#### NOTES

- 1) Sample-duplicate pairs were averaged and the average results was used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Residential Soil (October 2004)
- 3) The criteria value source is NYSDEC Technical and Administrative Guidance Memorandum (TAGM) HWR-94-4046, Revised January 24, 1994.
- 4) The maximum detected concentration was obtained from the average of the sample and its duplicate.
- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process
- NJ = compound was "tentatively identified" and the associated numerical value is approximate

#### NOTES

- 1) Sample-duplicate pairs were averaged and the average results was used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Residential Soil (October 2004)
- 3) The criteria value source is NYSDEC Technical and Administrative Guidance Memorandum (TAGM) HWR-94-4046, Revised January 24, 1994.
- 4) The maximum detected concentration was obtained from the average of the sample and its duplicate.
- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process
- NJ = compound was "tentatively identified" and the associated numerical value is approximate

#### NOTES

- 1) Sample-duplicate pairs were averaged and the average results was used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Residential Soil (October 2004)
- 3) The criteria value source is NYSDEC Technical and Administrative Guidance Memorandum (TAGM) HWR-94-4046, Revised January 24, 1994.
- 4) The maximum detected concentration was obtained from the average of the sample and its duplicate.
- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process
- NJ = compound was "tentatively identified" and the associated numerical value is approximate

#### NOTES

- 1) Sample-duplicate pairs were averaged and the average results was used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Residential Soil (October 2004)
- 3) The criteria value source is NYSDEC Technical and Administrative Guidance Memorandum (TAGM) HWR-94-4046, Revised January 24, 1994.
- 4) The maximum detected concentration was obtained from the average of the sample and its duplicate.
- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process
- NJ = compound was "tentatively identified" and the associated numerical value is approximate

#### NOTES

- 1) Sample-duplicate pairs were averaged and the average results was used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Residential Soil (October 2004)
- 3) The criteria value source is NYSDEC Technical and Administrative Guidance Memorandum (TAGM) HWR-94-4046, Revised January 24, 1994.
- 4) The maximum detected concentration was obtained from the average of the sample and its duplicate.
- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process
- NJ = compound was "tentatively identified" and the associated numerical value is approximate

#### NOTES

- 1) Sample-duplicate pairs were averaged and the average results was used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Residential Soil (October 2004)
- 3) The criteria value source is NYSDEC Technical and Administrative Guidance Memorandum (TAGM) HWR-94-4046, Revised January 24, 1994.
- 4) The maximum detected concentration was obtained from the average of the sample and its duplicate.
- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process
- NJ = compound was "tentatively identified" and the associated numerical value is approximate

#### NOTES

- 1) Sample-duplicate pairs were averaged and the average results was used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Residential Soil (October 2004)
- 3) The criteria value source is NYSDEC Technical and Administrative Guidance Memorandum (TAGM) HWR-94-4046, Revised January 24, 1994.
- 4) The maximum detected concentration was obtained from the average of the sample and its duplicate.
- U = compound was not detected
- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process
- NJ = compound was "tentatively identified" and the associated numerical value is approximate

#### NOTES:

- 1) Sample-duplicate pair was averaged and the average results were used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Tap Water (October 2004)
- 3) Action Levels are from the New York State Ambient Water Quality Standards, Class C for Surface Water.
- 4) The maximum detected concentration was obtained from the average of the sample (121I-3007) and its duplicate (121I-3005).

U = compound was not detected

- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process

#### NOTES:

- 1) Sample-duplicate pair was averaged and the average results were used in the summary statistic presented in this table.
- 2) The criteria value source is the Region IX Preliminary Remediation Goals for Tap Water (October 2004)
- 3) Action Levels are from the New York State Ambient Water Quality Standards, Class C for Surface Water.
- 4) The maximum detected concentration was obtained from the average of the sample (121I-3007) and its duplicate (121I-3005).

U = compound was not detected

- J = the reported value is an estimated concentration
- UJ = the compound was not detected; the associated reporting limit is approximate
- R = the data was rejected in the data validating process

#### TABLE E-1A

#### CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C

#### SEAD-121C AND SEAD-121I RI REPORT Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x CF x FI x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Soil, mg/kg IR = Ingestion Rate

CF = Conversion Factor FI = Fraction Ingested

EF = Exposure Frequency ED = Exposure Duration

BW = Bodyweight AT = Averaging Time Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

#### TABLE E-1B

#### CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF SOIL CENTRAL TENDENCY (CT) - SEAD-121C

#### SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x CF x FI x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Soil, mg/kg

EF = Exposure Frequency ED = Exposure Duration BW = Bodyweight IR = Ingestion Rate CF = Conversion Factor FI = Fraction Ingested AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

#### TABLE E-2A

#### CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C

#### SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

EPC x CF x SA x AF x ABS x EV x EF x ED Equation for Intake (mg/kg-day) =

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):  $EV = Event \ Frequency$ EPC = Exposure Point Concentration in Soil, mg/kg CF = Conversion Factor EF = Exposure Frequency SA = Surface Area Contact ED = Exposure Duration AF = Adherence Factor BW = Bodyweight ABS = Absorption Factor AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

N/A= Information not available.

Absorption factor for benzene was assumed to be 0.01 in accordance with the USEPA Region 4 (2000) guidance for VOCs.

Supplemental Guidance to RAGS: Region 4 Bulletins, Human Health Risk Assessment Bulletins (http://www.epa.gov/region4/waste/ots/healtbul.htm).

<sup>\*</sup> Absorption factors from Exhibit 3-4 of USEPA (2004) Supplemental Guidance for Dermal Risk Assessment, Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume I).

Absorption factors for antimony, copper, and iron were assumed to be 0.001 in accordance with the USEPA Region 4 (2000).

#### TABLE E-2B

#### CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO SOIL

#### CENTRAL TENDENCY (CT) - SEAD-121C SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x CF x SA x AF x ABS x EV x EF x ED

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Soil, mg/kg

EV = Event FrequencyEF = Exposure Frequency

ED = Exposure Duration

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

AF = Adherence Factor ABS = Absorption Factor

SA = Surface Area Contact

BW = Bodyweight AT = Averaging Time

Absorption factors for antimony, copper, and iron were assumed to be 0.001 in accordance with the USEPA Region 4 (2000).

Absorption factor for benzene was assumed to be 0.01 in accordance with the USEPA Region 4 (2000) guidance for VOCs.

Supplemental Guidance to RAGS: Region 4 Bulletins, Human Health Risk Assessment Bulletins (http://www.epa.gov/region4/waste/ots/healtbul.htm).

#### TABLE E-3A

## CALCULATION OF INTAKE AND RISK FROM INHALATION OF DUST IN AMBIENT AIR REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C SOIL

#### SEAD-121C AND SEAD-121I RI REPORT

#### Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x EF x ED
BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = EPC in Air, mg/m³

EQUation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

EPC = EPC in Air, mg/m³

EQUation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

EPC = EPC in Air, mg/m³

EPC = EPC in Air, mg/m³

EPC = EPC in Air, mg/m³

EPC = EPC in Air, mg/m³

EQUation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

EPC = EPC in Air, mg/m³

EPC = EPC in Air, mg/m³

EPC = EPC in Air, mg/m³

EPC = EPC in Air, mg/m³

EQUATION FOR EXAMPLE OF THE CARREST OF THE CARR

|  | Inhalation      | Carc. Slope        | Air EPC from         | Air EPC from         |            | Industria      | ıl Worker           |        |            | Constru         | ction Worker        |        |            | Adolescent      | Trespasser          |        |

NA= Information not available.

(2) This EPC was used for the construction worker.

<sup>(1)</sup> This EPC was used for the industrial worker and the adolescent trespasser.

#### TABLE E-3B

#### CALCULATION OF INTAKE AND RISK FROM INHALATION OF DUST IN AMBIENT AIR

#### CENTRAL TENDENCY (CT) - SEAD-121C SOIL SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x EF x ED
BW x AT
Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = EPC in Air, mg/m<sup>3</sup>
ED = Exposure Duration

ED = Exposure Duration
BW = Bodyweight
EF = Exposure Frequency
BW = Bodyweight
AT = Averaging Time

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

This EPC was used for the industrial worker and the adolescent trespasser.

(2) This EPC was used for the construction worker.

#### TABLE E-4A

#### CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF DITCH SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C

#### SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x CF x FI x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom); EPC = Exposure Point Concentration in Ditch Soil, mg/kg EF = Exposure Frequency ED = Exposure Duration IR = Ingestion Rate CF = Conversion Factor BW = Bodyweight FI = Fraction Ingested AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Supplemental Guidance to RAGS: Region 4 Bulletins, Human Health Risk Assessment Bulletins (http://www.epa.gov/region4/waste/ots/healtbul.htm).

<sup>\*</sup> Absorption factors from Exhibit 3-4 of USEPA (2004) Supplemental Guidance for Dermal Risk Assessment, Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume I). Absorption factor for iron was assumed to be 0.001 in accordance with the USEPA Region 4 (2000)

#### TABLE E-5B

## CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO DITCH SOIL CENTRAL TENDENCY (CT) - SEAD-121C

#### SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x CF x SA x AF x ABS x EV x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = Exposure Point Concentration in Ditch Soil, mg/kg

CF = Conversion Factor

SA = Surface Area Contact

AF = Adherence Factor

BW = Bodyweight

ABS = Absorption Factor

AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

(2) This EPC was used for the construction worker.

<sup>(1)</sup> This EPC was used for the industrial worker and the adolescent trespasser.

#### TABLE E-6B

## CALCULATION OF INTAKE AND RISK FROM INHALATION OF DUST IN AMBIENT AIR CENTRAL TENDENCY (CT) - SEAD-121C DITCH SOIL

#### SEAD-121C AND SEAD-121I RI REPORT

#### Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x EF x ED
BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = EPC in Air, mg/m³

ED = Exposure Duration
BW = Bodyweight
EF = Exposure Frequency

ED = Exposure Frequency

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

AT = Averaging Time

NA= Information not available.

Kp value from Exhibit 3-1 of "Supplemental Guidance for Dermal Risk Assessment", Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume 1), August 16, 2004. For arsenic, iron, manganese, thallium, and vanadium the default inorganic value of 0.001 was used. Kp for Cr(VI) was used for chromium.

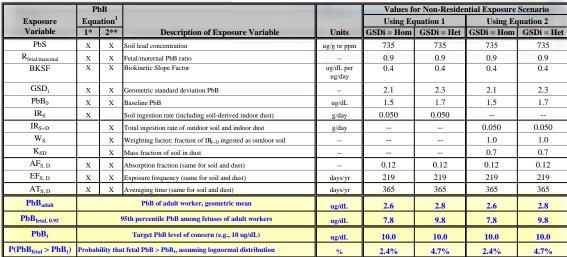

#### Table E-8A

# Calculation of Blood Lead Concentration - Industrial Worker Exposed to Surface Soil at SEAD-121C SEAD-121C AND SEAD-121I RI REPORT Seneca Army Depot Activity

#### Calculations of Blood Lead Concentrations (PbBs)

U.S. EPA Technical Review Workgroup for Lead, Adult Lead Committee

Version date 05/19/03

Equation 1 does not apportion exposure between soil and dust ingestion (excludes W, K<sub>SD</sub>).

When  $IR_S = IR_{S+D}$  and  $W_S = 1.0$ , the equations yield the same PbB<sub>tetal.0.95</sub>

#### \*Equation 1, based on Eq. 1, 2 in USEPA (1996).

| PbB <sub>adult</sub> =       | $(PbS*BKSF*IR_{S+D}*AF_{S,D}*EF_{S}/AT_{S,D}) + PbB_{0}$ |
|------------------------------|--|
| PbB <sub>fetal, 0.95</sub> = | $PbB_{adult} * (GSD_i^{1.645} * R)$                      |

#### \*\*Equation 2, alternate approach based on Eq. 1, 2, and A-19 in USEPA (1996).

| PbB <sub>adult</sub> =       | $PbS*BKSF*([(IR_{S+D})*AF_S*EF_S*W_S] + [K_{SD}*(IR_{S+D})*(1-W_S)*AF_D*EF_D])/365 + PbB_0$ |
|------------------------------|---|
| PbB <sub>fetal, 0.95</sub> = | $PbB_{adult}*(GSD_i^{1.645}*R)$   |

#### Table E-9A

# Calculation of Blood Lead Concentration - Industrial Worker Exposed to Ditch Soil at SEAD-121C SEAD-121C AND SEAD-121I RI REPORT Seneca Army Depot Activity

#### Calculations of Blood Lead Concentrations (PbBs)

U.S. EPA Technical Review Workgroup for Lead, Adult Lead Committee

Version date 05/19/03

Equation 1 does not apportion exposure between soil and dust ingestion (excludes W, K<sub>SD</sub>).

When  $IR_S = IR_{S+D}$  and  $W_S = 1.0$ , the equations yield the same PbB<sub>fetal.0.95</sub>

#### \*Equation 1, based on Eq. 1, 2 in USEPA (1996).

| PbB <sub>adult</sub> =       | $(PbS*BKSF*IR_{S+D}*AF_{S,D}*EF_{S}/AT_{S,D}) + PbB_{0}$ |
|------------------------------|--|
| PbB <sub>fetal, 0.95</sub> = | $PbB_{adult} * (GSD_i^{1.645} * R)$                      |

#### \*\*Equation 2, alternate approach based on Eq. 1, 2, and A-19 in USEPA (1996).

| PbB <sub>adult</sub> =       | $PbS*BKSF*([(IR_{S+D})*AF_S*EF_S*W_S] + [K_{SD}*(IR_{S+D})*(1-W_S)*AF_D*EF_D])/365 + PbB_0$ |
|------------------------------|---|
| PbB <sub>fetal, 0.95</sub> = | $PbB_{adult}*(GSD_i^{1.645}*R)$   |

#### TABLE F-1B

#### CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF SOIL

#### CENTRAL TENDENCY (CT) - SEAD-121I SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x CF x FI x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Soil, mg/kg EF = Exposure Frequency ED = Exposure Duration

IR = Ingestion Rate
CF = Conversion Factor
FI = Fraction Ingested BW = Bodyweight
AT = Averaging Time Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

#### TABLE F-2A

#### CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO SOIL

#### REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121I SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) =  $\underline{EPC \times CF \times SA \times AF \times ABS \times EV \times EF \times ED}$ 

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):

 $\begin{array}{ll} EPC = Exposure \ Point \ Concentration \ in \ Soil, \ mg/kg & EV = Event \ Frequency \\ CF = Conversion \ Factor & EF = Exposure \ Frequency \\ \end{array}$ 

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

N/A= Information not available.

AT (Nc) =

Absorption factors for chromium, manganese, thallium, and vanadium were assumed to be 0.001 in accordance with the USEPA Region 4 (2000)

Supplemental Guidance to RAGS: Region 4 Bulletins, Human Health Risk Assessment Bulletins (http://www.epa.gov/region4/waste/ots/healtbul.htm).

