD 007-R-001 (Grenade Range). All of these samples were analyzed for Target Compound List (TCL) volatile organic compounds (VOCs, 49 compounds), semivolatile organic compounds (SVOCs, 65 compounds), pesticides (21 compounds), polychlorinated biphenyls (PCBs, 7 compounds); Target Analyte List (TAL) metals (23 analytes); nitroaromatics and nitroamines (16 compounds); and nitrate/nitrogen. A full listing of all of the analytes characterized in these samples is provided in **Table 6-1**. In addition, six samples were collected from the disposal pit excavation completed at SEAD 57 to determine if the disposal pit contents had contaminated the adjacent soils above site cleanup goals. Each of these samples was characterized for the same analytes as are listed above. Finally, six samples were collected from the excavated berm soils at SEAD 46 and SEAD 57 to determine if the soils could be backfilled; these samples were characterized for only TAL metals.

Results for VOC, SVOC, pesticide, PCB, and nitroaromatic or nitroamine compounds were compared to NYSDEC's Title 6 NYCRR Subpart 375-6.8(a) Unrestricted Use soil clean-up and adjusted USEPA Region IX Preliminary Remedial Goals (PRGs) for Residential Soil (October 2004 version). Analytical results for metals with comparative criteria were compared to the larger of NYSDEC's Unrestricted Use clean-up/SEDA-specific background sample results and to the larger of the adjusted Region IX PRG/SEDA-specific background sample results. In all cases, the USEPA's Region IX PRG values for residential soil were used at face value for carcinogenic compounds, while non-carcinogenic values were used at a level of one-tenth their face value. For simplicity in the ensuing discussion the combination of NYSDEC's Unrestricted Use clean-up/SEDA-specific background sample results will be referred to as NYSDEC/SEDA values, while the combination of the Region IX PRG/SEDA-specific background sample results will be referred to as EPA/SEDA values

Additional sampling and analysis had previously been performed at SEAD 46 as part of an RI that was performed between late 1999 and mid 2000, and during an RI (1999/2000) and an ESI performed at SEAD 57, the Explosive Ordnance Disposal Area, in 1993 and 1994. The samples collected at SEAD 46 and SEAD 57 included samples of soil, surface water, groundwater, and ditch soil, as well as building debris samples from a location within SEAD 57. Each of the soil samples collected at SEAD 46 and SEAD 57 were analyzed for TCL VOCs (33 compounds), SVOCs (65 compounds), pesticides/PCBs (28 compounds total including 21 pesticides and 7 PCBs); TAL metals (23

compounds) and cyanide; nitroaromatics and nitroamines (14 compounds); and nitrate/nitrogen. Additionally, soil samples collected at SEAD 57 during the ESI (1993) were also analyzed for herbicides (10 compounds). A full listing of all of the analytes characterized in these samples is provided in **Table 6-2**.

Groundwater and surface water samples were also collected from SEAD 46 and SEAD 57 and characterized for VOCs, SVOCs, nitroaromatic and nitroamines, pesticides and PCBs, metals and cyanide, as well as nitrate/nitrogen.

The results of the sampling and analysis performed at the varying locations are provided in the following sections.

6.1 GRENADE RANGE (SEAD 007-R-01)

The locations from which surface soil samples were collected at the Grenade Range (SEAD 007-R-01) are shown on **Figure 6-1**. The summary table presenting the collapsed data set for the Grenade Range based only on compounds detected in the samples is provided in **Appendix E Table 1A**. The complete data set for soil samples collected from the Grenade Range is provided in **Appendix E Table 1B**. A simplified summary listing of the soil sample data highlighting only those analytes or compounds that were found at concentrations above the varying comparative criteria identified above is provided as **Table 6-3**.

A brief summary of the Army's findings from its review of the available data is provided below.

Pesticides and PCBs, as well as nitroaromatic and nitroamine compounds, were not detected in any of the surface soil samples (0 – 2 inches below grade) collected from the Grenade Range. Eight VOCs were detected one or more times in the soil samples collected from the Grenade Range. Acetone and 2-butanone (i.e., methyl ethyl ketone) were the two compounds most frequently detected at the Grenade Range, present in 41 and 38 of the 42 samples characterized, respectively. Other VOCs detected included methylene chloride (31 times), toluene (11 times) tetrachloroethene (4 times) and cyclohexane, methyl acetate, and methyl butyl ketone (1 time each). Acetone was measured at the highest individual sample (290 µg/Kg) and overall highest average (102 µg/Kg) concentration. Methyl ethyl ketone was the found at a maximum concentration of 63 µg/Kg, and an overall average concentration of approximately 12 µg/Kg. None of the other VOCs were detected at a concentration above 12 µg/Kg in any of the samples analyzed.

Acetone was the only compound observed to exceed its NYSDEC Unrestricted Use criteria value. Thirty-two samples contained concentrations above acetone's unrestricted use level of 50µg/Kg. None of the acetone concentrations measured exceeded EPA's adjusted Region IX PRG for residential soil.

Available technical literature² indicates that soil samples treated with the preservative sodium bisulfate during the sample collection and analysis sequence generates acetone in the sample that is not present in the undisturbed soil. The Army's believes that the acetone observed in soil samples from SEAD 007-R-01 results from this source. There is no historic information that indicates that acetone was ever used or stored at this site, and its ubiquitous presence in surface samples from throughout the site makes its detection suspect. Furthermore, the general lack of other organic compounds in soil samples throughout the site make it highly unlikely that it is present as a contaminant to the other organic chemicals detected at the AOC. Finally, acetone is a common laboratory contaminant and trace levels of this compound were found in sample blanks run during the analysis.

Two SVOCs, 2,4-dinitrotoluene and benzaldehyde were detected once each in the surface soils characterized from SEAD 007-R-01. The 2,4-dinitrotoluene was detected at a concentration of 430 J³ µg/Kg; it was not detected in the duplicate sample (i.e., 450 U⁴ µg/Kg) that was collected from location 007-R-01-1037. Benzaldehyde was detected at a concentration of 420 J µg/Kg at sample location 007-R-01-1038. These compounds were detected in two different samples collected from location in the north-central and northwestern portions of the AOC (refer to **Figure 6-1**). NYSDEC has not identified an Unrestricted Use criteria value for either of these compounds. Neither of these compounds were found at concentrations that exceeded the adjusted EPA PRG values for residential soils.

Twenty metals were detected in the soil samples collected from the Grenade Range. Seventeen of the metals (i.e., Al, As, Ba, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Se, V and Zn) were detected in every sample characterized. The other three metals were found in more than half of the samples, each. Selenium was the only metal detected in soil samples from the Grenade Range that was observed to exceed NYSDEC/SEDA comparative values, and this was observed in two samples. The 95th UCL for selenium computed for the data set from the Grenade Range did not exceed the NYSDEC/SEDA value. None of the levels of metals detected at the Grenade Range surpassed the EPA/SEDA comparative values. Based on its review and analysis of the available soil data, it is the Army's position that the soil at SEAD 007-R-001 (Grenade Range) has not been impacted by historic operations and activities performed at this site. The Army believes that the analytical results developed from the soil samples collected demonstrate that the soil remaining at the site is consistent

³ The use of a "J" qualifier for the data indicates that the concentration represents an estimated value.

⁴ The use of a "U" qualifier for the data indicates that the compound was not detected at the indicated concentration.

with the unrestricted clean-up goals established prior to the beginning of the work at SEAD 007-R-001. Therefore, the Army does not believe that further action is needed at this site.

6.2 SEAD 002-R-01, EOD AREA 2 and 3

SEAD 002-R-01 consists of two smaller areas, identified as EOD Area 2 and EOD Area 3. The two areas are located in the north-eastern portion of the depot and they are separated from one another by the Duck Pond. The complete data set for soil samples collected from EOD Area 2 is provided in **Appendix E Table 2B**. The complete data set for soil samples collected from EOD Area 3 is provided in **Appendix E Table 3B**.

6.2.1 EOD Area 2

The locations from which surface soil samples were collected at EOD Area #2 (SEAD 002-R-01) are shown on **Figure 6-2**. A summary table presenting the collapsed data set based only on compounds detected in the samples collected within EOD Area 2 is provided in **Appendix E Table 2A**. The simplified summary listing of the soil sample data that highlights compounds that exceed the varying comparative criteria identified above for EOD Area 2 is provided as **Table 6-4**.