<sup>\*</sup> Absorption factors from Exhibit 3-4 of USEPA (2004) Supplemental Guidance for Dermal Risk Assessment, Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume I).

#### TABLE F-3A

## CALCULATION OF INTAKE AND RISK FROM INHALATION OF DUST IN AMBIENT AIR REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121I SOIL

#### SEAD-121C AND SEAD-121I RI REPORT

#### Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x EF x ED
BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = EPC in Air, mg/m³

EQUation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

EPC = EPC in Air, mg/m³

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

EQUATION AT = Averaging Time

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

(2) This EPC was used for the construction worker.

<sup>(1)</sup> This EPC was used for the industrial worker and the adolescent trespasser.

#### TABLE F-3B

#### CALCULATION OF INTAKE AND RISK FROM INHALATION OF DUST IN AMBIENT AIR $\,$

#### CENTRAL TENDENCY (CT) - SEAD-121I SOIL SEAD-121C AND SEAD-121I RI REPORT

#### Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x EF x ED
BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = EPC in Air, mg/m³

ED = Exposure Duration
BW = Bodyweight
EF = Exposure Frequency

ED = Exposure Frequency

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Gancer Risk = Chronic Daily Intake (Car) x Slope Factor

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

(1) This EPC was used for the industrial worker and the adolescent trespasser.

(2) This EPC was used for the construction worker.

#### TABLE F-4A

#### CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF DITCH SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-1211

#### SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x CF x FI x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Ditch Soil, mg/kg EF = Exposure Frequency IR = Ingestion Rate

ED = Exposure Duration
BW = Bodyweight
AT = Averaging Time CF = Conversion Factor FI = Fraction Ingested

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

#### TABLE F-4B

#### CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF DITCH SOIL

#### CENTRAL TENDENCY (CT) - SEAD-121I SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x CF x FI x EF x ED

BW x AT

FI = Fraction Ingested

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Ditch Soil, mg/kg IR = Ingestion Rate EF = Exposure Frequency ED = Exposure Duration BW = Bodyweight AT = Averaging Time CF = Conversion Factor

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

#### TABLE F-5A

# CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO DITCH SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121I SEAD-121I RI REPORT

#### Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x CF x SA x AF x ABS x EV x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = Exposure Point Concentration in Ditch Soil, mg/kg

CF = Conversion Factor SA = Surface Area Contact AF = Adherence Factor ABS = Absorption Factor EV = Event Frequency EF = Exposure Frequency

ED = Exposure Duration
BW = Bodyweight
AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Supplemental Guidance to RAGS: Region 4 Bulletins, Human Health Risk Assessment Bulletins (http://www.epa.gov/region4/waste/ots/healtbul.htm).

<sup>\*</sup> Absorption factors from Exhibit 3-4 of USEPA (2004) Supplemental Guidance for Dermal Risk Assessment, Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume I).

Absorption factors for iron, manganese, and thallium were assumed to be 0.001 in accordance with the USEPA Region 4 (2000)

#### TABLE F-5B

#### CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO DITCH SOIL

#### CENTRAL TENDENCY (CT) - SEAD-121I SEAD-121C AND SEAD-121I RI REPORT

Seneca Army Depot Activity

EPC x CF x SA x AF x ABS x EV x EF x ED Equation for Intake (mg/kg-day) =

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Ditch Soil, mg/kg CF = Conversion Factor

SA = Surface Area Contact

EV = Event Frequency

AF = Adherence Factor ABS = Absorption Factor EF = Exposure Frequency ED = Exposure Duration BW = Bodyweight AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

This EPC was used for the industrial worker and the adolescent trespasser.
 This EPC was used for the construction worker.

#### TABLE F-6B

## CALCULATION OF INTAKE AND RISK FROM INHALATION OF DUST IN AMBIENT AIR

# CENTRAL TENDENCY (CT) - SEAD-121I DITCH SOIL SEAD-121C AND SEAD-121I RI REPORT

#### Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x EF x ED
BW x AT
Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = EPC in Air, mg/m³
ED = Exposure Duration
BW = Bodyweight
EF = Exposure Frequency
BW = Bodyweight
AT = Averaging Time

COPC = Chemicals of Potential Concern

BAF = Bioaccumulation factor SP = Soil-to-plant uptake factor

1. Values from USEPA. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities .

Peer Review Draft.

Values for VOCs or SVOCs not available in USEPA 1999 were calculated using the following equation

based on the equations presented in USEPA 2005 Eco-SSL, Attachment 4-1 and USEPA 1996 Soil

Screening Guidance Technical Background Document. Fraction of organic carbon in soil

was assumed to be 1% and earthworm water content was assumed to be 84% .

For SVOC: BCF= $(16\% \times 10^{0.87 log Kow-2})/(1\% \times 10^{0.983 log kow+0.00028})$ 

For VOC: BCF= $(16\% \times 10^{0.87 \log Kow-2})/(1\% \times 10^{0.7919 \log kow+0.0784})$ 

LogKow from USEPA (2004) Supplemental Guidance for Dermal Risk Assessment, USEPA (1999), or

 $RAIS~(http://risk.lsd.ornl.gov/tox/tox\_values.shtml).$ 

The values for bis(2-ethylhexyl)phthalate, di-n-octylphthalate, and hexachlorobenze were based on the above equations as the values presented in USEPA (1999) were based on equation published from earlier literature.

The value for Benzo(a)pyrene was used for PAHs with no bioaccumulation values in the USEPA document.

The value for 4,4'-DDE was used for 4,4'-DDT and 4,4'-DDD.

The value for total chromium was used for chromium and chromium (VI).

### TABLE G-1

# CHEMICAL-SPECIFIC UPTAKE FACTORS

# SEAD-121C and SEAD-121I RI Report

Seneca Army Depot Activity

| COPC | Soil-To-Soil Invertebrate 1 | Small Mammal BAF <sup>2</sup> | Soil-To-Plant <sup>3</sup> |
|------|-----------------------------|-------------------------------|----------------------------|
|      | (mg COPC/kg wet             | (mg COPC/kg wet tissue)/(mg   | (mg COPC/kg dry            |
|      | tissue)/(mg COPC/kg dry     | COPC/kg dry soil)             | tissue)/(mg COPC/kg        |
|      | soil)                       |                               | dry soil)                  |

The value for endrin was used for endrin ketone.

The value for mercuric chloride was used for mercury

For metals without USEPA recommended values, the median value from USEPA (2003) Table 8 (Attachment 4-1) or the arithmetic mean of the recommended values for the available metals was used.

The value for endosulfan I was used for endosulfan II.

The value for alpha chlordane was used for gamma chlordane.

 Values for inorganics were from Baes, et al., 1984. A Review and Analysis of Parameters for Assessing Transport of Environmentally Released Radionuclides through Agriculture.

Values for organics were from USEPA (1999) Table D-3. The highest value for terrestrial mammals was used.

BCF for Aroclor 1254 was used for Aroclor 1260 and 1242. BCF for 4,4'-DDE was used for 4,4'-DDD and 4,4'-DDT.

BCF for heptachlor was used for heptachlor epoxide.

Values for organics were based on equation provided in USEPA (2003), attachment 4-1. lgBAF=0.338-0.145lgKow.

The value for endrin was used for endrin ketone.

The value for endosulfan I was used for endosulfan II.

The value for alpha chlordane was used for gamma chlordane.

No BCF data were available for cyanide and a default value of 1 was assumed.

3. Values from USEPA. 1999. Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities. Peer Review Draft. 1999.

For PAHs and pesticides, the values were calculated based on the model presented in Travers et al., 1988: logBCF=1.588-0.578xlogKow,

The value for 4,4'-DDE was used for 4,4'-DDT and 4,4'-DDD.

The value for Aroclor 1254 was used for Aroclor 1260 and 1242.

The value for total chromium was used for chromium and chromium (VI).

Values for cobalt and iron were from NRC. 1992. US Nuclear Regulatory Commission. Residual Radioactive Contamination from Decommissioning: Technical Basis for Translating Contamination Levels to Annual Total Effective Dose Equivalent.

The value for mercuric chloride was used for mercury

A default value of 1 was used for cyanide.

Values for manganese and vanadium were from Baes, et al., 1984. A Review and Analysis of Parameters for Assessing Transport of Environmentally Released Radionuclides through Agriculture.

|      |                           |                    |                          | SP (mg COPC/kg    | (mg COPC/kg wet   | Surface Soil | Deer Mouse          |
|      | Surface Soil (0-2 ft bgs) | Total Soil (0-4 ft | <b>Surface Water EPC</b> | dry tissue)/(mg   | tissue)/(mg       | Exposure     | Total Soil Exposure |
| COPC | EPC (mg/kg)               | bgs) EPC (mg/kg)   | (mg/L)                   | COPC/kg dry soil) | COPC/kg dry soil) | (mg/kg/day)  | (mg/kg/day)         |

COPC = Chemical of Potential Concern

EPC = Exposure Point Concentration, the maximum detected concentration

BAF = Bioaccumulation Factor (unitless)

SP = Soil to plant uptake factor (unitless)

(1) Exposure = [((Cs\*SP\*CF\*PDF\*FR) + (Cs\*IDF\*BAF\*FR) + (Cs\*Is) + (Cw\*WR))\*SFF]/BW

Cs = EPC in the appropriate soil exposure interval (mg COPC/kg dry soil)

SP = Soil-to-plant uptake factor ((mg COPC/kg dry tissue)/(mg COPC/kg dry soil))

CF = Dry weight to wet weight plant matter conversion factor = 0.2 (unitless)

PDF = Plant dietary fraction (unitless)

FR = Feeding rate (kg/day)

IDF = Invertebrate dietary fraction (unitless)

Is = Soil dietary (kg dry/day)

Cw = EPC in surface water (mg COPC/L)

WR = Water intake rate (L/day)

SFF = Site foraging frequency = 1 (unitless)

COPC = Chemical of Potential Concern

EPC = Exposure Point Concentration, the maximum detected concentration

BAF = Bioaccumulation Factor (unitless)

SP = Soil to plant uptake factor (unitless)

(1) Exposure = [((Cs\*SP\*CF\*PDF\*FR) + (Cs\*IDF\*BAF\*FR) + (Cs\*Is) + (Cw\*WR))\*SFF]/BW

Cs = Soil concentration (mg/kg)

SP = Soil tp plant uptake factor from literature

CF = Dry weight to wet weight plant matter conversion factor = 0.2 (unitless)

PDF = Plant dietary fraction (unitless)

FR = Feeding rate (kg/day)

IDF = Invertebrate dietary fraction (unitless)

Is = Soil dietary (kg dry/day)

Cw = EPC in surface water (mg COPC/L)

WR = Water intake rate (L/day)

SFF = Site foraging frequency = 1 (unitless)

COPC = Chemical of Potential Concern

EPC = Exposure Point Concentration, the maximum detected concentration

BAF = Bioaccumulation Factor (unitless)

SP = Soil to plant uptake factor (unitless)

(1) Exposure = [((Cs\*SP\*CF\*PDF\*FR) + (Cs\*IDF\*BAF\*FR) + (Cs\*Is) + (Cw\*WR))\*SFF]/BW

Cs = Soil concentration (mg/kg)

SP = Soil tp plant uptake factor from literature

CF = Dry weight to wet weight plant matter conversion factor = 0.2 (unitless)

PDF = Plant dietary fraction (unitless)

FR = Feeding rate (kg/day)

IDF = Invertebrate dietary fraction (unitless)

Is = Soil dietary (kg dry/day)

Cw = EPC in surface water (mg COPC/L)

WR = Water intake rate (L/day)

SFF = Site foraging frequency = 1 (unitless)

COPC = Chemical of Potential Concern

EPC = Exposure Point Concentration, the maximum detected concentration

 $BAF = Bioaccumulation\ Factor\ (unitless)$ 

SP = Soil to plant uptake factor (unitless)

(1) Exposure = [((Cs\*SP\*CF\*PDF\*FR) + (Cs\*IDF\*BAF\*FR) + (Cs\*Is) + (Cw\*WR))\*SFF]/BW

Cs = EPC in the appropriate soil exposure interval (mg COPC/kg dry soil)

 $SP = Soil\text{-to-plant uptake factor} \ ((mg\ COPC/kg\ dry\ tissue)/(mg\ COPC/kg\ dry\ soil))$ 

CF = Dry weight to wet weight plant matter conversion factor = 0.2 (unitless)

PDF = Plant dietary fraction (unitless)

FR = Feeding rate (kg/day)

IDF = Invertebrate dietary fraction (unitless)

Is = Soil dietary (kg dry/day)

Cw = EPC in surface water (mg COPC/L)

WR = Water intake rate (L/day)

SFF = Site foraging frequency = 1 (unitless)

COPC = Chemical of Potential Concern

EPC = Exposure Point Concentration, the maximum detected concentration

BAF = Bioaccumulation Factor (unitless)

SP = Soil to plant uptake factor (unitless)
(1) Exposure = [((Cs\*SP\*CF\*PDF\*FR) + (Cs\*IDF\*BAF\*FR) + (Cs\*Is)+(Cw\*WR))\*SFF]/BW

Cs = Soil concentration (mg/kg)

 $SP = Soil \ tp \ plant \ uptake \ factor \ from \ literature$ 

CF = Dry weight to wet weight plant matter conversion factor = 0.2 (unitless)

PDF = Plant dietary fraction (unitless)

FR = Feeding rate (kg/day)

IDF = Invertebrate dietary fraction (unitless)

Is = Soil dietary (kg dry/day)

Cw = EPC in surface water (mg COPC/L) WR = Water intake rate (L/day)

SFF = Site foraging frequency = 1 (unitless)

# APPENDIX H RESPONSE TO COMMENTS

#### Army's Response to Comments from the US Environmental Protection Agency

**Subject**: Draft Field Sampling Report for SEAD 121C & 121I Seneca Army Depot Romulus, New York

Comments Dated: March 24, 2004 (received by email)

Date of Comment Response: November 4, 2004

#### **Army's Response to Comments**

#### I. GENERAL COMMENTS

**Comment 1**: The areas at SEAD-121C that are referred to frequently throughout the document as containment area," "storage cells," and the "former concrete storage pad" should be shown on all appropriate figures (i.e., Figure 1-3, Figure 3-1, etc..) Numerous references to, these objects relative to associated samples are made in the document, yet they are not shown on any figure. Provide additional documentation of these areas.

**Response 1:** Based on field notes collected during the 2002 field effort, and after review of GIS aerial photographs from 2000 obtained from the State of New York, storage cells, concrete barriers, and debris piles have been known to exist at the DRMO Yard. It should be noted that these features are transitory; changing as material has been moved into and out of the Yard. However, for the purposes of presentation, the approximate locations of these based on the 2000 photographs have been added.

As stated in response to USEPA comments on the Work Plan, there is no available information regarding the location of a rumored concrete pad. Therefore, this feature is not included on site figures.