Pesticides and PCBs, as well as nitroaromatic and nitroamine compounds, were not detected in any of the surface soil samples (0 – 2 inches below grade) collected from EOD Area 2. Eight VOCs were detected one or more times in the soil samples collected from EOD Area 2. Methylene chloride (12 times), methyl ethyl ketone (11 times) and acetone (10 times) were the three VOCs most frequently detected in the samples collected from EOD Area 2. Other VOCs detected included toluene (3 times), and carbon disulfide, cyclohexane, methyl acetate, and methyl cyclohexane (1 time, each).

Acetone was measured at the highest individual sample (100 µg/Kg) and overall highest average (63.5 µg/Kg) concentration. None of the other VOCs detected were found at a concentration above 3 µg/Kg.

Acetone was observed to exceed NYSDEC's Unrestricted Use criteria value (i.e., 50 µg/Kg) in eight of the samples in which it was detected. However, as the Army has stated above in Section 4.1, the reported levels of acetone present in these samples are presumed to be artifacts of the sample preservation and analysis procedure used, or laboratory contamination. There are no records or evidence to indicate that acetone was ever used or stored in this area of the depot, and the lack of other organic compounds further suggest that it is not present as a co-contaminant.

Seventeen SVOCs, including the seven carcinogenic polyaromatic hydrocarbons (cPAHs), were detected either once (2 compounds) or twice (15 compounds) each in the 12 confirmatory soil samples characterized for EOD Area 2. All of the SVOCs detected were identified in the two samples collected from locations 002-R-01-1007 or 002-R-01-1008, which are located near the center or east center portions of the site (see **Figure 6-2**). The sample collected from location 002-R-01-1007 (center of the site) contained the maximum concentration for all of the SVOCs detected, exclusive of naphthalene, which was detected at its maximum level in the sample collected from 002-R-01-1008. Twenty-nine of the concentrations reported for the SVOCs were identified as estimated

(i.e., “J” qualified data) results. Fluoranthene was the PAH found at the highest individual sample concentration (750 µg/Kg). None of the detected PAH compounds were identified at concentrations that exceeded their respective Unrestricted Use criteria levels. The maximum concentration of benzo(a)pyrene toxicity equivalents (BTEQs) found in any sample from the site was identified at location 002-R-01-1007 with a level of 0.454 mg/Kg; this is well below NYSDEC’s guidance value of 10 mg/Kg. The 95th UCL concentration computed for two cPAH compounds, benzo(a)pyrene (246 µg/Kg) and dibenz(a,h)anthracene (238 µg/Kg), were observed to exceed their respective, adjusted Region IX criteria values (each 62 µg/Kg), but in both cases this is an artifact of blending non-detect levels with limited results from samples where the compounds were found to be present. The maximum concentration of benzo(a)pyrene found in any sample was 410 “J” µg/Kg, and the maximum concentration of dibenz(a,h)anthracene detected in any sample from EOD Area 2 was 59 “J” µg/Kg.

Nineteen metals were detected in the soil samples collected from EOD Area 2. Seventeen of the metals (i.e., Al, As, Ba, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Se, V and Zn) were detected in every sample analyzed. The other two metals were found in more than two-thirds of the samples collected and characterized.

Manganese was the only metal found at a level that exceeded its NYSDEC/SEDA unrestricted use criteria level of 2,380 mg/Kg. Manganese was found in one sample at a concentration of 2,770 mg/Kg, and this single sample represents the only time any of the NYSDEC/SEDA criteria values was exceeded in EOD Area 2. The computed 95th UCL for manganese (1,512 mg/Kg) at EOD 2 was below the NYSDEC/SEDA comparative value. None of the 95th UCL values computed for any of the metals found in soil at EOD Area 2 was found at a level in excess of the EPA/SEDA criteria levels (See **Table 6-4**).

Based on its review and analysis of the available soil data, it is the Army’s position that the soil at EOD Area 2 has not been impacted by historic operations and activities performed at this site. The Army believes that the analytical results developed from the soil samples collected demonstrates that the soil remaining within this portion of the overall site is consistent with the unrestricted use clean-up goals established prior to the beginning of the work at the EOD Areas. Therefore, the Army does not believe that further action is needed at this location.

6.2.2 EOD Area 3

The locations from which surface soil samples were collected at EOD Area #3 (SEAD 002-R-01) are shown on **Figure 6-3**. The summary table presenting the collapsed data set based only on compounds detected in the samples is provided in **Appendix E Table 3A**. The complete data set for soil samples collected from EOD Area 3 is provided in **Appendix E Table 3B**. A simplified summary listing of the soil sample data highlighting only those analytes or compounds that were found at concentration above the varying comparative criteria identified above is provided as **Table 6-5**.

SVOCs, pesticides and PCBs, as well as nitroaromatic and nitroamine compounds were not detected in any of the surface soil samples (0 – 2 inches below grade) collected from EOD Area 3. Eight

VOCs were detected one or more times in the confirmatory soil samples collected. Acetone and methylene chloride were both detected in all nine samples, while methyl ethyl ketone was detected in seven of the nine soil samples characterized. Other VOCs detected included toluene (2 times), and benzene, carbon disulfide, cyclohexane, and methyl cyclohexane (1 time, each). Acetone was measured at the highest individual sample (260 µg/Kg) and overall highest average (94.7 µg/Kg) concentration. Methyl ethyl ketone was found at a maximum concentration of 23 µg/Kg, while none of the other VOCs detected were found at concentrations above 3 µg/Kg. Acetone was also the only compound observed to exceed any of the cleanup criteria evaluated, present at levels in excess of NYSDEC's Unrestricted Use criteria value (i.e., 50 µg/Kg) in six of the samples. The Army believes the acetone results as an artifact or contaminant of the sampling and analysis process.

Nineteen metals (i.e., Al, As, Ba, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Se, V and Zn) were detected in the soil samples collected from EOD Area 3. None of the detected metals were observed at concentrations that were in excess of their respective NYSDEC/SEDA comparative values. Comparably, none of the metals were found at concentrations that exceeded EPA/SEDA criteria values.

Based on its review and analysis of the available soil data, it is the Army's position that the soil at EOD Area 3 has not been impacted by historic operations and activities performed at this site. Therefore, no further action is needed.

6.3 SEAD 57 BERM PIT EXCAVATION

During the Munitions Response removal action, confirmatory soil samples were collected from the walls and floor of an excavation that was completed to remove residues found in a historic burn pit that was identified within the confines of the protective berm at SEAD 57. The excavated soil and debris found within the historic pit were processed as part of the munitions response effort, and the residual soil was added to the material that remains at SEAD 57 in the soil laydown area. Analytical results from the processed soil are discussed in Section 4.4 below.

The summary table presenting the collapsed data set based only on compounds detected in the samples is provided in **Appendix E Table 4A**. The complete data set for confirmatory soil samples collected from the burn pit at SEAD 57 is provided in **Appendix E Table 4B**. A simplified summary listing of the soil sample data highlighting only those analytes or compounds that were found at concentration above the varying comparative criteria identified above at the SEAD 57 Burn Pit excavation site is provided as **Table 6-6**.

SVOCs, pesticides and PCBs, as well as nitroaromatic and nitroamine compounds, were not detected in any of the soil samples collected from the excavation encompassing the former burn pit. Two VOCs were detected at least once each in the six soil samples collected from the former burn pit excavation. Tetrachloroethene was detected in four of the six samples collected; but in each case, the concentration measured was 1.7 µg/Kg or less, and each time the data was "J" qualified. Acetone was detected in one sample, at an estimated concentration of 2 µg/Kg. None of the detected VOCs were found at levels that exceeded their respective Unrestricted Use criteria levels.

Twenty-one metals were detected in the soil samples collected from the walls and floor of the former burn pit excavation. Of the 21 metals detected, 20 were found in every sample, while vanadium was detected in four of the six samples characterized. None of the metals found exceeded either their respective NYSDEC/SEDA or EPA/SEDA comparative values.

Based on its review and analysis of the available soil data, it is the Army's position that the soil in the area of the former SEAD 57 burn pit has not been impacted by historic operations and activities performed at this location. Therefore, no further action is needed.

6.4 SEAD 46 AND SEAD 57 LAY DOWN AREA SAMPLES

One foot of soil from the exterior surfaces of the backstop berm at SEAD 46, and from the Explosive Ordnance Disposal Area protective berm enclosure (SEAD 57) was excavated and processed to remove MD and MPPEH as part of the Munitions Response removal action. Once the excavated soil was surveyed and identified MD and MPPEH was removed, samples from the remaining soil were collected and characterized to determine residual levels of metal contaminants that were present.