**Comment 2:** The various discussions related to surface and subsurface soil samples are unclear and inconsistent. For example, four samples were collected at depths of 0 to 2 inches bgs at the DRMO Yard during the EBS sampling, and are described as soil borings (Page 3-2). However, the twenty samples collected from soil borings at locations in the DRMO Yard during the RI are considered to be surface samples, although they were collected from 0 to 2 feet bgs (Page 3-3). List the sample depths in Table 3-2 (or similar table) and revise callouts accordingly.

**Response 2:** The Army collected surface soil samples from a depth of 0 to 2 inches below grade surface or beneath the vegetative root ball/cover material. A split spoon was advanced to 2 ft., but the sample was collected from the top 2 inches of the spoon, where vegetative root material, asphalt, or cover materials were not found. The text has been clarified.

Army's Response to USEPA Comments on Draft Field Sampling Report for SEAD 121C & 121I Comments Dated March 24, 2004 Page 2 of 9

The depth of each sample has been added to the revised Table 3-2

Comment 3: Text indicates that the purpose of surface water sampling at SEAD-1211 was to determine background surface water concentrations at areas at the site that have not been impacted by site activities as well as to delineate the extent of contamination at the site. However, as described in Section 3.2.5, four surface water samples were collected immediately around the site (only two upgradient), while the other three were collected at a drainage ditch downgradient of the site that serves as the outfall for drainage from a large area. Therefore, it does not appear that sufficient surface water samples were collected upgradient of the site to provide a baseline for background (or areas not impacted by the site) to characterize background surface water concentrations. In addition, the three samples collected in the downgradient drainage ditch may contain runoff materials from other sites. Additional upgradient (background) samples and delineation samples should be collected.

**Response 3:** The Army wishes to emphasize that there is no continuous source of surface water located within the bounds of the Rumored Cosmoline Oil Disposal Area. All surface water located at this site is temporal, generally associated with either storm or snowmelt events. Surface water locations that are present within the bounds of the site are restricted to runoff ditches, culverts or infiltration galleries and buried stormwater sewers that convey storm event runoff to locations west of the warehousing area where it is discharged into the headwaters of Kendaia Creek. Additionally, the Army must reiterate that a work plan for this investigation was provided to the EPA prior to the initiation of this effort, and no comments were received indicating that the proposed sampling plan for surface water was insufficient.

Having said this, the Army believes that the surface water in the vicinity of the Rumored Cosmoline Oil Disposal Area has been adequately characterized. Two upgradient, three downgradient and two surface water samples from locations within the site were collected and characterized. No organic contaminants, including TPH, were identified in either of the upgradient samples, while a total of 14 different metals were found in one or more of the two upgradient samples. However, of the 14 metals detected, only lead and aluminum were found at levels above the New York Class C surface water standards, and these were both collocated in the same sample. Similarly, 14 metals and no organic contaminants or TPH, were found at the downgradient sample locations, but in this case none of the detected concentrations were found at levels exceeding the New York Class C standards. Finally, two organic, but not TPH, and up to 17 metal contaminants were identified in the temporal surface water samples that were collected from within the bounds of the Cosmoline oil site. Of these 19 identified contaminants, only four of the metals were found at levels exceeding the Class C surface water standards. Given this information, it is clear that there is no evidence of contaminant transport

Army's Response to USEPA Comments on Draft Field Sampling Report for SEAD 121C & 121I Comments Dated March 24, 2004 Page 3 of 9

to locations downgradient of the Cosmoline oil site. Therefore, the Army does not consider further surface water sampling necessary.

**Comment 4:** For reference, the New York State DEC Technical and Administrative Guidance Memorandum (TAGM) #4046 values should be included in the text where appropriate in Section 4. This will provide the information necessary while reviewing the site- and media- specific analytic results.

**Response 4:** For the purposes of comparison, the TAGM #4046 guidance value for each parameter and the number of times the TAGM value was exceeded have been added to the summary statistics tables for soils presented in Section 4 (Tables 4-1, 4-2, 4-6, 4-7, and 4-9).

#### II. SPECIFIC COMMENTS

**Comment 1:** Executive Summary, Page E-1: Include chemical oxygen demand (COD), alkalinity, ammonia, hardness, phosphates, and nitrate-nitrite/nitrogen in the list of chemical analyses performed, because these analyses were performed on samples collected during the RI portion of the investigation (as per Table 2-5).

**Response 1:** The text of the *Executive Summary* is correct, and the list of analytes included in Table 2-5 is in error. Analysis for COD, hardness, nitrate-nitrite/nitrogen, and TDS were not performed. Table 2-5 has been revised accordingly. In addition, Tables 2-2 through 2-4 were revised to accurately reflect the analysis performed for each media.

**Comment 2:** Section 1.3.2. Page 1-3: One goal of the investigation at SEAD-121I was to investigate the potential for contamination at the site resulting from Cosmoline. However, minimal description or discussion of this compound or its military use has been included in the text. Revise this section to describe the nature and use of Cosmoline, and potential contaminants associated with it.

**Response 2:** Cosmoline is a substance used to prevent corrosion, and it is commonly used to protect metallic components during shipment and storage. According to a material safety data sheet (MSDS) prepared by Goodson Shop Supplies, Cosmoline is composed of a complex mixture of petroleum hydrocarbons, severely hydrotreated heavy naphthenic distillate, Stoddard solvent, wool grease, and butyl stearate. No adverse chronic health effects have been reported due to exposure to Cosmoline. Acute health effects are generally limited to irritation, depending on the duration of the contact. A MSDS for Cosmoline has been included as Appendix D.

This information has been added to the text.

Army's Response to USEPA Comments on Draft Field Sampling Report for SEAD 121C & 121I Comments Dated March 24, 2004 Page 4 of 9

**Comment 3:** Section 2.2.1, Page 2-3: In the second paragraph of this section, revise text to read "This survey procedure was not employed during the EBS sampling program because the wells installed during this investigation were temporary."

**Response 3:** The text has been revised accordingly.

**Comment 4:** Section 2.2.3, Page 2-7: Include in this section the season(s) in which the surface water samples were collected at both SEAD-121C and SEAD-121I.

**Response 4:** The surface water samples were collected in the fall of 2002. This information has been added to the text.

**Comment 5:** Section 2.2.4.3, Page 2-11: The fifth full paragraph of this section indicates the sampling order for groundwater samples collected during the RI portion of the investigation. This order includes VOCs, SVOCs, metals, pesticides/PCBs, cyanide, and TOC/COD. Table 2-5 indicates that groundwater was also sampled for total petroleum hydrocarbons (TPH), hardness. nitrate-nitrite/nitrogen, and total dissolved solids (TDS). Revise the sampling order to include all analyses performed. The same comment applies to text in Section 4.1 on Page 4-2, which excludes these same analyses.

**Response 5:** The analyte list provided in this section was written in error. As discussed in Response to Specific Comment 1, analysis for TOC and COD were not performed, while analysis for TRPH was performed.

For groundwater, the correct sampling order is (1) VOCs, (2) SVOCs, (3) Metals, (4) pesticides/PCBs, (5) cyanide, and (6) TRPH. The text has been revised accordingly. Response 1 notes that Table 2-5 has been revised as well.

Section 4.1 is correct and does not require revision.

**Comment 6:** Section 3.1.4.1, Page 3-2: The text in the "RI Program" section contains should be revised. The sentence, "The sampling interval from 2-4 ft...as one sample" erroneously appears to refer to the four soil borings that contained large amounts of rock which was discussed in the previous sentence (SB121C-2, -8, -15, and -19), and which were sampled only from 0-2 ft bgs.

Army's Response to USEPA Comments on Draft Field Sampling Report for SEAD 121C & 121I Comments Dated March 24, 2004 Page 5 of 9

Revise discussion of sampling depths in the first paragraph, and discussion of sampling of borings SB121C-2, -8, -15, and -19. Clarify that the VOC samples in the composited 2-4 and 4-6 ft bgs sampling intervals were not composited.

Also, confirm that these four borings were sampled from 0 to 2 *feet* bgs, not 0 to 2 *inches* bgs as indicated in the fifth sentence of this section and also on Page 2-5 of Section 2.2.2.1.

**Response 6:** The text has been revised to state,

"At these four soil borings, a substantial sample could not be collected from the deeper sampling interval; thus the interval from 0 to 2 ft. was the only one collected for analysis. At the other twelve soil borings, the sampling interval from 2-4 ft. bgs and 4-6 ft. bgs were composited at each hole location as a result of the high rock content and collected as one sample."

The VOC samples were not composited; rather, the soil samples for VOC analysis were collected from the depth interval of 2-4 ft. only.

The first interval is 0 to 2 feet. Thus, the text in this section has been revised to indicate 0 to 2 feet, as shown above. The text on page 2-5 has been revised as well.

**Comment 7:** Section 3.1.4.2, Page 3-3: Include sample depths of surface soil samples in the text. Also clarify that these samples were the top interval of the soil borings described in the first portion of Section 3.1.4.1.

**Response 7:** The text has been clarified.

**Comment 8:** Section 3.5, Page 3-3; Confirm that ditch soil samples described in this section were collected from 0 to 2 inches bgs.

**Response 8:** The depth range for ditch soil is defined as 0 to 2 inches. In practice, ditch soil samples were collected from the top of the depth interval. Because the ditch soil samples did not seem to vary in character or nature from the surface soil samples (collected from 0 to 2 inches), the ditch soil samples were grouped as surface soil for the purpose of discussion. The text has been clarified.

**Comment 9:** Section 3.1.6, Page 3-4: Revise the first sentence to read that "There were *no* surface water... field program."

Army's Response to USEPA Comments on Draft Field Sampling Report for SEAD 121C & 121I Comments Dated March 24, 2004 Page 6 of 9

**Response 9:** The text has been revised accordingly.

**Comment 10:** Section 3.1.7.1, Page 3-6: The section entitled "RI Program" indicates that four wells with a designation starting with "MWDRMO" were installed in the DRMO Yard during the RI investigation. However, the groundwater sampling section, Section 3.1.7.3 refers to permanent well locations with designations starting with "MWI2IC." Additionally, wells with a designation "MWDRMO" are not included in Tables 3-1, 3-7, 3-8, 3-9, 3-10, or 3-11, all of which include information related to the permanent wells at the DRMO Yard. Clarify text if necessary to report on permanent wells installed at the DRMO Yard.

**Response 10:** The well designations should start with "MW121C" and not "DRMO". The text has been revised accordingly.

**Comment 11:** Section 3.1.8.1, Page 3-7: Text in this section indicates that the first round of elevation data was collected on the day of well development. For consistency, include the date of this activity (apparently mid-January 2003) in this section (as well as in Table 3-11) to facilitate comparison to the second, third, and final rounds of measurements.

**Response 11:** Groundwater elevations were collected on October 29, 2002, January 17, 2003, and February 2, 2003, and May 7, 2003. The text and Table 3-11 have been revised to include this information.

**Comment 12:** Section 3.2.4.2, Page 3-8: The text in this section indicates that five soil borings were completed at SEAD-121I during the RI investigation. Indicate in this section whether the borings were sampled, and if so, the number of samples collected per boring.

**Response 12:** A soil sample was collected from each boring at a depth interval of 0 to 2 ft. The text has been revised to incorporate this information. A soil boring was advanced and a sample was collected from the top interval at 0-2 inches in each of the five borings. The auger encountered refusal, therefore additional samples at greater depths were not collected.

**Comment 13:** Section 3.2.4.3, Page 3-8: Include the sample depths for the four surface soil samples collected at SEAD-121I during the EBS sampling round.

**Response 13:** The surface soil samples were collected from a depth range of 0-0.2 ft. This information has been added to the text.

Army's Response to USEPA Comments on Draft Field Sampling Report for SEAD 121C & 121I Comments Dated March 24, 2004 Page 7 of 9

**Comment 14:** Section 3.2.6, Page 3-11: The text in this section indicates that no groundwater monitoring wells were installed at SEAD-121I due to shallow refusal. In lieu of discussion of groundwater at this site, include a discussion of the nearest monitoring wells to SEAD121I and the results of any sampling of these wells that is applicable to SEAD-121I.

**Response 14:** There are no wells at SEAD-121I (as well as at the neighboring SWMU, SEAD-68) since the site is located very near, or at, the top of the apparent groundwater divide, and there is no saturated thickness in the overburden aquifer. A few wells are located downgradient of SEAD-121I, and they are associated with other SWMUs and are potentially impacted by CERCLA and non-CERCLA releases that have occurred in the overall PID Area. Therefore, any attempt to correlate offsite wells with conditions present at SEAD-121I would have many interferences that would make such comparisons virtually meaningless. Therefore, the Army will not provide any discussion of chemistry and will limit its discussion of offsite wells merely to the fact that they exist and do.

**Comment 15:** Section 4.2, Page 4-3: It appears as though discussion of cyanide results has been omitted from this section even though Tables 2-2 through 2-4 indicate that it was included in the sample analyses for soils, surface water, and ditch soil at SEAD-121C. Similarly, the groundwater section does not include results of COD, hardness, nitrite-nitrate/nitrogen, or TDS although these analyses were reportedly collected from wells at SEAD-121C. Revise as appropriate.

**Response 15:** At the DRMO Yard, cyanide (total and amenable) was not detected in any surface soil, subsurface soil, surface water, and groundwater samples. Cyanide was detected once in ditch soil at SDDRMO-4 at an estimated concentration of 2.36 J mg/Kg. At SEAD-121I, total cyanide was detected at three surface soil locations, with a maximum concentration of 2.73 mg/Kg at SS121I-29. Cyanide was not detected in the surface water or ditch soil at SEAD-121I. Discussions of cyanide results for each media where cyanide was detected have been added to the text. As noted in previous responses, analysis for COD, hardness, nitrite-nitrate/nitrogen, and TDS was not performed. Any reference to these analyses has been removed from the text.

**Comment 16:** Section 4.2, Page 4-7: Signs of soil contamination beyond the boundaries of SEAD-121C are discussed throughout this section. However, those signs are dismissed as either anthropogenic background or source unrelated to SEAD-121C. Please note that any exceedances beyond EPA Region 9 preliminary remedial goals (PRGs) industrial screening levels need further investigation and/or remedial action as per CERCLA. Your anthropological background position has never been formally presented or accepted by the

Army's Response to USEPA Comments on Draft Field Sampling Report for SEAD 121C & 121I Comments Dated March 24, 2004 Page 8 of 9

regulatory agencies, and it is considered highly unlikely that such levels of contaminants would have found their way to these areas apart from Army-related operations.

**Response 16:** The Army has been unable to identify any promulgated standard or law that states that Region 9 PRGs trigger the need for further investigation or action. However, the Army has identified the October 1, 2002 EPA Region 9 PRG update, which states that chemical concentrations exceeding PRG levels do not "trigger a response action."

"Exceeding a PRG suggests that further evaluation of the potential risks that may be posed by site contaminants is appropriate. Further evaluation may include additional sampling, consideration of ambient levels in the environment, or a reassessment of the assumptions contained in these screening-level estimates."

There is no mention that exceeding a PRG warrants remedial action. "The PRG table is specifically not intended as a . . . set of final cleanup or action levels to be applied at contaminated sites".

In the Sampling Report, the Army presented specific site conditions that could be potential sources for elevated chemical concentrations detected in locations beyond the boundary of the site. If EPA disagrees with this statement, the Army requests that they present an argument to that effect; EPA's statement that this contention "is considered highly unlikely" is insufficient and unsupported.

**Comment 17:** Figures 3-1 and 3-2: Include the direction of flow of surface water on these figures.

**Response 17:** The figures have been revised accordingly.

**Comment 18:** <u>Table 2-5:</u> The table summarizes the groundwater sampling completed at SEAD-121C, but the internal heading in the table refers to SEAD-121I. Revise accordingly.

**Response 18:** The table has been revised accordingly.

**Comment 19:** Tables 4-1, 4-2, 4-6, 4-7, 4-9: For consistency, revise these tables to include the appropriate TAGM #4046 values ("criteria") for each parameter as was done in Tables 4-3 through 4-5 and 4-8 (groundwater and Surface water).

**Response 19:** The TAGM #4046 values are guidance values or criteria to be considered (TBCs) and not ARARs. However, for the purposes of comparison, the TAGM #4046 guidance value for each parameter and the number of times the TAGM value was exceeded have been added to the summary statistics tables for soils presented in Section 4.

Army's Response to USEPA Comments on Draft Field Sampling Report for SEAD 121C & 121I Comments Dated March 24, 2004 Page 9 of 9

**Comment 20:** Section 4.3, Page 4-21: The second to last paragraph erroneously locates SD121I samples 1, 2 and 3 east of SEAD-121I.

**Response 20:** These samples are located to the west of the site. The text has been revised accordingly.

**Comment 21:** Section 4.3, page 4-7: See comment 16 above. This section presents the same types of justification for contaminants found outside the site boundaries.

**Response 21:** See response to comment 16 above.

**Comment 22:** Section 6.2, Page 6-1: We do not agree with the "no further investigation/no action" recommendation for this site. Section 4.2 shows significant levels of metal concentrations related to the existing ferrous-manganese ores at this site. Therefore, some kind of controls or remedial work seems to be needed at this site.

Response 22: The site that is the subject of this investigation is the Rumored Cosmoline Oil Disposal Area, and the BRAC program was tasked with investigating this site for contamination associated with Cosmoline oil. Contaminants detected at the site are not consistent with the presence of Cosmoline oil. According to information provided in the MSDS, the main components of Cosmoline oil are a mixture of complex hydrocarbons (e.g., Stoddard solvent), and naphthenic distillate. Naphthalene was detected in only 7 of 52 samples and never exceeded the TAGM level. If Cosmoline oil were present at the site, then it seems likely that heavy hydrocarbons would have been detected in the soils. As the best indicator, the TPH data was reviewed. TPH was detected at 14 locations in the surface soils at scattered locations across SEAD-121I. Due to the delocalized presence of TPH and the absence of significant levels of naphthalene, there is no evidence of a systemic release of Cosmoline oil at the site.

Currently, the location of SEAD-121I is being used as a staging site for planned strategic stockpiles of ferrous-manganese ore. All metals detected appear to be associated with these ore piles. The stockpiles are strategic materials; they are not a waste and are not covered under the CERCLA program. At the time that the strategic piles are removed, residues associated with the historic stockpiling activities will be addressed by the DoD through the authority responsible for management of the piles. Therefore, no further action is warranted for this site under CERCLA by the BRAC office.

# **Response to US EPA Comments**

on the

Draft Final Remedial Investigation Report for SEAD-121C & 121I, Seneca Army Depot Activity, Romulus, New York Dated 10/31/05

Response Date: 4/27/06

## **GENERAL COMMENTS**

The subject document makes reference to non-CERCLA language in an effort to justify release exemption. Please note that there is no statutory or regulatory exemption for strategic/logistic materials (i.e., national strategic stockpile). As for the statement concerning "no indication of a systemic or wide-spread release" and "no evidence of a systematic release"— again, there is no exemption from CERCLA based on a de minimis or de micromis nature of a release. It does not matter that a release be systematic or not.

**Response:** The Army was not attempting to justify an exemption for the release of metals at SEAD-121I; however, phrases that may have been interpreted as such by the EPA (see page 6-48, 6-50, 7-50, and 7-52, etc.) will be removed.

The Army's identification of the ferro-manganese ore piles as strategic materials is a statement of fact; these materials have been staged at the Seneca Army Depot as part of the United States' Strategic Stockpile program. In several locations throughout the document, the Army has indicated that it believes that metal contaminants found at SEAD-121I are associated with the management of the strategic ore piles. Additionally, the Army has evaluated and enumerated the apparent risks that the presence of the identified strategic stockpiles is posing to human health and the environment at the site.

The Army's use of phrases such as "no indication of a systemic or wide-spread release" or "no evidence of a systemic release" was not intended to request an exemption. Again, as was the case of the metals identified around the strategic ore piles, contaminants identified at both sites have been evaluated and their risks enumerated in the risk assessment that has been presented in this document. The risks at both sites have been summarized.

SEAD-121I is known as the Rumored Cosmoline Disposal Area; investigations performed at this site were implemented to address concerns that Cosmoline oil or similar materials may have been released during the historic unpacking and cleanup of equipment and parts previously delivered to the Depot. Based on the data collected and evaluated at SEAD-121I as part of these investigations, there is no evidence that any significant risk results from Cosmoline oil-like substances (i.e., organic hazardous

substances) at the site. Therefore, the Army believes that this site, SEAD-121I, the Rumored Cosmoline Oil Disposal Area does not pose a problem that is subject to further regulatory review under CERCLA.

The data and information collected during the investigations indicate that metals are present at the site and that the identified metals are associated with the United States' long-term management of the strategic stockpiles of ferro-manganese at this site. Metal compound residues that remain at SEAD-121I once the ore piles are removed will be addressed as part of the United States' stockpile management program. SEDA has notified personnel responsible for the removal and relocation of the ore piles that metal contamination is present; and have indicated that it currently poses a risk to human receptors.

## **SPECIFIC COMMENTS**

## **Comment:**

Page 6-4, first paragraph - This paragraph explains potential sources of the PAHs that were detected in the soil at SEAD-121I. Although the roofing and maintenance operations may contribute to the PAHs detected at the site, there may be other potential sources, such as runoff from the roads (e.g., asphalt, oil from vehicles, creosote from railroad ties [as mentioned on page 6-6, second paragraph]) and oil leaks from vehicles that utilize the area associated with SEAD-121I, as well as atmospheric deposition. In order to better characterize the source, it would be beneficial to provide documented evidence that the type of PAHs, as well as the ratios observed, are similar to the hypothesized source(s). In addition, comparison to background levels, again by type and ratio of PAHs, observed in soils from other areas that are not impacted by site-related PAHs would enhance this paragraph.

**Response:** The Army agrees that there may be other sources, such as roadway runoff, leaching from railroad ties, dripping from railroad equipment, etc. contributing to the identified PAH levels detected at SEAD-121I. The Army's purpose for mentioning roofing activities and truck traffic was to use knowledge of activities performed in the area to tag sources that are most likely to have contributed to the PAH contamination identified.

While the information identified by the EPA commenter would most probably add to the overall discussion, it is not the Army's intention to mount a research study to obtain the information. Further, and more importantly, contaminants identified at the site have been documented, and their risk potential has been enumerated.

Table 6-12B summarizes the risks determined for an Industrial Worker, a Construction Worker, and an Adolescent Trespasser in SEAD-121I. Hazardous Indices (HIs) in excess of 1 are calculated for the Industrial Worker and Construction Worker when they are exposed to either soil or ditch soil at either

Reasonable Maximum Exposure (RME) or Central Tendency (CT) concentrations. Metals contaminants, primarily manganese, are the primary cause of the elevated His reported. Cancer Risks in the range of 1 x  $10^{-4}$  to 1 x  $10^{-6}$  were calculated for the Industrial Worker and the Construction Worker when they are exposed to either soil or ditch soil at RME and CT concentrations. The Adolescent Trespasser also exhibited a cancer risk of 1 x  $10^{-6}$  when exposed to RME concentrations of ditch soil. The PAHs are the principal contaminants identified in the soil/ditch soil that account for the identified levels of cancer risk, although Arsenic is also a noted contributor.

As is noted above, the elevated HIs attributable to manganese and a few other metals will be addressed as part of the United States' Strategic Stockpile management program. While PAHs have been identified in the soil and ditch soils at SEAD-121I, they are found at concentrations that do not cause risk above normally accepted industrial scenario levels. A residential land use restriction has already been proposed and implemented for the Planned Industrial / Office Development (PID) Area at the Seneca Army Depot. Based on the PAH results found at SEAD-121I, the Army will proposed to maintain the identified institutional control at the PID Area.

#### **Comment:**

**Section 6.2.2 - Fate and Transport** - The section identifies if contaminant levels exceed TAGM values in a variety of media. As this part of the RI is addressing the risk assessment, which uses the Region IX PRGs for screening criteria, it is more applicable to report the number of compounds that exceeded the respective screening criteria.

**Response:** The Army screened SEAD-121C and SEAD-121I contaminant levels in ditch soil and soil against the Region IX Residential PRGs and the contaminant levels in groundwater and surface water versus the Region IX tap water PRGs. The approach applied by the Army is consistent with the approach documented by Chuck Nace of USEPA, Region II in his memorandum, dated November 8, 2004, related to human health risk assessment at SEAD-13. Tables 6-2 and 6-3 show the maximum concentrations detected and whether that value exceeded the PRG screening value for SEAD-121C and SEAD-121I, respectively.

The Army will update and modify the discussion presented in Section 6.2.2 to provide more discussion about the number of compounds identified in each media that exceed PRG screening levels.

# **Comment:**

**Page 6-5, first paragraph** - In this paragraph it is indicated that volatilization of metals from soil is not considered a realistic mechanism for pollutant migration. While generally true, there are some metals,

such as mercury, that can volatilize and migrate through the air. Suggest changing the sentence to say "For example, generally volatilization of metals from soil...." In addition, rationale is provided that indicates that leaching is a potential mechanism for metal transport, but it does not mention of the metals detected at the site were looked at from a leaching perspective (i.e., TLP analysis). Please include this information if the TLP analysis was conducted.

**Response:** The suggested wording will be used in the document for volatilization. Toxicity Characteristic Leaching Procedure (TCLP) analyses were not performed by the Army.

## **Comment:**

**Page 6-5, last paragraph** - Please clarify the purpose and use of the earthen bottomed, storage cells that are located on SEAD-121C.

**Response:** The DRMO Yard (SEAD-121C) at SEDA is inactive, and has been since the Depot closed in 2000. During its active period of operation, the DRMO received and screened all property (including hazardous property) turned in by military services for reutilization and reuse. No records have been identified that detail what materials were stored for what period of time at discrete areas of the DRMO. Based on information provided by USACE personnel remaining at the SEDA, materials stored within the DRMO Yard varied as government equipment and property was identified as surplus and sent for final disposition.

The Army and Parsons provided a detailed description of the materials that were found at various areas within the DRMO Yard in Section 1.3 of the Draft Final Remedial Investigation Report. As was stated in Section 1.3:

During site visits in 2002, 2003, and 2004, Parsons observed that scrap metal, military items, and old machines were stored in the earthen bottomed storage cell located along the northwest fence, while the ladle-shaped earthen bottomed cell was empty, except for small quantities of metal shavings.

At the time the DRMO Yard was last viewed by Parsons, the site was inactive. Parsons understands that the USACE has recently contracted to remove all remaining debris from the site.

#### **Comment:**

**Page 6-9** - For several exposure pathways, the subsurface soil is identified as being 2-6 feet in depth. Typically, Region 2 uses 2-10 feet depths to assess the potential risks and hazards from exposure to subsurface soil. It appears that the water table and bedrock are approximately 6 feet in depth, which is

why those depths were used. If this is the case, please clarify this in the text so that the discrepancy from the typical subsurface soil depth is documented and justified.

**Response:** During field activities completed as part of the ESI and the RI, the deepest soil interval sampled and analyzed was from 2 ft. to 6 ft bgs. Bedrock was generally encountered at approximately 6 ft. bgs. Therefore, references to 2-6 feet in depth are specific to SEAD-121C, and the text will be revised accordingly.

## **Comment:**

**Page 6-17, Section 6.4** - It is indicated that the maximum detected concentrations were screened against the USEPA Region IX PRGs that correspond to a hazard quotient of 1. Region 2 screens against the USEPA Region IX PRGs that correspond to a hazard quotient of 0.1.

**Response:** To incorporate the above procedures, the COPC screening was repeated using the residential Region IX PRGs corresponding to either a hazard quotient of 0.1 or a cancer risk of 10<sup>-6</sup>. As shown in the table below, several additional COPCs (mainly metals) are identified using the requested approach.

Additional COPCs By Using 0.1 PRGs for PRGs Based on Non-Carcinogenic Effects

| Medium                          | SEAD-121C  | SEAD-121I   |
|---------------------------------|--|---|
| Soil<br>(Surface/Total<br>Soil) | Aluminum, Barium,<br>Cadmium, Manganese,<br>Nickel, Thallium Vanadium,<br>Zinc | Aluminum, Antimony,<br>Cadmium, Cobalt, Nickel,<br>Selenium |
| Ditch Soil                      | Aluminum, Antimony,<br>Cadmium, Copper,<br>Manganese, Vanadium                 | Aluminum, Cobalt,<br>Vanadium                               |
| Groundwater                     | Antimony, Chromium,<br>Manganese   | NA  |
| Surface<br>Water                | Aluminum, Barium, Copper,<br>Mercury, Nickel, Zinc                             | Iron, Lead, Manganese,<br>Vanadium                          |

The risk assessment was repeated including all COPCs identified using this screening approach and the risk results in general confirm the conclusions presented in the previous report. Detailed discussion of the revised risk results is presented in Appendix I, Attachment 1 and 2.

## **Comment:**

**Page 6-20, last paragraph** - Please clarify why groundwater risks associated with SEAD-27 were included in this risk assessment. If there were no contaminants of potential concern associated with groundwater at SEAD-121C, then the assessment would be ended for groundwater at SEAD-121C. This issue is also raised on page 6-31 and 6-47.

## **Response:**

The Steam Cleaning Waste Tank at Building 360 (SEAD-27) abuts the eastern boundary of the DRMO Yard (SEAD-121C). The groundwater at SEAD-27 subsequently flows into SEAD-121C. One of the two monitoring wells (i.e., MW-2) installed to assess the possible release of contaminants from the Steam Cleaning Waste Tank (SEAD-27) is located within the DRMO Yard, and was sampled as part of the SEAD-121C investigation.