The locations from which surface soil samples were collected at SEAD 46, the 3.5 inch Rocket Range are shown on **Figure 6-4**. The summary table presenting the collapsed data set based only on compounds detected in the samples is provided in **Appendix E Table 5B**. The complete data set for soil samples collected from the SEAD 46 and SEAD 57 soil stockpiles is provided in **Appendix E Table 5A**. A simplified summary listing of the SEAD 46 and SEAD 57 soil stockpile samples data highlighting only those analytes or compounds that were found at concentration above the varying comparative criteria identified above is provided as **Table 6-7**.

Twenty metals were detected in the soil samples collected from the soil stockpiles that were created from the MD/MPPEH processed soil. Of the 20 metals detected, 19 were found in every sample collected and analyzed, while selenium was detected in five of the six samples characterized. Zinc was the only metal found in the stockpiled soil that had a 95th UCL of the arithmetic average concentration (140 mg/Kg) that exceeded its NYSDEC/SEDA comparative value (126 mg/Kg). The elevated 95th UCL value for zinc is driven by the concentration reported (182 mg/Kg) for one of the six samples collected.

Based on its analysis of the available soil stockpile data, it is the Army's position that the soil has not been adversely impacted by historic operations and activities performed. Therefore, no further action is needed.

6.5 SEAD 46 REMEDIAL INVESTIGATION RESULTS

The data set for soil samples that remain at the SEAD 46 site is provided in **Appendix E, Table 6B**. This data set has been modified from that which was previously reported for SEAD 46 in the Draft "*Remedial Investigation Report for SEAD 46 and SEAD 57*" (Parsons 2001) to reflect the removal of several shallow soil samples that were originally collected from locations on the former backstop berm structure at SEAD 46. During the Munitions Response removal action, the top foot of soil was removed from the backstop berm and transported to the vicinity of SEAD 57 for MEC/MPPEH survey and processing. Once MEC/MPPEH was removed, the residual soil was sampled and the

samples were analyzed; the results of these analyses are discussed above in **Section 4.4** under the heading of “*SEAD 46 and SEAD 57 Stockpile Samples.*” The following samples and their associated data have been removed from the SEAD 46 RI data set: SS46-8, SS46-9, SS46-10, SS46-12, and SS46-14.

A summary table presenting the collapsed data set based only on compounds detected in the samples is provided in **Appendix E Table 6A**. A simplified summary listing of the SEAD 46 RI data highlighting only those analytes or compounds that were found at concentration above the varying comparative criteria identified above is provided as **Table 6-8**.

PCBs, as well as nitroaromatic and nitroamine compounds, were not detected in any of the soil samples collected from SEAD 46. Seven VOCs were detected one or more times in the soil samples collected from the SEAD 46. Acetone, toluene and methyl ethyl ketone were the three compounds most frequently detected at the site, present in 31, 29 and 24 of the 32 samples characterized, respectively. Other VOCs detected included carbon disulfide (12 times), benzene (7 times), total xylenes (7 times), and ethyl benzene (1 time).

Acetone was measured at the highest individual sample (410 µg/Kg) and overall highest average (i.e., approximately 215 µg/Kg) concentration. Methyl ethyl ketone was the found at a maximum concentration of 48 µg/Kg. None of the other VOCs were detected at a concentration above 20 µg/Kg in any of the samples analyzed.

Acetone was the only compound observed to exceed NYSDEC’s Unrestricted Use criteria. Twenty-seven samples were found to contain concentrations above the Unrestricted Use level (50 µg/Kg) for acetone. However, as has been discussed repeatedly above, it is the Army’s belief that some of the noted acetone found in these samples results due to sample preparation and processing procedures, and it is not indicative of releases that have occurred at the site.

Twenty SVOCs were detected in the soils characterized for SEAD 46. Pyrene (17 times), Fluoranthene (16 times), and benzo(b)fluoranthene, and benzo(k)fluoranthene (15 times each) were the compounds most frequently detected in the 31 samples analyzed. Di-n-butylphthalate was the SVOC detected at the highest concentration (i.e., 1,100 µg/Kg) in any single sample, followed by bis(2-ethylhexyl) phthalate (780 µg/Kg) and 2,6-dinitrotoluene (130 µg/Kg). Benzo(b)fluoranthene had the highest concentration (i.e., 47 µg/Kg) measured for any cPAH or PAH compound found at SEAD 46. None of the samples collected from this SWMU had any SVOC at a concentration in excess of their respective NYSDEC Unrestricted Use criteria levels. The maximum BTEQs concentration found in any of the samples was 0.242 mg/Kg, which is below NYSDEC’s guidance value of 10 mg/Kg. The 95th UCL value computed for benzo(a)pyrene (62.3 µg/Kg) was observed to exceed the Region IX PRG value (62 µg/Kg), but this value is skewed by non-detected values intermixed with low level detections. Benzo(a)pyrene was detected in 14 of the 31 samples collected at a maximum detected concentration of 30 “J” µg/Kg, which is less than the Region IX PRG value (62 µg/Kg) and the NYSDEC Unrestricted Use value (1,000 µg/Kg).

Nine organochlorine pesticides were detected one or more times in the soil samples collected from SEAD 46. PCBs were not detected in any of the soil samples characterized. Dieldrin was detected in 10 of the 32 soil samples characterized, 4,4'-DDE and endrin were found in three samples each, and alpha-chlordane was found in two samples. These were the only pesticides that were detected in more than one sample collected from the site. Dieldrin was also the pesticide found at the highest individual sample concentration, present at a maximum concentration of 46 J $\mu\text{g}/\text{Kg}$ in the sample collected from location SS46-11. Three of the detected pesticides, dieldrin (2 times), and 4,4'-DDD and 4,4'-DDE (1 time, each), were found at levels above NYSDEC's Unrestricted Use criteria levels. All of the noted exceedances for pesticide compounds were found in three separate locations of the site (i.e., SS46-7, SS46-11 and SS46-18) which are separated by distances of 200 to 400 feet. Both of the noted dieldrin exceedances were only slightly higher (i.e., 45 "J" and 46 "J" $\mu\text{g}/\text{Kg}$) than NYSDEC's Unrestricted Use clean up objective level (i.e., 40 $\mu\text{g}/\text{Kg}$) and both were reported as estimated concentrations. Similarly, the concentration measured for 4,4'-DDT was estimated at 3.7 $\mu\text{g}/\text{Kg}$, which again is only slightly above NYSDEC's Unrestricted Use cleanup objective of 3.3 $\mu\text{g}/\text{Kg}$. The exceedance reported for the 4,4'-DDE was 10 $\mu\text{g}/\text{Kg}$ versus a clean up objective level of 3.3 $\mu\text{g}/\text{Kg}$. The 95th UCL concentrations computed for all organochlorine compounds at SEAD 46 were below NYSDEC's Unrestricted Use criteria levels.

Twenty-three metals were detected in the soil samples collected from SEAD 46. Fifteen of the metals (i.e., Al, As, Ba, Be, Ca, Cr, Co, Cu, Fe, Pb, Mg, Ni, K, V and Zn) were detected in every sample characterized. Three of the remaining metals, manganese, mercury and thallium, were found in more than three quarters of the samples characterized, while the remaining five metals were found in fewer than half of the samples analyzed. None of the concentrations measured for metals were found to exceed the NYSDEC/SEDA criteria levels. The 95th UCL value computed for thallium (2.05 mg/Kg) was the only one that was observed to be higher than its EPA/SEDA criteria level (1.2 mg/Kg). Thallium was detected in 30 of the 31 samples collected from SEAD 46, at a maximum concentration of 3.7 mg/Kg.

Based on its review and analysis of the available soil data, it is the Army's position that the soil at SEAD 46 has not been impacted by historic operations and activities performed at this site. The Army believes that the analytical results developed from the soil samples collected demonstrates that the soil remaining at the site is consistent with the clean-up goals established prior to the beginning of the work at SEAD 46. Therefore, no further action is needed.

6.6 SEAD 57 EXPANDED SITE INSPECTION (1993) and REMEDIAL INVESTIGATION (1999/2000) RESULTS

The data set for soil samples that remain at the site is provided in Appendix E, Table 7B. This data set has been modified from that which was reported in the Draft "*Remedial Investigation Report for SEAD 46 and SEAD 57*" (Parsons 2001) to reflect the removal of shallow soil samples from two locations, and a test pit sample that were previously collected from areas that were excavated during the Munitions Response removal action. The test pit sample was previously collected from location TP57-5, which is coincident with the former burn pit that was excavated. This area was excavated to

a depth of greater than 3 feet to remove debris identified during the Munitions Response action. Results of confirmatory sampling from this area are summarized above in Section 4.3, SEAD 57 Burn Pit Excavation, above. One of the shallow soil samples was collected from a location (SS57-26) south of the berm structure, while the second was collected from the area west of the berm (SS57-4). Both of these areas were excavated to a depth of approximately 1 foot during the Munitions Response removal action to remove heavy concentrations of cultural anomalies that were subsequently manually scanned and sorted. The residual soil from these locations is currently contained in the lay down of soil that are discussed in Section 4.4, SEAD 46 and SEAD 57 Stockpile Samples, above.

The locations from which surface soil samples were collected at SEAD 57 are shown on **Figure 6-5**. A summary table presenting the collapsed data set based only on compounds detected in the samples is provided in **Appendix E Table 7A**. A simplified summary listing of the SEAD 57 data highlighting only those analytes or compounds that were found at concentration above the varying comparative criteria identified above is provided as **Table 6-9**.

Herbicide, nitroaromatic, and nitroamine compounds were not detected in any of the soil samples collected from SEAD 57. Nine VOCs were detected one or more times in the soil samples collected from the SEAD 57. Acetone, toluene and methyl ethyl ketone were the three compounds most frequently detected at the site, present in 94, 82 and 79 of the 127 samples characterized, respectively. Other VOCs detected included carbon disulfide (14 times), tetrachloroethene (7 times), total xylenes (3 times), methylene chloride and benzene (2 times each), and chloroform (1 time).

Acetone was measured at the highest individual sample (700 $\mu\text{g}/\text{Kg}$) and overall highest 95th UCL of the mean (~131 $\mu\text{g}/\text{Kg}$) concentration. Methyl ethyl ketone was the found at a maximum concentration of 64 $\mu\text{g}/\text{Kg}$, while toluene was detected at a maximum concentration of 33 $\mu\text{g}/\text{Kg}$. None of the other VOCs were detected at a concentration above 25 $\mu\text{g}/\text{Kg}$ in any of the samples analyzed.

Acetone was the only VOC observed to exceed NYSDEC's Unrestricted Use criteria, as it was found at concentrations above 50 $\mu\text{g}/\text{Kg}$ in 87 samples. The 95th UCL of the overall data set (195 $\mu\text{g}/\text{Kg}$) also exceeded NYSDEC's Unrestricted Use criteria value. However, the Army reiterates its belief that some if not all of the noted acetone results as an artifact of the sample collection and analysis process.

Soil samples collected from SEAD 57 were found to contain 22 SVOCs in one or more of the 118 soil samples characterized. Pyrene (62 times), Fluoranthene (60 times), and phenanthrene (44 times) were the SVOCs most frequently detected in the samples analyzed. Bis(2-ethylhexyl)phthalate was the SVOC detected at the highest concentration (i.e., 3,400 $\mu\text{g}/\text{Kg}$) in any single sample, followed by 2-methylnaphthalene (750 $\mu\text{g}/\text{Kg}$) and di-n-butylphthalate (390 $\mu\text{g}/\text{Kg}$). Chrysene had the highest concentration (i.e., 110 $\mu\text{g}/\text{Kg}$) measured for any cPAH compound detected in soil samples at this site. None of the SVOCs detected in soil samples exhibited sample concentrations in excess of any of NYSDEC's Unrestricted Use criteria levels. Comparably, none of the 95th UCL values computed for any of the SVOCs were observed to exceed their respective NYSDEC Unrestricted Use criteria

values. The 95th UCL values computed for benzo(a)pyrene (112 µg/Kg) and dibenz(a,h)anthracene (118 µg/Kg) exceeded their adjusted Region IX PRG criteria values (62 µg/Kg, each). Benzo(a)pyrene was detected in a total of 20 of the 119 samples collected from SEAD 57 at a maximum concentration of 76 “J” µg/Kg, and only two of the concentrations detected exceeded the adjusted Region IX PRG value (62 µg/Kg). Dibenz(a,h)anthracene was detected in seven of the 119 samples collected at SEAD 57 at a maximum concentration of 24 “J” µg/Kg, which is below its adjusted Region IX PRG criteria value (62 µg/Kg).

One PCB (i.e., aroclor-1260) and 13 organochlorine pesticides were detected the soil samples collected from SEAD 57. Aroclor-1260 was only found in two samples, and in both cases the concentration measured was below NYSDEC’s Unrestricted Use criteria level. The pesticide 4,4’-DDE was detected most frequently in soil samples characterized (9 times), followed by 4,4’DDD (8 times), dieldrin and alpha-chlordane (7 times, each) and 4,4’-DDT (6 times). All of the other pesticides were only found in one or two samples. The 95th UCL concentrations determined for two pesticides, 4,4’-DDD and 4,4’-DDE were the only ones that were observed to exceed NYSDEC’s Unrestricted Use criteria values and in both cases the level of the observed difference were marginal (i.e., 3.32 versus 3.3 µg/Kg for 4,4’-DDE and 3.5 versus 3.3 µg/Kg for 4,4’-DDD). Three of the samples found to contain these pesticides were located in the berm structure at SEAD 57, while an additional three that contained 4,4’-DDE at levels above the unrestricted use levels were found around the former ammunition disassembly plant. None of the detected organochlorine pesticides or PCBs were detected at concentrations that surpassed their respective Region IX PRG levels for residential soils.

Twenty-three metals were detected in the soil samples collected from SEAD 57. Thirteen of the metals (i.e., Al, Ba, Be, Ca, Cr, Co, Fe, Pb, Mg, Mn, Ni, K, and V) were detected in every sample analyzed, while another three metals (i.e., As, Cu, and Zn) were found in more than 90% of the 118 samples characterized. Antimony, calcium, silver and sodium were detected in fewer than 50% of the samples collected. Five of the metals (i.e., Cd, Cu, Pb, Mn, and Zn) were found at concentrations that exceeded NYSDEC/SEDA criteria levels one or more times. Zinc was the metal found at concentrations above its NYSDEC/SEDA criteria value most frequently (7 times). Only two of the samples (TP57-2 at 3 ft bgs, 1250 mg/Kg; and SD57-16 at 0 to 2 inches, 487 mg/Kg) were found to contain concentrations at levels that exceeded the SEDA maximum background concentration (126 mg/Kg) by more than a factor of 3. However, zinc’s 95th UCL concentration was approximately 108 mg/Kg, which is below its NYSDEC/SEDA criteria value of 126 mg/Kg.

Cadmium was found in three samples at concentrations that exceeded its NYSDEC/SEDA criteria value (i.e., 2.9 mg/Kg). Two of these samples showed concentrations that were more than 2 times the background concentration and these were collocated in a sample and sample duplicate pair that were collected from ditch soil location SD57-11. This location is approximately 300 feet northwest of the berm structure. The 95th UCL concentrations computed for cadmium at SEAD 57 was 2.43 mg/Kg which is less than its NYSDEC/SEDA (2.9 mg/Kg) and adjusted Region IX PRG (3.7 mg/Kg) criteria values.

With reference to the other metals that were observed at concentrations above the Unrestricted Use criteria values, only three (i.e., Cu, Pb, and Mn) were found at levels higher than SEDA-background concentrations one time each. Of these metals, only copper and lead showed values that were more than 10 percent higher than the range of concentration observed in SEDA background soils. Both of these high concentrations were found in a soil sample that was collected from TP57-2, which was excavated 3 feet into the berm at SEAD 57.

Based on its review and analysis of the available soil data, it is the Army's position that the soil at SEAD 57 has not been adversely impacted by historic operations and activities performed at this site. The Army believes that the analytical results developed from the soil samples collected demonstrates that the soil remaining at the site is consistent with the clean-up goals established prior to the beginning of the work at SEAD 57. Therefore, no further action is needed.

7.0 CONCLUSIONS

Between May 2006 and November 2006, Parsons performed a munitions removal and CERCLA closure project at four AOCs at the Seneca Army Depot in Seneca County, New York. In general, the results of the project performed at Seneca Army Depot for SEAD 46, SEAD 57, SEAD 007-R-01, SEAD 002-R-01, EOD Disassembly areas and SEAD 57 buffer area indicate that all detected MPPEH has been cleared from these sites. A total of two of the 11,742 identified anomalies which were investigated were found to be MEC. The only two items found were associated with the buffer area north of SEAD 57. The Army believes that no additional munitions response activities and No Further Action are required at these sites. The conclusions from each individual site are provided below.