Groundwater contamination has been identified at SEAD-27, focused in the groundwater upgradient and beneath the building. As a result of the identified contamination, a groundwater use restriction was implemented at the site, and serves as the basis of the overall groundwater use restriction that the Army has proposed and implemented for the Planned Industrial/Office Development (PID) Area as a whole.

Temporary wells located in SEAD-121C for the preliminary Environmental Baseline Survey investigations conducted in 1998 showed several of the same contaminants as were found in the SEAD-27 groundwater wells. Permanent wells installed at SEAD-121C for the remedial investigation did not show the same contaminants. Therefore, the Army chose to provide a discussion of the SEAD-27 groundwater data to provide insight into upgradient sources that may impact the DRMO Yard in the future.

## **Comment:**

**Page 6-23, third paragraph** - Please provide additional details that explain why an exposure duration of 14 days was chosen for the adolescent trespasser. As the summer months, when children are not in school, would appear to be prime timing for adolescents to trespass, the exposure duration may need to be increased.

**Response:** USEPA guidance documents on human health risk assessments do not recommend a specific value for the exposure for an adolescent trespasser. The 14 days/year exposure frequency was selected based on best professional judgment and site-specific conditions. The Depot is situated in a sparsely populated rural area; it is fenced to limit access and is occasionally patrolled by site security personnel. The setting of SEAD-121C/121I is generally similar to the surrounding areas and there are no areas that may attract special attentions from potential adolescent trespassers. Therefore, trespassing at the sites is considered unlikely to occur frequently or for extended periods without individuals being challenged or

noticed. On this basis, a 14 days/year exposure frequency is considered a reasonable assumption for the sites. Nonetheless, an elevated exposure frequency (50 days/year) was evaluated and this evaluation indicates that no unacceptable risks are expected for SEAD-121C/121I. Although elevated non-cancer risk was observed at SEAD-121C for the trespasser, the elevated hazard index is mainly caused by manganese in soil.

#### **Comment:**

**Page 6-34, Section 6.5.3.7, first paragraph** - It is indicated that the adult lead model is based on the assumption of continuing long term exposure and that the risk for short-term exposure was not estimated. However, as stated, the adult lead model protects the developing fetus and as the fetus is the most sensitive receptor, which is at most 10 months of age prior to birth, the short-term exposure to a construction worker should be included in the risk assessment. This is also referenced on page 6-42.

**Response:** The Army does not see the need to include a short-term exposure for lead to a construction worker in the risk assessment conducted for the DRMO Yard (SEAD-121C). Although a few of the surficial soil samples collected from the area exhibit elevated concentrations of lead, the overall average value for lead found in soil from the former DRMO Yard is 735 mg/Kg, which is below the Region IX Industrial PRG. Similarly, the overall site average is lower that the state of New York's recently proposed restricted commercial and restricted industrial exposure levels for lead at brownfield site (1,000 and 3,900 mg/Kg, respectively). The DRMO Yard is located in within the PID Area at the SEDA, in an area that the Army has already imposed a use restriction prohibiting the use of the land for any residential purpose.

## **Comment:**

**Page 6-46, second paragraph** - The guidance that is referenced does present a revised approach for assessing carcinogenicity of mutagenic chemicals, however, the agency is still developing a plan for the implementation of the guidance as it relates to CERCLA risk assessments. The approach that was used is one option, however, it may not be the preferred option, thus please note that a different methodology may be required for future risk assessments.

**Page 6-48, first paragraph** - This describes the strategic stockpiles of ferrous-manganese ore that are staged on SEAD-121I. The legal interpretation of the stockpiles (i.e., if they are CERCLA regulated wastes or not) was stated within the General Comments section above.

**Response:** See the first part of the response to General Comments above.

# Army's Response to Comments from the New York State Department of Environmental Conservation

Subject: Draft Final Remedial Investigation Report SEAD-121C and SEAD-121I Seneca Army Depot Romulus, New York

Comments Dated: January 30, 2006

Date of Comment Response: April 27, 2006

# **Army's Response to Comments**

## **SPECIFIC COMMENTS**

Comment 1: Section E.1.1, Page E-2

The statement shows the presence of the elevated level of Heavy Metals in the Surface Soil – FS report will need to address it.

# **Response 1:**

Disagree. The Army does not agree with the NYSDEC's direction that a feasibility study is needed to assess the possible remedial actions for SEADs 121C (the DRMO Yard) and 121I (the Rumored Cosmoline Oil Disposal Area). Both of these sites are located in the portion of the former Depot where the designated future land use is Planned Industrial / Office Development (PID). Due to prior decisions made and formally documented by all parties involved with the continuing closure of sites at the former Depot, institutional controls (ICs) prohibiting access to and use of groundwater, and use of the land within the PID area for residential purposes has been imposed on this area. The residential use restriction includes prohibiting the development and use of property for residential housing, elementary and secondary schools, child care facilities and playgrounds.

The results of the remedial investigation (RI) performed in these two areas, and discussed in the RI Report reviewed, confirm that contamination is present at locations within each of the sites. Generally, all computed industrial scenario human health risk levels are consistent with EPA's referenced ranges (HIs = 1 or less and cancer risks in range of 1E-04 to 1E-06 or less), with the exceptions of HIs computed for industrial and construction workers at SEAD-121I. The elevated HIs at SEAD-121I result primarily from manganese and are directly associated with the United States' continuing storage of strategic ferro-manganese ore piles in this area. Residues that remain once the strategic stockpiles are removed will be addressed by the authority responsible for their management.

The Army also acknowledges that chemical concentrations found at the two sites will preclude the future use of these two former solid waste management units for residential purposes without some remedial action. However, this is not considered to be an onerous restriction because the overall site is classified as an area where the most probable future land use is industrial / office development, and there are other areas in close proximity of these sites where necessary residential like (e.g., day care center, school, playground, and housing activities can be performed).

Therefore, the Army sees no reason to or benefit from preparing a feasibility study (FS) to assess potential remedial actions for either site. Its proposed path is to recommend that the area-wide groundwater use restriction remain in place in these areas, and that neither of these sites be used for residential purposes

Army's Response to NYSDEC Comments on Draft Final RI Report SEAD-121C and SEAD-121I Comments Dated January 30, 2006 Page 2 of 2

including residential housing, elementary and secondary schools, child care facilities and playgrounds. The Army reiterates that the groundwater restriction is not a punitive restriction because a distribution system is present throughout the PID area for potable water, and this system can be tapped to provide water that may be needed. The Army also does not believe that the residential use restriction is punitive, given the local redevelopment authorities decision to use this area for industrial/commercial purposes.

The CERCLA process does not mandate that a FS be completed for all sites, especially given the obvious remedial alternative option that exists for these sites. The Army proposes that the CERCLA process move forward to the preparation, review and approval of necessary proposed plans and records of decisions for these two sites, as are described above. In fact this exact path forward was used at other sites (SEAD-27, SEAD-64A, and SEAD-66) in the PID area at SEDA, and approved by the EPA with concurrence from the NYSDEC in September 2004.

## **Comment 2:** Section E.2.1, Page E-5

The statement shows the presence of elevated level of Iron and Manganese concentrations in the soil around the areas surrounding the two ferrous-manganese ore piles. Issue will need to be addressed in FS.

## **Response 2:**

See Response to Comment 1.

# **Comment 3:** Section 8.2, Page 8-1

DEC does not agree with the Recommendations from Remedial Investigation that "...the army recommends that these restrictions remain in effect for SEAD-121C and SEAD-121I until additional data is developed and evaluated to substantiate their removal at either or both of the sites" without specifying a time frame. When will the restrictions be removed? Specify that it will be at the time that the strategic piles are removed from SEAD-121I? Or is it at the time the historic stockpiling activities will be addressed by the DoD through the authority responsible for management of the piles (see Section 5.2.3, Page 5-11). Please clarify this further in your recommendations.

# **Response 3:**

The need for the continuance of the proposed ICs will be reviewed at five year intervals, consistent with the requirements of CERCLA, once the proposed plan and ROD are finalized. At this time, the Army does not anticipate collecting more data for the former DRMO Yard (SEAD-121C) because there is no industrial scenario human health risk defined, and a land use restriction is proposed for implementation in this area. Additional data will be collected in the area of the ferro-manganese ore stockpiles once the strategic reserves are used or moved. The Army currently does not have a timetable defined for removal of these piles.

**Comment 4:** The DEC ecological section reviewed the document and the data and agrees with the conclusions in perspective to move forward to the feasibility study. Please provide a hard copy of the draft final RI report for ecological section, to this office before we review the FS.

## **Response 4:**

The Army does not anticipate preparing a FS for these sites, as per discussions above. A copy of the RI will be forwarded to the NYSDEC per its request.

# APPENDIX I

# QUANTITATIVE UNCERTAINTY ANALYSIS FOR BASELINE HUMAN HEALTH RISK ASSESSMENT SEAD-121C AND SEAD-121I

# Appendix I, Attachment 1 Quantitative Uncertainty Analysis for Baseline Human Health Risk Assessment SEAD-121C and SEAD-121I

A risk assessment was re-performed for SEAD-121C and SEAD-121I under the RME scenario with the revised COPC screening protocol to evaluate potential uncertainty to the human health risk assessment. The COPC screening presented in the RI report was conducted by comparing the maximum detected concentrations with Region 9 PRGs corresponding to a target cancer risk of  $1 \times 10^{-6}$  or a target hazard quotient of 1, whichever is lower. To incorporate procedures requested in the USEPA comment letter dated 10/31/05, the COPC screening was revised by using Region 9 PRGs corresponding to a target cancer risk of  $1 \times 10^{-6}$  or a target hazard quotient of 0.1, whichever is lower. As shown in the table below, several additional COPCs (all metals) were identified using the revised approach.

Additional COPCs By Using 0.1PRGs for PRGs Based on Non-Carcinogenic Effects

| Medium                          | SEAD-121C  | SEAD-121I   |
|---------------------------------|--|---|
| Soil<br>(Surface/Total<br>Soil) | Aluminum, Barium,<br>Cadmium, Manganese,<br>Nickel, Thallium Vanadium,<br>Zinc | Aluminum, Antimony,<br>Cadmium, Cobalt, Nickel,<br>Selenium |
| Ditch Soil                      | Aluminum, Antimony,<br>Cadmium, Copper,<br>Manganese, Vanadium                 | Aluminum, Cobalt,<br>Vanadium                               |
| Groundwater                     | Antimony, Chromium,<br>Manganese   | NA  |
| Surface<br>Water                | Aluminum, Barium, Copper,<br>Mercury, Nickel, Zinc                             | Iron, Lead, Manganese,<br>Vanadium                          |

The risk calculation sheets are presented in **Attachment 2 Table 1A** through **Table 10G** and the risk results are summarized in **Table 11A** and **Table 11B** of **Attachment 2** for SEAD-121C and SEAD-121I, respectively. This section presents a discussion of the risk results and potential impact to the human health risk assessment conclusion caused by the above revision.

## 1 Quantitative Uncertainty Analysis Results Summary

**Section 1.1** and **Section 1.2** summarize quantitative uncertainty analysis results for SEAD-121C and SEAD-121I, respectively.

# 1.1 SEAD-121C Quantitative Uncertainty Analysis Results Summary

The cancer risks resulted from the revised COPC screening approach for all receptors based on the RME scenario are below the USEPA upper limit of  $1x10^{-4}$ . These results are summarized in **Table 11A.** 

The total non-cancer hazard indices based on the RME for the industrial worker and adolescent trespasser receptors are below the USEPA target limit of 1. The non-cancer hazard index for the construction worker exposed to soil and groundwater is 9 and the non-cancer hazard index for the construction worker exposed to ditch soil, surface water, and groundwater is 3.

With respect to the construction worker exposed to soil and groundwater, the potential non-cancer risks due to the inhalation of dust caused by construction activities, soil ingestion, and groundwater intake contribute 86%, 10%, and 4%, respectively, to the total non-cancer risk. Aluminum and manganese levels found in SEAD-121C soil contribute more than 98% to the non-cancer risk associated with inhalation of dust. Aluminum, iron, and manganese in SEAD-121C soil contribute more than 45% to the non-cancer risk associated with soil ingestion. However, the aluminum, iron, and manganese concentrations found in SEAD-121C soil are consistent with the Seneca background levels, as is discussed in **Section 2**. Further, the Army has proposed institutional controls in the form of a residential activity land use restriction, and access to or use of groundwater until Class GA Groundwater Standards are met on the PID parcel (including SEAD-121C and SEAD-121I). If non-cancer contributions from background concentrations of metals in soil were not included in the total risk, and with the imposition of the groundwater use restriction, the total non-cancer risk for the construction worker exposed to soil and groundwater at SEAD-121C would be below the USEPA limit of 1.

With reference to the construction worker exposed to ditch soil, surface water, and groundwater, the non-cancer risks associated with inhalation of dust caused by construction activities, ditch soil ingestion, and groundwater intake contribute 58%, 27%, and 13%, respectively, to the total non-cancer risk. Identified concentrations of aluminum and manganese in SEAD-121C ditch soil contribute more than 99% to the non-cancer risk associated with inhalation of dust in ambient air. Further, identified concentrations of aluminum, iron, and manganese in SEAD-121C ditch soil contribute more than 61% to the non-cancer risk associated with ditch soil ingestion. However, as discussed in **Section 2**, aluminum, iron, and manganese in SEAD-121C ditch soil are consistent with the Seneca soil background levels. Further, the Army has proposed institutional controls in the form of a residential activity land use restriction, and access to or use of groundwater until Class GA Groundwater Standards are met on the PID parcel (including SEAD-121C and SEAD-121I). Again, if the non-cancer contributions from background concentrations were not included in the total risk, and with the groundwater use/access restriction in place, the total non-cancer risk for the construction worker exposed to ditch soil, surface water, and groundwater at SEAD-121C would be below the USEPA limit of 1.

# 1.2 SEAD-121I Quantitative Uncertainty Analysis Results Summary

The cancer risks resulted from the revised COPC screening approach for all receptors based on the RME scenario are below the USEPA upper limit of  $1x10^{-4}$ . These results are summarized in **Table 11B.** 

The total non-cancer hazard indices based on the RME for the adolescent trespasser are below the USEPA target limit of 1. The non-cancer hazard indices for the industrial worker exposed to SEAD-121I soil and SEAD-121I ditch soil are approximately 30 and 4, respectively. The non-cancer hazard indices for the construction worker exposed to SEAD-121I soil and construction workers exposed to SEAD-121I ditch soil and surface water are approximately 200 and 30, respectively.

For the industrial worker exposed to SEAD-121I soil, the non-cancer risks associated with inhalation of dust, soil ingestion, and dermal soil contact contribute 82%, 16%, and 2%, respectively, to the total non-cancer risk. **Table 12** indicates that concentrations of manganese in SEAD-121I soil contribute almost 100% to the non-cancer risk that results from the inhalation of dust in ambient air. In addition, soil concentrations of manganese contribute approximately 95% and 97% to the non-cancer risks associated with soil ingestion and soil dermal contact, respectively.