7.1 SEAD 007-R-01 (Grenade Range)

During the anomaly investigation and surface sweep of the Grenade Range, a total of 218 potential MPPEH items were found. All MPPEH items found were related to the M73 Practice LAW Rocket. The 40mm practice grenade found at this site has an inertia driven expelling system with no explosive material, and therefore cannot be classified as MPPEH. Of the 218 M73 Sub-caliber rounds found, none were found to have the rocket motor intact. All had been functioned previously. Based on these reasons, all of the detected MPPEH items were reclassified as MD. However, due to the potential presence of a small bursting charge in the M73 rounds that emits smoke at time of detonation, all 218 of these rounds were brought to the demolition area and disposed of by detonation as part of the inerting process to allow these to be disposed of as scrap. SEAD 007-R-01 is considered cleared of MPPEH. This investigation was also expanded to include the surface sweep and 25% geophysical survey of the EOD disassembly areas on the Grenade Range road. During this investigation, the 11 areas on the Grenade Range road had 25% of the area investigated with the EM61MK2 towed array. From this investigation 352 targets were identified as anomalies to be investigated by the dig teams. Throughout this investigation, six MPPEH items were recovered (**Table 3-2**) two 37mm, three 57mm target practice projectiles that contain a tracer and the fuse of a 2.35-inch rocket without the base. All of these items were classified as MD upon venting the items to reveal that they were solid projectiles with no filler.

Based on its review and analysis of the available soil data, it is the Army's position that the soil at SEAD 007-R-001 (Grenade Range) has not been impacted by historic operations and activities performed at this AOC. The Army believes that the analytical results developed from the soil samples collected demonstrate that the soil remaining at the AOC is consistent with the clean-up goals established prior to the beginning of the work at SEAD 007-R-001. Therefore, the Army does not believe that further action is needed at this AOC.

7.2 SEAD 002-R-01, EOD Areas 2 and 3

7.2.1 EOD Area 2

Two suspected MPPEH items were found at EOD Area 2 and were later determined to be Munitions Debris based on the final determination by the SUXOS after venting of the items. The two items

found were an electric squibb that was determined to be expended previously and the body of an M16 APERS. The M16 APERS was found by the survey team conducting a boundary survey of the pond low water mark. This item was found without a fuse but due to the mud and debris that filled the case, the item was vented to dispose of any explosive residue that may have remained.

Based on its review and analysis of the available soil data, it is the Army's position that the soil at EOD Area 2 has not been impacted by historic operations and activities performed at this AOC. The Army believes that the analytical results developed from the soil samples collected demonstrates that the soil remaining within this portion of the overall AOC is consistent with the clean-up goals established prior to the beginning of the work at SEAD 002-R-01. Therefore, the Army does not believe that further action is needed at this location

7.2.2 EOD Area 3

No MPPEH items were found during the geophysical anomaly investigation or the expanded handheld investigation of the unmapped area. SEAD 002-R-01 is considered cleared of MPPEH.

Based on its review and analysis of the available soil data, it is the Army's position that the soil at SEAD 002-R-01, EOD Area #3 has not been impacted by historic operations and activities performed at this AOC. Therefore, no further action is needed.

7.3 SEAD 46 (Former 3.5-inch Rocket Range)

During the investigation of SEAD 46, 2054 anomalies were investigated. No MEC items were found and 16 suspected MPPEH items were found. All 16 suspected items were found to be MD after they were vented. The locations of the MD items suggest that the SEAD 46 berm was not used as a target for anything other than small arms practice. All of the MD items are actually found in areas located away from the berm, mostly to the south. Based on the discovery of inert landmines and a sign that identifies the area as a practice minefield for EOD and military training exercises, this was most likely the use of the site. There were no identifiable pieces or complete 3.5-inch rockets found during any of the three previous investigations. Based on the results of this investigation and the past investigations, SEAD 46 is considered cleared of MPPEH.

Based on its review and analysis of the available soil data, it is the Army's position that the soil at SEAD 46 has not been impacted by historic operations and activities performed at this AOC. The Army believes that the analytical results developed from the soil samples collected demonstrates that the soil remaining at the AOC is consistent with the clean-up goals established prior to the beginning of the work at SEAD 46. Therefore, no further action is needed

7.4 SEAD 57 (Former EOD Range)

The only MEC items encountered during this project were found in the SEAD 57 buffer area north of SEAD 57 including one fused unfired 37mm projectile in Grid 57 K-16 and a MKII grenade located in 57K-18 as shown on Figure 3-4c. Figure 3-4c identifies all ferrous and aluminum MD items that were recovered as part of the SEAD 57 investigation. In this figure, the ferrous MD items are concentrated to the north of Building T011. The pattern of the aluminum MD clearly radiates out

from the center of the SEAD 57 berm in a circular pattern that begins to taper off after 250 feet. This figure supports the contention that the two ferrous MEC items found north of Building T011 in the SEAD 57 buffer area were generated due to other activities performed in the area and not a result of activities that took place at SEAD 57.

Out of the 7,485 anomalies investigated at SEAD 57 (woods transects, buffer area and SEAD 57) 47 MPPEH items (listed on Table 3-2) were found at SEAD 57. Of the 47 items found during this investigation, all but the two from the buffer area were determined to be MD upon venting of the items during the disposal process. SEAD 57 is considered cleared of MPPEH and No Further Action is required.

Based on its review and analysis of the available soil data, it is the Army's position that the soil at SEAD 57 has not been adversely impacted by historic operations and activities performed at this AOC. The Army believes that the analytical results developed from the soil samples collected demonstrates that the soil remaining at the AOC is consistent with the clean-up goals established prior to the beginning of the work at SEAD 57. Therefore, no further action is needed.

Volatile Organic Compounds

1,1,1-Trichloroethane	Cis-1,3-Dichloropropene
1,1,2,2-Tetrachloroethane	Cyclohexane
1,1,2-Trichloro-1,2,2-Trifluoroethane	Dichlorodifluoromethane
1,1,2-Trichloroethane	Ethyl benzene
1,1-Dichloroethane	Isopropylbenzene
1,1-Dichloroethene	Meta/Para Xylene
1,2,4-Trichlorobenzene	Methyl Acetate
1,2-Dibromo-3-chloropropane	Methyl Tertbutyl Ether
1,2-Dibromoethane	Methyl bromide
1,2-Dichlorobenzene	Methyl butyl ketone
1,2-Dichloroethane	Methyl chloride
1,2-Dichloropropane	Methyl cyclohexane
1,3-Dichlorobenzene	Methyl ethyl ketone
1,4-Dichlorobenzene	Methyl isobutyl ketone
Acetone	Methylene chloride
Benzene	Ortho Xylene
Bromodichloromethane	Styrene
Bromoform	Tetrachloroethene
Carbon disulfide	Toluene
Carbon tetrachloride	Trans-1,2-Dichloroethene
Chlorobenzene	Trans-1,3-Dichloropropene
Chlorodibromomethane	Trichloroethene
Chloroethane	Trichlorofluoromethane
Chloroform	Vinyl chloride
Cis-1,2-Dichloroethene	

**Table 6-1
Analytes in Soil Samples - Munitions Response**

**Munitions Response and CERCLA Closure
Seneca Army Depot Activity**

Semivolatile Organic Compounds

1,1'-Biphenyl	Benzo(ghi)perylene
2,4,5-Trichlorophenol	Benzo(k)fluoranthene
2,4,6-Trichlorophenol	Bis(2-Chloroethoxy)methane
2,4-Dichlorophenol	Bis(2-Chloroethyl)ether
2,4-Dimethylphenol	Bis(2-Chloroisopropyl)ether
2,4-Dinitrophenol	Bis(2-Ethylhexyl)phthalate
2,4-Dinitrotoluene	Butylbenzylphthalate
2,6-Dinitrotoluene	Caprolactam
2-Chloronaphthalene	Carbazole
2-Chlorophenol	Chrysene
2-Methylnaphthalene	Di-n-butylphthalate
2-Methylphenol	Di-n-octylphthalate
2-Nitroaniline	Dibenz(a,h)anthracene
2-Nitrophenol	Dibenzofuran
3,3'-Dichlorobenzidine	Diethyl phthalate
3-Nitroaniline	Dimethylphthalate
4,6-Dinitro-2-methylphenol	Fluoranthene
4-Bromophenyl phenyl ether	Fluorene
4-Chloro-3-methylphenol	Hexachlorobenzene
4-Chloroaniline	Hexachlorobutadiene
4-Chlorophenyl phenyl ether	Hexachlorocyclopentadiene
4-Methylphenol	Hexachloroethane
4-Nitroaniline	Indeno(1,2,3-cd)pyrene
4-Nitrophenol	Isophorone
Acenaphthene	N-Nitrosodiphenylamine
Acenaphthylene	N-Nitrosodipropylamine
Acetophenone	Naphthalene
Anthracene	Nitrobenzene
Atrazine	Pentachlorophenol
Benzaldehyde	Phenanthrene
Benzo(a)anthracene	Phenol
Benzo(a)pyrene	Pyrene
Benzo(b)fluoranthene	

Explosives

1,3,5-Trinitrobenzene	4-Nitrotoluene
1,3-Dinitrobenzene	4-amino-2,6-Dinitrotoluene
2,4,6-Trinitrotoluene	HMX
2,4-Dinitrotoluene	Nitrobenzene
2,6-Dinitrotoluene	Nitroglycerine
2-Nitrotoluene	Pentaerythritol Tetranitrate
2-amino-4,6-Dinitrotoluene	RDX
3-Nitrotoluene	Tetryl

Table 6-1
Analytes in Soil Samples - Munitions Response

Munitions Response and CERCLA Closure
Seneca Army Depot Activity

PCBs

Aroclor-1016	Aroclor-1248
Aroclor-1221	Aroclor-1254
Aroclor-1232	Aroclor-1260
Aroclor-1242	

Pesticides

4,4'-DDD	Endosulfan sulfate
4,4'-DDE	Endrin
4,4'-DDT	Endrin aldehyde
Aldrin	Endrin ketone
Alpha-BHC	Gamma-BHC/Lindane
Alpha-Chlordane	Gamma-Chlordane
Beta-BHC	Heptachlor
Delta-BHC	Heptachlor epoxide
Dieldrin	Methoxychlor
Endosulfan I	Toxaphene
Endosulfan II	

Metals

Aluminum	Magnesium
Antimony	Manganese
Arsenic	Mercury
Barium	Nickel
Beryllium	Potassium
Cadmium	Selenium
Calcium	Silver
Chromium	Sodium
Cobalt	Thallium
Copper	Vanadium
Iron	Zinc
Lead	

Other Analyses

Nitrate Nitrogen	Percent Solids

Volatile Organic Compounds

1,1,1-Trichloroethane	Chloroform
1,1,2,2-Tetrachloroethane	Cis-1,3-Dichloropropene
1,1,2-Trichloroethane	Ethyl benzene
1,1-Dichloroethane	Methyl bromide
1,1-Dichloroethene	Methyl butyl ketone
1,2-Dichloroethane	Methyl chloride
1,2-Dichloroethene (total)	Methyl ethyl ketone
1,2-Dichloropropane	Methyl isobutyl ketone
Acetone	Methylene chloride
Benzene	Styrene
Bromodichloromethane	Tetrachloroethene
Bromoform	Toluene
Carbon disulfide	Total Xylenes
Carbon tetrachloride	Trans-1,3-Dichloropropene
Chlorobenzene	Trichloroethene
Chlorodibromomethane	Vinyl chloride
Chloroethane

Nitrate Nitrogen	MG/KG	24	42	10.6	6.86	NA	--	--	NA	
Percent Solids	%	42	42	79.3		NA	--	--	NA	

Notes:

(1) NYSDEC's Unrestricted Use Soil Cleanup Objective, 6 NYCRR Part 375-6.8(a) or maximum SEDA-specific background concentration. SEDA-specific values identified in bolded text.

(2) Adjusted USEPA Region IXs Residential Soil PRG or maximum SEDA-specific background concentration.

Presence of an asterik (*) next to a value indicates that it is a SEDA-specific background concentration.

If Region IX value is used, carcinogenic compounds set at 1 X EPA value, non-carcinogenic compounds set at 0.1 X EPA value.

(3) Highlighted cells indicate that the Maximum or 95th UCL concentration value(s) are greater than the comparative value.

Sample/Duplicate pairs are evaluated as separate and discrete samples in this table.

NA = Not Available or Not Applicable.

Notes:

(1) NYSDEC's Unrestricted Use Soil Cleanup Objective, 6 NYCRR Part 375-6.8(a) or maximum SEDA-specific background concentration. SEDA-specific values identified in bolded text.

(2) Adjusted USEPA Region IXs Residential Soil PRG or maximum SEDA-specific background concentration.

Presence of an asterik (*) next to a value indicates that it is a SEDA-specific background concentration.

If Region IX value is used, carcinogenic compounds set at 1 X EPA value, non-carcinogenic compounds set at 0.1 X EPA value.

(3) NYSDEC's Division of Environmental Remediations's Benzo(a)pyrene Toxicity Equivalents guidance value.

(4) Highlighted cells indicate that the Maximum or 95th UCL concentration value(s) are greater than the comparative value.

Sample/Duplicate pairs are evaluated as separate and discrete samples in this table.

NA = Not Available or Not Applicable

**Table 6-9
SEAD 57 Soil Sample Summary Results**

**Munitions Response and CERCLA Closure
Seneca Army Depot Activity**

Parameter	Units	Number of Times Detected	Number of Samples Analyzed	Maximum Concentration	95th UCL Concentration	NYSDEC Unrestricted Value (1)	Number Above Unrestricted Value	95th UCL Above Unrestricted Value	USEPA Region IX Residential PRG Value (3)	95th UCL Above Residential PRG Value
Other Analytes										
Cation exchange capacity	meq/110g	32	32	31.4		NA	--	--	NA	--
Nitrate/Nitrite Nitrogen	MG/KG	99	100	4.4	0.61	NA	--	--	NA	--
Percent Solids	% WW	101	100	94		NA	--	--	NA	--
Soil pH (std. units)		33	33	7.83		NA	--	--	NA	--

Notes:

(1) NYSDEC's Unrestricted Use Soil Cleanup Objective, 6 NYCRR Part 375-6.8(a) or maximum SEDA-specific background concentration. SEDA-specific values identified in bolded text.

(2) Adjusted USEPA Region IXs Residential Soil PRG or maximum SEDA-specific background concentration.

Presence of an asterik (*) next to a value indicates that it is a SEDA-specific background concentration.

If Region IX value is used, carcinogenic compounds set at 1 X EPA value, non-carcinogenic compounds set at 0.1 X EPA value.

(3) Highlighted cells indicate that the Maximum or 95th UCL concentration value(s) are greater than the comparative value.

Sample/Duplicate pairs are evaluated as separate and discrete samples in this table.

NA = Not Available or Not Applicable.

SECTION 1 INTRODUCTION

1.1 In accordance with the work plan for the Munitions Response and CERCLA Closure project section 3.3, Parsons was required to demonstrate the ability to use the proposed geophysical equipment for the detection of buried ordnance items. A prove-out was required to demonstrate the ability of the personnel and equipment to detect buried stimulant items in similar conditions to be expected in the survey area. As stated in the work plan section 3 a geophysical proveout was required at the beginning of the project and every time new geophysical equipment was introduced to the site. During the course of this project two sets of EM61MK2 coils and one G858 magnetometer were used to collect geophysical data. Subsequently the proveout procedure was performed three times throughout the duration of this project. The first proveout was conducted on the afternoon of May 06, 2006 by a crew of two persons from Parsons. The Second was performed September 9, 2006 and the third time the proveout was performed with the G858 magnetometer on July 21, 2006. The proveout was conducted all three times over the Q (East) area proveout grid. The Q area proveout grid had been used previously by Parsons as part of the OE EE/CA conducted at the site in 2000. The grid contained several items that were buried by Parsons under supervision of USACOE at known locations and additional blind items buried by the COE, Table 1.1 lists the items that were buried during the setup of the proveout in 2000:

1.2 This report is broken into eight sections:

- Section 2 States the objectives that were set forth for the prove-out.
- Section 3 Presents the equipment used for the prove-out test.
- Section 4 Describes how the equipment was used during the prove-out.
- Section 5 Discusses the data processing performed on the data generated from the prove-out.
- Section 6 Presents the results of the geophysical data analyses.
- Section 7 Presents the Quality Control (QC) procedures performed during the prove-out.
- Section 8 Evaluation of geophysical data collection

V= Vertical

SECTION 2 OBJECTIVES

2.0 The primary objective of the geophysical prove-out was to achieve the following:

1. Demonstrate the capability and effectiveness of the Parsons EM6MK2 towed array and Geonics G858 magnetometer to locate buried simulated MEC items under anticipated conditions at the site.
2. Verify conformance of the geophysical instruments with MR-005-05A (Geophysical Prove-Out Plan) in regards to the anomaly depth detection criteria.
3. Verify the ability of parsons to collect accurate and precise geophysical data.