With reference to the industrial worker exposed to ditch soil, the non-cancer risks associated with inhalation of dust, ditch soil ingestion, and dermal ditch soil contact contribute 93%, 6%, and 1%, respectively, to the total non-cancer risk. Again **Table 12** indicates that manganese in SEAD-121I ditch soil contributes approximately 98% to the non-cancer risk associated with inhalation of dust in ambient air. As discussed in Section 6.9.2 of the RI report, the levels of manganese detected at SEAD-121I are directly associated with the ferro-manganese ore piles that are present at the site, and which are also part of the United State's strategic stockpile of raw materials. When the Strategic Stockpiles are removed, residues associated with the historic stockpiling activities will be addressed by the DoD through the authority responsible for management of the piles. Therefore, manganese is not considered a COC at SEAD-121I. If manganese were not included in the risk assessment, the total non-cancer and cancer risks for the industrial worker would be below the USEPA target limits.

Similar results are found for the construction worker. For the construction worker exposed to SEAD-121I soil, the non-cancer risks associated with inhalation of dust, soil ingestion, and dermal soil contact contribute 91%, 9%, and 1%, respectively, to the total non-cancer risk. Again **Table 12** shows that manganese in SEAD-121I soil contributes almost 100% to the non-cancer risk associated with inhalation of dust in ambient air caused by construction activities. In

addition, manganese in SEAD-121I soil contributes approximately 95% and 97% to the non-cancer risks associated with soil ingestion and soil dermal contact, respectively.

With reference to the construction worker exposed to ditch soil and surface water, the non-cancer risks associated with inhalation of dust, ditch soil ingestion, and dermal ditch soil contact contribute 85%, 14%, and 1%, respectively, to the total non-cancer risk. Review of **Table 12** again indicates that concentrations of manganese in SEAD-121I ditch soil contribute approximately 98%, 56%, and 59% to the non-cancer risk associated with inhalation of dust, ditch soil ingestion, and ditch soil dermal contact, respectively. The iron concentrations in SEAD-121I ditch soil contribute approximately 9% to the non-cancer risk via ditch soil ingestion. In addition, the arsenic concentrations in SEAD-121I ditch soil contribute 30% to the non-cancer risk via ditch soil ingestion. The levels of manganese and iron detected at SEAD-121I are associated with strategic materials and therefore neither manganese nor iron is considered a COC at SEAD-121I. For arsenic in ditch soil, as discussed in **Section 2** below, there is no evidence that the levels in SEAD-121I ditch soil are significantly higher than the background levels in Seneca soil. If manganese in SEAD-121I soil and ditch soil and arsenic and iron in SEAD-121I ditch soil were not included in the risk assessment, the total non-cancer and cancer risks for all receptors would be below the USEPA target limits.

# 2 Background Comparison

As discussed in the previous section, aluminum, iron, and manganese in SEAD-121C soil and ditch soil resulted in non-cancer risks for potential construction workers exceeding the USEPA limit of 1. Arsenic in SEAD-121I ditch soil contributed significantly to the elevated risks for potential construction workers. This section presents a comparison of the Seneca background levels with the aluminum, iron, and manganese concentrations in SEAD-121C soil and ditch soil and with the arsenic concentrations in SEAD-121I ditch soil. Information of Seneca background data is presented in Section 6.3.2 of the RI report and the data are presented in Appendix D of the report.

Summary descriptive statistics are presented in **Table 13** that compare aluminum, iron, and manganese concentrations found in SEAD-121C soil and ditch soil with Seneca soil background, and in **Table 14** that compare arsenic concentrations measured in SEAD-121I ditch soil with Seneca soil background.

Review of **Table 13** shows that the four descriptive statistics parameters (i.e., maximum, minimum, arithmetic mean, and 95% UCL) computed for aluminum and manganese in SEAD-121C soil are all below or close to the corresponding statistics computed for these parameters for Seneca background. For iron in SEAD-121C soil, the maximum concentration is above the maximum level detected in Seneca background (54,100 mg/kg vs. 38,600 mg/kg); however, the

other three descriptive statistics parameters are below or close to the corresponding statistics parameters for Seneca background.

Comparably, for aluminum, iron, and manganese in SEAD-121C ditch soil, the four descriptive statistics parameters (i.e., maximum, minimum, arithmetic mean, and 95% UCL) are all below or close to the corresponding statistics parameters for Seneca background.

Results presented in **Table 14** for arsenic in SEAD-121I ditch soil show that the maximum concentration measured for arsenic in SEAD-121I ditch soil was 104 mg/kg, found at location SD121I-8, collocated with the maximum manganese concentration. The next highest level of arsenic observed in SEAD-121I ditch soil was 27.4 mg/kg, which is close to the maximum arsenic level observed in the background data set. The other three descriptive statistics parameters are elevated for arsenic in SEAD-121I ditch soil when compared with Seneca soil background. However, further statistical tests, as discussed below, do not demonstrate significant difference between the SEAD-121I ditch soil data set and the Seneca soil background data set.

In addition to the descriptive statistics comparison, both non-parametric (Mann-Whitney T test) and parametric (Student's T test) statistical test methods were used for the background comparison analysis. One-tailed (one-sided) or two-tailed (two-sided) Mann-Whitney tests and Student's T tests were conducted for the data using XLSTAT (Version 2006.2). Both tests assumed 0.05 as the significance level. The statistical test results are presented in **Table 15A** through **Table 21C**. It should be noted that although the Student's T test is based on normal distribution assumption, USEPA (2002c) recommends the use of Student's T Test if a larger number of data points are available (n > 25) and indicates that the parametric test will work well when the sample size is large.

The SEAD-121C soil data sets for aluminum, iron, and manganese and the Seneca background data sets for aluminum, arsenic, iron, and manganese all have more than 50 data points; therefore, the Student's T tests should perform sufficiently for the background comparison. The SEAD-121C ditch soil data sets for aluminum, iron, and manganese and the SEAD-121I ditch soil data set for arsenic have limited sample size ( $n \le 10$ ) and ultimately the power of the test (or chance to detect the difference between the two data sets) would be relatively low.

As shown in **Table 15A** through **Table 21C**, the results from the Student's T tests are consistent with the Mann-Whitney test results with the following exceptions.

- For manganese in SEAD-121C ditch soil, the Student's T test would reject the null hypothesis (the mean of the SEAD-121C ditch soil data is not significantly different from the mean of Seneca background) and accept the alternative hypothesis (the mean of the SEAD-121C ditch soil data is significantly smaller than the mean of Seneca background). The Man-Whitney test would accept the null hypothesis.
- For arsenic in SEAD-121I ditch soil, the Student's T test would accept the null hypothesis (the mean of the SEAD-121I ditch soil data is not significantly different from the mean of

Seneca background) while the Man-Whitney test would reject the null hypothesis and accept the alternative hypothesis (the mean of the SEAD-121I ditch soil data is significantly different from the mean of Seneca background) for arsenic. However, when the alternative hypothesis was revised to reflect that the mean of the SEAD-121I ditch soil data is significantly greater than the mean of Seneca background, the Man-Whitney test accepts the null hypothesis (the mean of the SEAD-121I ditch soil data is not significantly different from the mean of Seneca background).

In summary, although the two tests provide contradictory conclusions for the hypothesis tests, for both cases, the two tests indicate the same conclusion that the site data are not statistically above Seneca background. In brief, both the Student's T test and the Mann-Whitney test conclude that

- Aluminum, iron, and manganese in SEAD-121C soil is consistent with or below Seneca soil background,
- Aluminum, iron, and manganese in SEAD-121C ditch soil is consistent with or below Seneca soil background, and
- Arsenic levels in SEAD-121I ditch soil are not statistically above Seneca soil background.

# 3 Adolescent Trespasser Exposure Frequency Uncertainty Analysis

Table 9A through Table 10G present the risk calculation for an adolescent trespasser (ages 11-16 yr) with exposure to contaminants in SEAD-121C and SEAD-121I impacted mediums for an exposure frequency of 14 days/year. The 14 days/year exposure frequency was selected based on best professional judgment and knowledge of site-specific conditions. The Depot is situated in a sparsely populated rural area; it is fenced to limit access and is occasionally patrolled by site security personnel. SEAD-121C and SEAD-121I are both located in close proximity to the Army's current office locations, and both are typified as relatively open and generally flat. Further, the setting of SEAD-121C/121I is generally similar to the surrounding areas and there are no specific features (e.g., vehicles, buildings, towers, culverts, etc.) that would attract special attention from potential adolescent trespassers. Therefore, trespassing at SEAD-121C/121I is considered unlikely to occur frequently or for extended periods without individuals being challenged or noticed. On this basis, a 14 days/year exposure frequency is considered a reasonable assumption for the sites. Nonetheless, an elevated exposure frequency, 50 days/year (equivalent to two days a week for 25 weeks or approximately half a year), was evaluated for the uncertainty analysis.

The risks (including total cancer risk and non-cancer hazard index) are in linear relationship with the exposure frequency for the adolescent trespasser (as illustrated in the generic intake equation presented in Section 6.5.3 of the RI report, along with the risk characterization equation presented in Section 6.7 of the RI report; specific equations for each exposure pathway are also presented in the risk calculation sheets presented in Appendix G of the RI report). Therefore, the risks for the adolescent receptor with an exposure frequency of 50 days/year can be easily inferred from the

risks associated with 14 days/year exposure frequency (as presented in **Tables 9A** through **10G**) and are summarized in **Table 22**.

As shown in **Table 22**, the total cancer risks and non-cancer risks for the adolescent trespasser with an exposure frequency of 50 days/year at SEAD-121C are below the USEPA limits (1E-4 for cancer risk and 1 for hazard index).

The total cancer risk and non-cancer risk for the adolescent trespasser exposed to COPCs in SEAD-121I ditch soil and surface water with an exposure frequency of 50 days/year are below the USEPA limits (**Table 22**).

The total cancer risk for the adolescent trespasser exposed to COPCs in SEAD-121I soil with an exposure frequency of 50 days/year is below the USEPA limit. The hazard index for the adolescent trespasser exposed to COPCs in SEAD-121I soil with an exposure frequency of 50 days/year is slightly above the USEPA limit (2 vs. 1). The elevated hazard index is mainly caused by manganese in SEAD-121I soil, which contributes 100%, 95%, and 97% respectively to the ambient air inhalation, soil ingestion, and soil dermal contract exposure pathways. As discussed in **Section 1**, the levels of manganese detected at SEAD-121I are associated with strategic materials and therefore manganese is not considered a COC at SEAD-121I. If manganese in SEAD-121I soil were not included in the risk assessment, the total non-cancer and cancer risks for the adolescent trespasser with an exposure frequency of 50 days/year would be below the USEPA target limits.

In summary, the 14 days/year exposure frequency used for this risk assessment was a reasonable and conservative assumption based on the site-specific conditions and uses. However, even if an elevated exposure frequency (50 days/year) were applied, there would be no unacceptable risks to the adolescent trespasser at SEAD-121C or SEAD-121I once the strategic materials at SEAD-121I are removed and their associated residues are addressed.

# 4 Quantitative Uncertainty Analysis Conclusion

The risk assessment was repeated with the following revised approach/assumptions to evaluate potential uncertainty of the analysis.

- The COPC screening was conducted by comparing the maximum detected concentrations with Region 9 PRGs corresponding to a target cancer risk of 1x10<sup>-6</sup> or a target hazard quotient of 0.1, whichever is lower; and
- Risk assessment was repeated for an elevated exposure frequency of 50 days/year for the adolescent trespasser (ages 11-16 yr).

In summary, the above approach or assumption revisions are not expected to impact the overall

risk assessment conclusions at the sites. Although elevated non-cancer risks were identified for construction workers exposed to COPCs in the impacted mediums at SEAD-121C, the risks were caused by background metal levels at the site and groundwater intake. Elevated non-cancer risks were identified for industrial workers, construction workers, and adolescent trespassers with elevated exposure frequency (i.e., 50 days/year) who may potentially be exposed to COPCs in the impacted mediums at SEAD-121I, the risks were caused by manganese and iron associated with the ore piles and background metal levels at the site. Once the strategic materials at SEAD-121I and their associated residues are removed by the DoD, and with the recommended institutional control (i.e., restriction of groundwater use and access and prohibition of residential housing, school, childcare facility and playground development) in place for the sites, the sites would not pose unacceptable risks to human health.

#### Notes:

- Field duplicates were averaged and regarded as one entry. Half the reporting limits were assumed for non-detects for the average calculation.
   (dup) indicates that the maximum concentration was detected in a duplicate pair. The maximum concentration reported is the average value of the sample and its duplicate. Lab duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
- 2. The maximum detected concentration was used for screening.
- 3. Background value is the maximum detected concentration of the Seneca background dataset.
- 4. EPA Region 9 Preliminary Remediation Goals (PRGs) for residential soil. On-line resources available at

http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated December 2004.

Target Cancer Risk = 1E-6; Target Hazard Quotient = 1. Direct contact exposure (ingestion, dermal contact, and inhalation) is evaluated to derive the PRGs.

PRG for xylenes was used as screening value for meta/para xylenes and ortho xylene.

EPA Region III Risk Based Concentration (RBC) for residential soil was used as screening value for 2-methylnaphthalene

as no Region 9 PRG is available. EPA Region III RBC, available on-line at http://www.epa.gov/reg3hwmd/risk/human/rbc/rbc1004.XLS,

was calculated based on soil ingestion exposure and a target cancer risk of 1E-6 and a target hazard quotient of 1.

The PRGs or RBCs corresponding to a hazard quotient of 1 were adjusted by multiplying 0.1 before they were used as screening values.

PRG for Aroclor 1254 was used as screening value for Aroclor 1260.

PRG for gamma-chlordane was used as screening value for alpha-chlordane.

PRG for alpha-BHC was used as screening value for delta-BHC.

PRG for endosulfan was used as screening value for endosulfan I and endosulfan II.

PRG for endrin was used as screening value for endrin ketone.

Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 200 mg/day soil ingestion

and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium)

from Marilyn Wright (2001) Dietary Reference Intakes.

PRG for total chromium (1:6 ratio Cr VI: Cr III) was used as screening value for chromium.

PRG for nickel (soluble salts) was used as screening value for nickel.

5. Potential TBC values are from NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046. No ARARs were identified. (on-line resources available at http://www.dec.state.ny.us/website/der/tagms/prtg4046.html)

6. Rationale codes Selection Reason:

election Reason: Above Screening Levels (ASL)
Chemicals in the Same Group were retained as COPC (CSG)

Deletion Reason: Essential Nutrient (NUT)
Below Screening Level (BSL)

No Screening Value or Toxicity Value (NSV)

No Screening Value or Toxicity Value (NS)

Individual Chemicals Evaluated (ICE)

Definitions: COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

Q = Qualifier

J = Estimated Value

NJ = Presence of the analyte has been "tentatively identified" and the associated numerical value represents its approximate concentration.