SECTION 3

GEOPHYSICAL SURVEY EQUIPMENT

3.1 GEOPHYSICAL INSTRUMENTS

3.1.1 Three Geonics™ EM61MKII systems were attached together using dimensional lumber with fiberglass connectors and wooden wheels. The goals in the construction of the array were the following:

- Rigid construction to reduce the motion of the coils relative to each other thereby reducing noise.
- Use material that is as strong as possible while still providing the quiet platform that is required for the collection of geophysical data.
- Use a design that is easily tow able by an off road vehicle (pickup truck or John Deer Gator), while maintaining enough distance from the tow vehicle to minimize any electronic noise from the vehicle.

3.1.2 The array was designed with a coil spacing of three feet. However, the ability to change the spacing to 2.5 feet was developed in case the system was unable to detect all the previously detected items in the “Q” area proveout grid.

3.1.3 The EM-61MK2 device generates an electromagnetic pulse that triggers eddy currents in the subsurface. The eddy current decay rate produces a secondary magnetic field that is monitored by a receiving coil. These secondary magnetic fields are received as data and stored in a data logger until it can be downloaded to a personal computer (PC) for interpretation. The EM-61MK2 coil system receives the signal in receiving coils at two separate heights above the ground surface. The upper and lower coils are separated by a height of forty centimeters giving separate measurements. For this prove out only the bottom coil was used to reduce the weight of the towed array system. The EM-61MK2 data logger collects data at automatic time intervals determined by the user (up to about twelve times per second) or at a pre-programmed distance interval measured by an attached set of wheels with all terrain tires.

3.1.3 The EM-61MK2 uses a 05.x1.0 m coils and records data from either the top coil and three different time gates from the bottom coil or four different time gates from the bottom coil. The latter mode was used for the proveout. The data stream for each sensor was streamed to the logging software over serial cables. The use of the logging software described below allows the logging of the data at rates up to 16 Hz. For this proveout, the data was logged at a rate of 12 Hz.

3.1.4 Geometrics™ G858 Magnetometer the G-858 uses two cesium vapor magnetometer sensors that are comprised of a miniature atomic absorption unit from which a signal proportional to the intensity of the ambient magnetic field is derived. The sensitivity of the instrument is 0.05nT (nano Tesla) and can be read as fast as ten times per second (10 Hertz) depending on required sensitivity. The device was operated as a gradiometer with two sensors collecting magnetic field intensity data separated by a vertical distance of approximately 1.5 feet. The difference between the two sensor readings (divided by the sensor separation) was recorded as the magnetic gradient at the measured location.

3.2 GLOBAL POSITIONING SYSTEM EQUIPMENT

3.2.1 A Trimble 5700 RTK DGPS (differential GPS) was used to position the array. A GPS antenna was placed on a tripod above the center coil and connected to the electronics located in the back of the tow vehicle. The Trimble 5700 RTK DGPS system is an integrated parallel channel GPS receiver with a built-in radio-modem communication system. A dedicated base station broadcasts real-time differential corrections to the rover units being used by the field crew. Positional data in the GGK format was output to the logging computer at 1 s. interval using a serial cable.

3.3 LOGGING SYSTEM

3.3.1 The logging system used was Geometrics Maglog™ software running on a laptop computer held by the operator. The laptop was equipped with an adaptor to provide four serial ports to log the data from the three EM-61MK2s and the RTK GPS system. The logging software provides several functions. They include:

- Streaming of raw data to hard disk. This is the first task of the software and takes priority over everything else.
- Display of results in graphical format so that the operator can have a real time analysis of the equipment functioning.

3.3.2 The logging software puts a time stamp from the computer on each data reading from every sensor. The time stamp is derived from the computer clock and so it is independent of the clocks on the EM-61MK2 and GPS electronics. This removes the requirement for synchronization of EM-61MK2 and GPS clocks and removes any effects of drift on the EM-61MK2 clocks.

3.3.3 The G858 data is stored directly in the internal memory of the instrument controller and is time stamped as it is collected in the field. This data is then downloaded directly to the processing computer at the end of the day using a RS 232 data cable to transfer the data to the computer. The data is

downloaded as station files (.stn) these files are the recorded response, the time and the X, Y location of the recorded values.

3.4 TOW VEHICLE FOR EM61MK2

The tow vehicle employed for this survey was a Ford F350 truck that is interchangeable with a John Deer Gator both vehicles have a similar noise threshold of less than 10mV

This vehicle provides:

- adequate space for all the required electronics,
- two seats so that a driver and an operator can both be in the vehicle,
- selection between 2 or 4 wheel drive,
- Electromagnetically quiet operation.

SECTION 4

GEOPHYSICAL SURVEY PROCEDURES

4.1 DATA ACQUISITION EM61MK2

4.1.1 The data was collected by towing the array of three EM61MK2 back and forth across the proveout grid until complete coverage had been obtained. During this time, the operator is solely responsible for monitoring the displays on the laptop; no other input is required from the operator once data logging has started.

4.1.2 The logging software provides a real time display of the position of the GPS antenna located above the array; however, this is difficult to navigate with because of the distance between the antenna and the tow vehicle. For this survey the tire marks of the tow vehicle and the wheel marks of the towed array platform were used as markers for the next line. The driver uses the marks on the ground from the previous line to navigate the vehicle to ensure that full coverage is obtained over the entire survey grid. The lines were spaced approximately 9 feet apart, approximately the width of the entire array.

4.1.3 At the start and end of the surveying a static test was conducted to verify the operation of the instruments. Data was recorded from the array while it was stationary. Subsequently a 2" trailer ball was placed under a coil in the array and additional data recorded. The ball was then moved to a location under the next coil and data recorded again. This was done for all three coils. This verifies that the instruments are responding to a test item, and ensures that the sensors are connected to the correct serial ports on the computer so that they can be positioned correctly.

4.1.4 Before and after data acquisition on each grid, the array was run back and forth over the latency test setup of three trailer balls all placed at know notations and surveyed in using the DGPS system. This provides a measurement of the instrument latency. The latency can then be determined by finding a correction value that result in exactly overlapping peaks over the item when the instrument is run from different directions.

4.2 DATA ACQUISITION G858

Data acquisition with the G858 magnetometer is quite different than the EM-61Mk2 towed array. The survey instrument is hand carried from one end of the prove-out grid to the other rather than towed by a vehicle. Also the data is collected on 2.5 foot lanes rather than the three foot lanes the Em61MK2 data is collected on. For this survey the instrument was set up with a 24 inch distance between sensors and a bottom sensor height of 18 inches off the ground. This setup has proven effective on previous surveys of the proveout grid and has been determined to give the best resolution and survey

efficiency for the conditions. As the operator walks the instrument from south to north data is collected at a constant rate of 10 hertz. This data is logged at a constant rate to later be correlated to the speed of the operator and the distance from the start point an anomaly is detected. When the operator reaches the half way point of the survey a fiducial button is pushed to mark in the data the location of the instrument within the data. This allows the data processor to break the line of data into sections and more accurately extrapolate the position of the sensor within the data line. When the operator reaches the northern end of the grid the data collection is stopped and the survey instrument is moved to the east 2.5 feet and the procedure is repeated with the operator walking south. This is procedure is repeated until the entire grid has been covered by the operator.

SECTION 5

DATA DOWNLOADING AND PROCESSING

5.1 DATA DOWNLOADING

5.1.1 Maglog creates a separate data file for each sensor (3 EM-61MK2 files and 1 GPS file), plus additional files that provide information on the individual lines within the data file as well as on the instruments that were used to collect each file. These files were transferred from the field laptop computer to the processing computer using a flash memory card.

5.1.2 The G858 data is transferred directly from the internal data logger to the field laptop where corrections in heading and line numbering can be made using the Magmap2000™ program. Once the data has been corrected for position and distance than Magmap2000™ program can export the data in the .XYZ format that is acceptable to Geosoft™.

5.2 DATA PROCESSING

5.2.1 Three data sets were collected during the field effort for this prove-out. All of the data from both the Em and Magnetics surveys were imported into Geometrics *Magmapper2000*™ software for pre-processing. Magmapper reads in all the data and displays the track of the GPS antenna and profile plots of the selected channels from the EM-61MK2 sensors. The offsets to the center of each coil from the GPS antenna are entered into Magmapper and then the data is exported into Geosoft XYZ format. Three XYZ files are created by Magmapper, one for each sensor in the array. Each XYZ file contains the data for each channel recorded by the respective sensor, as well as the position of the sensor based on the location of the GPS antenna and the offsets entered for that unit. The data processor uses Magmapper to correct the direction and heading of the lines of data collected with the magnetometer. Once the correct direction and heading for each line is confirmed the processor can assign the northing and easting locations of the start and end position of the line and the program will convert the station file into the northing and easting format. The program will then output the .XYZ file that has the instrument response and the corrected northing and easting locations of the instrument.

5.2.2 All data sets were processed using Geosoft's *Oasis Montage*™ software. Individual Geosoft databases were created for each proveout grid surveyed.

5.2.3 The EM-61MK2MK2 data were processed with the following procedures:

- Conversion from WG84 latitude and longitude to NAD 83 New York Central state plane coordinates.

- Latency correction using the values derived from the lag bar tests conducted before and after each survey. Typically a .35 s. latency correction was used.
- Drift Correction by subtraction of the median value from each data point in the four time gate channels. The median was calculated using a 150 point rolling statistics filter. The four leveled time gate channels were added together to produce a total channel (ch1+ch2+ch3+ch4= total channel)
- Gridding using .5 grid node spacing and a blanking distance of 2-ft.

5.3.3 The Geometrics G858 data was processed with the following procedures:

- Conversion from WG84 latitude and longitude to NAD 83 New York Central state plane coordinates.
- Latency correction using the values derived from the lag tests conducted before and after each survey. Typically a .35 s. latency correction was used.
- Gridding using .5 grid node spacing and a blanking distance of 2-ft.

SECTION 6 RESULTS

6.1 DATA RESULTS

6.1.1 The geophysical data for the surveyed grids for each proveout area are displayed on a map. Maps with the grids displayed are shown in Figures 6.1 through 6.3 in Appendix A for the East grids respectively. The known locations for the items buried in the East proveout grid are also shown in Table 1-1. The original locations, determined during the January, 2000 OE EE/CA Geophysical Proveout (Report on Geophysical Equipment Test Prove-Out, Parsons, June, 2000), were obtained by pulling tapes from corner locations surveyed in using a Trimble ProXRS with sub-meter accuracy. The locations plotted on Figure 6.1, 6.2 and 6.3 were calculated using the more accurate corner locations. Because the original corner distances for the COE buried items were not available, an approximate shift in position was obtained using the difference between the original and improved corner locations. For this reason this geophysical prove out will focus on the Parsons buried items that have known locations however the COE items will be displayed on the figures to show the items were detected.

SECTION 7 QUALITY CONTROL

7.1 INTRODUCTION

7.1.1 Quality control for the Seneca Army Depot Activity geophysical prove-out data was maintained by performing three types of QC procedures: 1) static tests, 2) instrument latency tests over the latency test area and 3) positional quality checks over known item locations.

7.2 STATIC TESTS

7.2.1 Static tests for the EM-61MK2 towed array were performed by holding the array stationary and recording data with and without a test item under each coil. This resulted in four separate tests conducted before and after surveying operations each day. The test object consisted of a metal 2-inch trailer hitch ball and data were collected for approximately 3 minutes in each instance. The static test at the beginning of the day showed on the order of ± 0.5 mv of noise.

7.2.2 Static tests for the G858 magnetometer were conducted by placing the instrument on a wooden test stand that held the instrument steady and at the at the correct height and recording data with and without a test item under each sensor. The test object consisted of a metal 2-inch trailer hitch ball and data were collected for approximately 3 minutes in each instance. The static test at the beginning of the day showed on the order of ± 1 nT of noise.

7.3 INSTRUMENT LATENCY CHECK

7.3.1 A latency test was conducted before and after data acquisition on each grid. The test was conducted by acquiring data while traveling at right angles over the three items previously established latency correction area. An instrument latency correction was applied using the DOD QA/QC module in Oasis Montaj. Use of the correct latency correction results in overlapping peaks when traveling in opposite directions.

7.3.2 A latency test was performed with the G858 magnetometer by placing the test item at the fiducial line on line 0 of the survey area. The line than had two lines of data collected over the area both north and south on this line. When the data was processed the difference between the instrument reading and the marked fiducial line would be equal to the latency correction for the data processing.

7.4 POSITIONAL CHECK

7.4.1 A positional check was conducted by comparing the locations of the anomalies picked in the East proveout grid data with the known locations of the OE simulants buried in the grid. This analysis showed positional errors of approximately 1.1 to 1.2 ft, which is expected based on the width of the EM-61MK2MKII coil and the sensor coverage of the G858 sensor.

SECTION 8 CONCLUSIONS

8.1 Buried simulated UXO items were detected using the EM-61MK2 towed array and G85 magnetometer conducted by Parsons at the east proveout grid located in the Q area at the Seneca Army Depot.

8.2 The results of this study show that the both instruments were capable of acquiring data with a low background noise level and high positional accuracy in accordance with MR-005-05A.

8.3 Based on these results The current configuration of the three EM 61MK2's used in the proveout of the east proveout grid on May 6 and September 9 are capable of detecting buried stimulant items consistent with the conditions expected at Seneca Army Depot. The current configuration of the G858 Magnetometer operated in vertical gradient mode is capable of detecting buried stimulant items consistent with the conditions and density expected at Seneca Army Depot.

8.4 There were some small differences between the instruments and the items they were able to detect. The magnetometer missed the three slap flares (PAR8, PAR15 and PAR24), and a 3.5-inch warhead (PAR7) that were detected in the May and September surveys with the EM-61MK2. The EM-61MK2 survey in May missed the same 3.5-inch warhead at 45 inches that was missed by the magnetometer. The September EM-61MK2 survey detected the 3.5-inch rocket warhead (PAR23) at 45 inches but did not detect the mechanical flare at 23 inches (PAR7). Both of these items were detected just above the background noise threshold of 10mV for the towed array survey. These results are identical to the results of the baseline geophysical survey of the prove-out grid in the 2000 OE EE/CA (Report on Geophysical Equipment Test Prove-Out, Parsons, June, 2000) where the EM61 was not able to detect the mechanical fuse (PAR7) or the 3.5-inch warhead (PAR23) and the magnetometer was not able to detect the 3.5-inch warhead or the flare simulants. The three flare simulants in the magnetometer survey were constructed out of non-ferrous aluminum, a metal that is virtually undetectable to the instrument due to the lack of a strong magnetic field needed for the 858 to detect items.

8.5 Both instruments were able to detect the buried OE simulants on the Parsons side of the grid to and beyond the depths specified in USAESCH Data Item Description (DID) MR-005-05A, which defines geophysical investigation performance goals. The one item missed by both instruments, a 3.5" rocket warhead was buried below the detection limit for both of the instruments, as was the fuze missed by the EM-61.

Notes:

1) DGM survey coordinates were obtained from Shaw E & I Inc SEAD-46/57 Completion Report. GPS survey coordinates were produced by Parsons.

2) QC Code (-) indicates the Anomaly was not QC'ed, (Pass) indicates the Anomaly was QC'ed and was acceptable.

APPENDIX C
SEAD 57 All Dig Results
Explosives Safety Submission Completion Report
Seneca Army Depot Activity

Worksite	Anomaly ID	DGM ¹ and GPS SURVEY			REACQUISITION		Depth (in)	Location Offset (in)	Type	Date	DIG RESULTS		QPOST-DIG QC	
		Location (ft) Easting (X) Northing (Y)	Amp ²	Amp Unit	Date	Amp					Item	Description	QC Code ³	QC Initials

Notes:

- 1) DGM survey coordinates were obtained from Shaw E & I Inc SEAD-46/57 Completion Report. GPS survey coordinates were produced by Parsons.
- 2) EM-61 Response (mV) and 858 Magnetomer (nT) readings are listed in the Amp column in DGM and GPS Survey category.
- 3) QC Code (-) indicates the Anomaly was not QC'ed, (Pass) indicates the Anomaly was QC'ed and was acceptable.

(1) Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process

(1) Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process