#### Notes:

- 1. Field duplicates were averaged and regarded as one entry. Half the reporting limits were assumed for non-detects for the average calculation. Lab duplicates were not included in the assessment. (dup) indicates that the maximum concentration was detected in a duplicate pair. The maximum concentration reported is the average value of the sample and its duplicate. Range of reporting limits were presented for nondetects only.
- 4. EPA Region 9 Preliminary Remediation Goals (PRGs) for residential soil. On-line resources available at

http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated December 2004.

Target Cancer Risk = 1E-6; Target Hazard Quotient =1. Direct contact exposure (ingestion, dermal contact, and inhalation) is evaluated to derive the PRGs.

PRG for xylenes was used as screening value for meta/para xylenes and ortho xylene.

EPA Region III Risk Based Concentration (RBC) for residential soil was used as screening value for 2-methylnaphthalene

as no Region 9 PRG is available. EPA Region III RBC, available on-line at http://www.epa.gov/reg3hwmd/risk/human/rbc/rbc1004.XLS,

was calculated based on soil ingestion exposure and a target cancer risk of 1E-6 and a target hazard quotient of 1.

The PRGs or RBCs corresponding to a hazard quotient of 1 were adjusted by multiplying 0.1 before they were used as screening values.

PRG for Aroclor 1254 was used as screening value for Aroclor 1260.

PRG for gamma-chlordane was used as screening value for alpha-chlordane.

PRG for alpha-BHC was used as screening value for delta-BHC.

PRG for endosulfan was used as screening value for endosulfan I, endosulfan II, and endosulfan sulfate.

PRG for endrin was used as screening value for endrin aldehyde and endrin ketone.

Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 200 mg/day soil ingestion

and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and

minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium)

from Marilyn Wright (2001) Dietary Reference Intakes.

PRG for total chromium (1:6 ratio Cr VI: Cr III) was used as screening value for chromium.

PRG for nickel (soluble salts) was used as screening value for nickel.

5. Potential TBC values are from NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046. No ARARs were identified.

(on-line resources available at http://www.dec.state.ny.us/website/der/tagms/prtg4046.html) 6. Rationale codes

Selection Reason: Above Screening Levels (ASL)

Chemicals in the Same Group were retained as COPC (CSG)

Deletion Reason: Essential Nutrient (NUT)

Below Screening Level (BSL) No Screening Value or Toxicity Value (NSV)

Individual Chemicals Evaluated (ICE)

**Definitions**: COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

O = Qualifier J = Estimated Value

NJ = Presence of the analyte has been "tentatively identified" and the associated numerical value represents its approximate concentration.

#### Notes:

- Field duplicates were averaged and regarded as one entry. Half the reporting limits were assumed for non-detects for the average calculation.
   (dup) indicates that the maximum concentration was detected in a duplicate pair. The maximum concentration reported is the average value of the sample and its duplicate. Lab duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
- 2. The maximum detected concentration was used for screening.
- 3. Background value is the maximum detected concentration of the Seneca background dataset.
- 4. EPA Region 9 Preliminary Remediation Goals (PRGs) for residential soil. On-line resources available at

http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated October 2004.

Target Cancer Risk = 1E-6; Target Hazard Quotient =1, Direct contact exposure (ingestion, dermal contact, and inhalation) is evaluated to derive the PRGs.

EPA Region III Risk Based Concentration (RBC) for residential soil was used as screening value for 2-methylnaphthalene

as no Region 9 PRG is available. EPA Region III RBC, available on-line at http://www.epa.gov/reg3hwmd/risk/human/rbc/rbc1004.XLS,

was calculated based on soil ingestion exposure and a target cancer risk of 1E-6 and a target hazard quotient of 1.

The PRGs or RBCs corresponding to a hazard quotient of 1 were adjusted by multiplying 0.1 before they were used as screening values.

Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 200 mg/day soil ingestion

and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and

minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium)

from Marilyn Wright (2001) Dietary Reference Intakes.

PRG for total chromium (1:6 ratio Cr VI: Cr III) was used as screening value for chromium.

PRG for cyanide hydrogen was used as screening value for amenable cyanide and total cyanide.

PRG for nickel (soluble salts) was used as screening value for nickel.

5. Potential TBC values are from NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046. No ARARs were identified. (on-line resources available at http://www.dec.state.ny.us/website/der/tagms/prtg4046.html)

6. Rationale codes

Selection Reason:

Above Screening Levels (ASL)

Chemicals in the Same Group were retained as COPC (CSG)

Deletion Reason:

Essential Nutrient (NUT)
Below Screening Level (BSL)

No Screening Value or Toxicity Value (NSV)

Individual Chemicals Evaluated (ICE)

Definitions:

COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

Q = Qualifier

J = Estimated Value

#### Table 1D

# OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN IN SEAD-121C GROUNDWATER SEAD-121C

#### Notes:

- 1. Field duplicates were averaged and regarded as one entry. Half the reporting limits were assumed for non-detects for the average calculation. Lab duplicates were not included in the assessment. (dup) indicates that the maximum concentration was detected in a duplicate pair. The maximum concentration reported is the average value of the sample and its duplicate. Range of reporting limits were presented for nondetects only. To ensure a reliable dataset, only groundwater samples at the DRMO Yard collected from permanent wells using low flow sampling techniques were included in the screeing process.
- 2. The maximum detected concentration was used for screening.
- 3. EPA Region 9 Preliminary Remediation Goals (PRGs) for tap water. On-line resources available at http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated December 2004.

  Target Cancer Risk = 1E-6: Target Hazard Quotient = 1. Ingestion from drinking and inhalation of volatiles during showering are evaluated to derive the PRGs.

The PRGs corresponding to a hazard quotient of I was adjusted by multiplying 0.1 before they were used as screening values.

MCL for lead was used as screening value for lead as no Region 9 PRG is available.

Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 2L/day water intake and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 2-5 yr children (1400 mg/day for potassium) from Marilyn Wright (2001) Dietary Reference Intakes. For sodium, an upper limit intake of 2,400 mg/day (http://www.mealformation.com/dailyval.html) was used.

PRG for chromium (VI) was used as screening value for chromium.

4. ARARs or TBCs identified are Maximum Contaminant Levels (MCLs), the GA standard, or the Secondary Drinking Water Regulations (SEC).

Rationale codes

Selection Reason: Deletion Reason: Above Screening Levels (ASL) Essential Nutrient (NUT) Below Screening Level (BSL)

Definitions:

Q = Qualifier J = Estimated Value COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

MCL = Federal Maximum Contaminant Level

GA = New York State Class GA Groundwater Standard (TOGS 1.1.1, June 1998 with updates)

SEC = USEPA Secondary Drinking Water Regulation, non-enforceable (EPA 822-B-00-001, Summer 2000)

#### Motor

- 1. Field duplicates were averaged and regarded as one entry. Half the reporting limits were assumed for non-detects for the average calculation. Lab duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
- 2. The maximum detected concentration was used for screening.
- 3. No background data are available.
- 3. IVO deckeround und aut are avaiable.
  4. EPA Region 9 Preliminary Remediation Goals (PRGs) for tap water. On-line resources available at http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated December 2004.

Target Cancer Risk = 1E-6; Target Hazard Quotient =1. Ingestion from drinking and inhalation of volatiles during showering are evaluated to derive the PRGs.

The PRGs corresponding to a hazard quotient of 1 was adjusted by multiplying 0.1 before they were used as screening values.

Maximum Contaminant Level (MCL) for lead was used as screening value for lead as no Region 9 PRG is available.

PRG for endrin was used as screening value for endrin ketone.

Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 2L/day water intake and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 2-5 yr children (1400 mg/day for potassium) from Marilyn Wright (2001) Dietary Reference Intakes.

For sodium, an upper limit intake of 2,400 mg/day (http://www.mealformation.com/dailyval.html) was used.

PRG for chromium (VI) was used as screening value for chromium.

5. Potential ARAR values are from the New York State Ambient Water Quality Standards, Class C for Surface Water.

6. Rationale codes Selection Reason:
Deletion Reason:

Above Screening Levels (ASL)
Essential Nutrient (NUT)
Below Screening Level (BSL)

Individual Chemicals Evaluated (ICE)

Definitions:

COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

Q = Qualifier

J = Estimated Value

#### Table 2A

# OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN IN SEAD-121I SURFACE SOIL SEAD-121I

#### Notes:

- 1. Field duplicates were averaged and regarded as one entry. Half the reporting limits were assumed for non-detects for the average calculation.

  Lab duplicates were not included in the assessment. (dup) indicates that the maximum concentration was detected in a duplicate pair. The maximum concentration reported is the average value of the sample and its duplicate. Range of reporting limits were presented for nondetects only.
- 2. The maximum detected concentration was used for screening.
- 3. Background value is the maximum detected concentration of the Seneca background dataset.
- 4. EPA Region 9 Preliminary Remediation Goals (PRGs) for residential soil. On-line resources available at http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated December 2004.

Target Cancer Risk = 1E-6; Target Hazard Quotient =1. Direct contact exposure (ingestion, dermal contact, and inhalation) is evaluated to derive the PRGs.

The PRGs or RBCs corresponding to a hazard quotient of 1 were adjusted by multiplying 0.1 before they were used as screening values.

PRG for xylenes was used as screening value for meta/para xylenes and ortho xylene.

EPA Region III Risk Based Concentration (RBC) for residential soil was used as screening value for 2-methylnaphthalene as no Region 9 PRG is available. EPA Region III RBC, available on-line at http://www.epa.gov/reg3hwmd/risk/human/rbc/rbc1004.XLS, was calculated based on soil ingestion exposure and a target cancer risk of 1E-6 and a target hazard quotient of 1.

PRG for Aroclor 1254 was used as screening value for Aroclor 1260.

PRG for endosulfan was used as screening value for endosulfan I.

Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 200 mg/day soil ingestion and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium) from Marilyn Wright (2001) Dietary Reference Intakes.

PRG for total chromium (1:6 ratio Cr VI: Cr III) was used as screening value for chromium.

PRG for nickel (soluble salts) was used as screening value for nickel.

PRG for cyanide hydrogen was used for total cyanide.

5. Potential TBC values are from NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046. No ARARs were identified. (on-line resources available at http://www.dec.state.ny.us/website/der/tagms/prtg4046.html)

#### Table 2A

## OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN IN SEAD-1211 SURFACE SOIL

## SEAD-121I

## Seneca Army Depot Activity

| Scenario Timeframe: | Current/Future |  |
|---------------------|----------------|--|
| Medium:             | Soil           |  |
| Exposure Medium:    | Soil           |  |
| Exposure Point:     | SEAD-121I      |  |

| CAS    | Chemical | Minimum       | Q Maximum     | Q | Location of   | Detection | Range of Reporting | Concentration | Maximum    | Screening | Potential          | COPC | Rationale for |
|--------|----------|---------------|---------------|---|---------------|-----------|--------------------|---------------|------------|-----------|--------------------|------|---------------|
| Number |          | Detected      | Detected      |   | Maximum       | Frequency | Limits 1           | Used for      | Background | Value 4   | ARAR /             | Flag | Contaminant   |
|        |          | Concentration | Concentration |   | Concentration | 1         | (mg/kg)            | Screening 2   | Value 3    | (mg/kg)   | TBC                |      | Deletion or   |
|        |          | 1             | 1             |   |               |           |                    | (mg/kg)       | (mg/kg)    |           | Value <sup>5</sup> |      | Selection     |
|        |          | (mg/kg)       | (mg/kg)       |   |               |           |                    |               | , ,        |           | (mg/kg)            |      |               |

6. Rationale codes Selection Reason:

Above Screening Levels (ASL)
Chemicals in the Same Group were retained as COPC (CSG)

Chemicals in the Same Group were retained as

Deletion Reason:

Essential Nutrient (NUT)
Below Screening Level (BSL)

No Screening Value or Toxicity Value (NSV)

Individual Chemicals Evaluated (ICE)

Definitions: COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

Q = Qualifier
J = Estimated Value

NJ = Presence of the analyte has been "tentatively identified" and the associated numerical value represents its approximate concentration.

#### Notes:

- 1. Field duplicates were averaged and regarded as one entry. Half the reporting limits were assumed for non-detects for the average calculation. Lab duplicates were not included in the assessment. (dup) indicates that the maximum concentration was detected in a duplicate pair. The maximum concentration reported is the average value of the sample and its duplicate. Range of reporting limits were presented for nondetects only.
- 2. The maximum detected concentration was used for screening.
- 3. Background value is the maximum detected concentration of the Seneca background dataset.
- 4. EPA Region 9 Preliminary Remediation Goals (PRGs) for residential soil. On-line resources available at http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated December 2004.

Target Cancer Risk = 1E-6; Target Hazard Quotient = 1. Direct contact exposure (ingestion, dermal contact, and inhalation) is evaluated to derive the PRGs.

The PRGs or RBCs corresponding to a hazard quotient of 1 were adjusted by multiplying 0.1 before they were used as screening values.

PRG for xylenes was used as screening value for meta/para xylenes and ortho xylene.

EPA Region III Risk Based Concentration (RBC) for residential soil was used as screening value for 2-methylnaphthalene

as no Region 9 PRG is available. EPA Region III RBC, available on-line at http://www.epa.gov/reg3hwmd/risk/human/rbc/rbc1004.XLS, was calculated based on soil ingestion exposure and a target cancer risk of 1E-6 and a target hazard quotient of 1.

http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated December 2004.

Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 200 mg/day soil ingestion and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium) from Marilyn Wright (2001) Dietary Reference Intakes.

PRG for total chromium (1:6 ratio Cr VI: Cr III) was used as screening value for chromium.

PRG for nickel (soluble salts) was used as screening value for nickel.

5. Potential TBC values are from NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046. No ARARs were identified. (on-line resources available at http://www.dec.state.ny.us/website/der/tagms/prtg4046.html)

6. Rationale codes Selection Reason: Above Screening Levels (ASL)

Chemicals in the Same Group were retained as COPC (CSG)

Essential Nutrient (NUT) Deletion Reason:

Below Screening Level (BSL)

No Screening Value or Toxicity Value (NSV)

Individual Chemicals Evaluated (ICE)

Definitions: COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

O = Qualifier

#### Notes

- 1. Field duplicates were averaged and regarded as one entry. Half the reporting limits were assumed for non-detects for the average calculation. Lab duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
- 2. The maximum detected concentration was used for screening.
- 3. No background values available for surface water.
- EPA Region 9 Preliminary Remediation Goals (PRGs) for tap water. On-line resources available at http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls. Last updated December 2004.

Target Cancer Risk = 1E-6; Target Hazard Quotient = 1, Ingestion from drinking and inhalation of volatiles during showering are evaluated to derive the PRGs.

The PRGs corresponding to a hazard quotient of 1 was adjusted by multiplying 0.1 before they were used as screening values.

Maximum Contaminant Level (MCL) for lead was used as screening value for lead as no Region 9 PRG is available.

Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 2L/day water intake

and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and

minimum requirements for 2-5 yr children (1400 mg/day for potassium) from Marilyn Wright (2001) Dietary Reference Intakes.

For sodium, an upper limit intake of 2,400 mg/day (http://www.mealformation.com/dailyval.html) was used.

PRG for chromium (VI) was used as screening value for chromium.

5. Potential ARAR values are from the New York State Ambient Water Ouality Standards, Class C for Surface Water.

6. Rationale codes

Selection Reason: Above Deletion Reason: Essen

Above Screening Levels (ASL)
Essential Nutrient (NUT)

Below Screening Level (BSL)

Definitions:

COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

Q = Qualifier

## Notes:

- 1. Field duplicates were averaged and regarded as one sample entry. Lab duplicates were not included in the assessment. Non-detects were assumed to be half the reporting limit.
- 2. The maximum detected concentration was used as EPC for the RME scenario. Since the sample size was small (10 samples), the maximum detected concentration was used as the EPC as a conservative estimate.

EPC = Exposure Point Concentration

MDC = Maximum Detected Concentration

RME = Reasonable Maximum Exposure

Q - qualifier

## Notes:

- 1. Only SEAD-121C RI Groundwater data was used in the EPC calculations.
- 2. Field duplicates were averaged and regarded as one sample entry. Lab duplicates were not included in the assessment. Concentrations for non-detects were assumed to be half the detection limit.
- 3. The maximum detected concentration was used as EPC for the RME scenario. Since the sample size was small (10 samples), the maximum detected concentration was used as the EPC as a conservative estimate.

## RI = Remedial Investigation

EPC = Exposure Point Concentration

MDC = Maximum Detected Concentration

RME = Reasonable Maximum Exposure

#### Notes

- Field duplicates were averaged and regarded as one sample entry. Lab duplicates were not included in the assessment.
   Non-detects were assumed to be half the reporting limit.
- 2.The EPCs were calculated using the ProUCL (Version 3.00.02) and the EPCs were selected in accordance with the ProUCL Version 3.0 User Guide (USEPA, 2004) and the Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites (USEPA, 2002).
  - HE highly skewed to extremely highly skewed (standard deviation of log-transformed data in the interval (2.0, 3.0] data set.
  - MH moderately to highly skewed (standard deviation of log-transformed data in the interval (1.0, 2.0] data set.
  - MO moderately skewed (standard deviation of log-transformed data in the interval (0.5,1] data set.
  - M mildly skewed (standard deviation of log-transformed data less than or equal to 0.5) data set.

## Notes:

- 1. Field duplicates were averaged and regarded as one sample entry. Lab duplicates were not included in the assessment. Non-detects were assumed to be half the reporting limit.
- 2. The maximum detected concentration was used as EPC for the RME scenario. Since the sample size was small (10 samples), the maximum detected concentration was used as the EPC as a conservative estimate.

EPC = Exposure Point Concentration

MDC = Maximum Detected Concentration

RME = Reasonable Maximum Exposure

N/A = Not Applicable

IRIS = Integrated Risk Information System

HEAST= Health Effects Assessment Summary Tables

NCEA = National Center for Environmental Assessment

PPRTV = EPA's Provisional Peer Reviewed Toxicity Values

- (1) Source: Supplemental Guidance for Dermal Risk Assessment. Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume I). Final. USEPA. 2004. A default value of 1 was used if no value was available in the USEPA (2004) document.
- (2) Dermal RfD = Oral RfD x Adjustment Factor
- (3) For IRIS values, the date was the last time IRIS was checked.

For NCEA values, the date was the date of the article provided by NCEA.

For PPRTV values, the date was the date of the Region III RBC table, where the PPRTV was cited from.

| İ | Concern               |                        |                   |                   | Factor (1)                | RfD (2)         |       | Organ             | Factors                        |                                 | (MM/DD/YY)                        |
|   |                       |                        |                   |                   |                           |                 |       |                   |                                |                                 |                                   |

- (4) The chronic oral RfD for gamma-chlordane was based on the chronic RfD of chlordane.
- (5) The chronic oral RfD for cadmium was based on water, since cadmium is only a COC for surface water
- (6) The chronic oral RfD for chromium was based on the chronic RfD of chromium (VI).
- (7) The chronic oral RfD for cyanide was based on the chronic RfD of hydrogen cyanide.
- (8) The chronic oral RfD for manganese was adjusted by using a modifying factor of 3 in accordance with the IRIS recommendation.

  In addition, dietary exposure (assumed 5 mg/day) was subtracted. Thus, the RfD used in this risk assessment is 1/6 of the value listed in the IRIS.
- (9) The chronic oral RfD for mercury was based on the chronic RfD of mercuric chloride.
- (10) The chronic oral RfD for thallium was based on the chronic oral RfD of thallium sulfate adjusted for molecular weight differences.

Notes:

N/A = Not Applicable

IRIS = Integrated Risk Information System

PPRTV = EPA's Provisional Peer Reviewed Toxicity Values

(1) Inhalation RfD was adjusted based on the assumption of 70 kg body weight and 20 m³/day inhalation rate.

## Table 8B

## NON-CANCER TOXICITY DATA -- INHALATION

## SEAD-121C and SEAD-121I

## Seneca Army Depot Activity

<sup>(2)</sup> For IRIS values, the date was the last time IRIS was checked.

For PPRTV or NCEA values, the date was the date of the Region III RBC table, where the PPRTV was cited from.

- (3) The chronic oral RfD for chromium was based on the chronic RfD of chromium (VI).
- (4) The chronic data for mercury was based on the chronic data of elemental mercury.

### Notes:

- E Evidence of noncarcinogenicity
- (1) Source: USEPA (2004) Supplemental Guidance for Dermal Risk Assessment. Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume I). Final. A default value of I was used if no value was available in the USEPA (2004) document.
- (2) Dermal Cancer Slope Factor = Oral Cancer Slope Factor/Adjustment Factor
- (3) For IRIS values, the date was the last time IRIS was checked.
  For PPRTV values, the date was the date of the Region III RBC table, where the PPRTV was cited from.

IRIS = Integrated Risk Information System
HEAST= Health Effects Assessment Summary Tables
NCEA = National Center for Environmental Assessment

EPA Group:

- A Human carcinogen
- B1 Probable human carcinogen indicates that limited human data are available
- B2 Probable human carcinogen indicates sufficient evidence in animals and inadequate or no evidence in humans
- C Possible human carcinogen
- D Not classifiable as a human carcinogen
- E Evidence of noncarcinogenicity

Notes:

- (1) The adjustment was based on an assumption of 70 kg body weight and 20 m<sup>3</sup>/day inhalation rate.
- (2) The date was the last time IRIS was checked.

## Table 9A

## CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x CF x FI x EF x ED BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Soil, mg/kg

EPC = Exposure Point Concentration in Soil, mg/kg
IR = Ingestion Rate
CF = Conversion Factor

FI = Fraction Ingested

EF = Exposure Frequency ED = Exposure Duration BW = Bodyweight AT = Averaging Time Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

#### Table 9B

#### CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x CF x SA x AF x ABS x EV x EF x ED

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Soil, mg/kg CF = Conversion Factor

EV = Event Frequency EF = Exposure Frequency ED = Exposure Duration

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

SA = Surface Area Contact AF = Adherence Factor

AT = Averaging Time

BW = Bodyweight ABS = Absorption Factor

Absorption factor for benzene was assumed to be 0.01 in accordance with the USEPA Region 4 (2000) guidance for VOCs.

Supplemental Guidance to RAGS: Region 4 Bulletins, Human Health Risk Assessment Bulletins (http://www.epa.gov/region4/waste/ots/healtbul.htm).

<sup>\*</sup> Absorption factors from Exhibit 3-4 of USEPA (2004) Supplemental Guidance for Dermal Risk Assessment, Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume I). Absorption factors for antimony, copper, and iron were assumed to be 0.001 in accordance with the USEPA Region 4 (2000).

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

(2) This EPC was used for the construction worker.

<sup>(1)</sup> This EPC was used for the industrial worker and the adolescent trespasser.

## Attachment 2 Table 9D

## CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF DITCH SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x IR x CF x FI x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Ditch Soil, mg/kg

IR = Ingestion Rate

CF = Conversion Factor FI = Fraction Ingested

EF = Exposure Frequency ED = Exposure Duration

BW = Bodyweight
AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

And the second s

#### Table 9E

#### CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO DITCH SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C

#### Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x CF x SA x AF x ABS x EV x EF x ED

BW x AT

EV = Event Frequency

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Ditch Soil, mg/kg CF = Conversion Factor

EF = Exposure Frequency ED = Exposure Duration

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

SA = Surface Area Contact AF = Adherence Factor ABS = Absorption Factor

BW = Bodyweight AT = Averaging Time

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

Kp value from Exhibit 3-1 of "Supplemental Guidance for Dermal Risk Assessment", Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume 1), August 16, 2004. For arsenic, iron, manganese, thallium, and vanadium the default inorganic value of 0.001 was used. Kp for Cr(VI) was used for chromium.

#### Table 9H

# CALCULATION OF INTAKE AND RISK FROM THE INTAKE OF GROUNDWATER REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121C

#### Seneca Army Depot Activity

| Equation for Intake (mg/kg-day) = EPC x IR x EF x ED                |                      |   |
|---|----------------------|---|
| BW x AT   |                      | Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose |
| Variables (Assumptions for Each Receptor are Listed at the Bottom): |                      |   |
| EPC = Exposure Point Concentration in Groundwater (mg/L)            | ED=Exposure Duration | Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor    |
| IR = Intake Rate  | BW=Bodyweight        |   |
| EF = Exposure Frequency   | AT=Averaging Time    |   |

NA= Information not available.

#### Table 10A

#### CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-121I

Seneca Army Depot Activity

EPC x IR x CF x FI x EF x ED Equation for Intake (mg/kg-day) = BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom):

EPC = Exposure Point Concentration in Soil, mg/kg

FI = Fraction Ingested

IR = Ingestion Rate CF = Conversion Factor EF = Exposure Frequency ED = Exposure Duration BW = Bodyweight AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

NA= Information not available.

#### Table 10B

#### CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-1211

#### Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x CF x SA x AF x ABS x EV x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Soil, mg/kg

EV = Event Frequency EF = Exposure Frequency ED = Exposure Duration BW = Bodyweight

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

CF = Conversion Factor
SA = Surface Area Contact
AF = Adherence Factor ABS = Absorption Factor

AT = Averaging Time

#### CALCULATION OF INTAKE AND RISK FROM THE INGESTION OF DITCH SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-1211

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) =

EPC x IR x CF x FI x EF x ED

BW x AT

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Ditch Soil, mg/kg

IR = Ingestion Rate
CF = Conversion Factor FI = Fraction Ingested

EF = Exposure Frequency ED = Exposure Duration

BW = Bodyweight AT = Averaging Time Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

#### Table 10E

#### CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO DITCH SOIL REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-1211

Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = EPC x CF x SA x AF x ABS x EV x EF x ED

BW x AT

BW = Bodyweight

AT = Averaging Time

Variables (Assumptions for Each Receptor are Listed at the Bottom): EPC = Exposure Point Concentration in Ditch Soil, mg/kg

ABS = Absorption Factor

CF = Conversion Factor

SA = Surface Area Contact AF = Adherence Factor

EV = Event Frequency EF = Exposure Frequency ED = Exposure Duration

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.

NA= Information not available.

Kp value from Exhibit 3-1 of "Supplemental Guidance for Dermal Risk Assessment", Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume 1), August 16, 2004. For arsenic, iron, manganese, thallium, and vanadium the default inorganic value of 0.001 was used. Kp for Cr(VI) was used for chromium.

XLSTAT 2006 - Two-sample t-test and z-test - on 4/12/2006 at 9:49:13 AM

Sample 1: Workbook = AlMnFedata.xls / Sheet = 121Cdata / Range = '121Cdata'!\$A\$3:\$A\$70 / 68 rows and 1 column (SEAD-121C Soil)

Sample 2: Workbook = AlMnFedata.xls / Sheet = 121Cdata / Range = '!\$C\$3:\$C\$56 / 54 rows and 1 column (Seneca Soil Background)

Hypothesized difference (D): 0

Significance level (%): 5

Summary statistics

•

#### Summary statistics:

| Variable | Observations | Obs. with missing data | Obs. without missing data | Minimum  | Maximum   | Mean      | Std. deviation |
|----------|--------------|------------------------|---------------------------|----------|-----------|-----------|----------------|
| Varl     | 6            | 8 0                    | 68                        | 1730.000 | 17600.000 | 11072.426 | 3389.584       |
| Var1(2)  | 5            | 4 0                    | 54                        | 5560.000 | 20500.000 | 13205.741 | 4158.638       |

Fisher's F-test / Two-tailed test:

95% confidence interval on the ratio of variances:

] 0.663, 0.663 [

| Ratio                | 0.664    |
|----------------------|----------|
| F (Observed value)   | 13.287   |
| F (Critical value)   | 1.003    |
| DF1                  | 67       |
| DF2                  | 53       |
| p-value (one-tailed) | < 0.0001 |
| alpha                | 0.05     |
|                      |          |

#### Test interpretation:

H0: The ratio between the variances is not significantly different from 0.

Ha: The ratio between the variances is significantly lower than 0.

As the computed p-value is lower than the significance level alpha=0.05, one should reject the null hypothesis H0, and accept the alternative hypothesis Ha.

The risk to reject the null hypothesis H0 while it is true is lower than 0.01%.

t-test for two independent samples / Lower-tailed test (assumed different variances for two samples):

95% confidence interval on the difference between the means:

]-Inf, -972.216[

| Difference           | -2133.314 |
|----------------------|-----------|
| t (Observed value)   | -3.050    |
| t (Critical value)   | 1.660     |
| DF                   | 101       |
| p-value (one-tailed) | < 0.0001  |
| alpha                | 0.05      |

The number of degrees of freedom is approximated by the Welch-Satterthwaite formula

The critical t is estimated using the Cochran-Cox approximation

Test interpretation:

H0: The difference between the means is not significantly different from 0.

Ha: The difference between the means is significantly lower than 0.

As the computed p-value is lower than the significance level alpha=0.05, one should reject the null hypothesis H0, and accept the alternative hypothesis Ha.

The risk to reject the null hypothesis H0 while it is true is lower than 0.01%.

#### Table 15B

Significance level (%): 5

Summary statistics

•

#### Summary statistics:

| Variable | Observations | Obs. with missing data | Obs. without missing data | Minimum  | Maximum   | Mean      | Std. deviation |
|----------|--------------|------------------------|---------------------------|----------|-----------|-----------|----------------|
| Var1     | 10           | C                      | 10                        | 5650.000 | 27300.000 | 18305.000 | 5904.727       |
| Var1(2)  | 54           |                        | 54                        | 8770.000 | 38600.000 | 24660.556 | 6853.812       |

#### Fisher's F-test / Two-tailed test:

95% confidence interval on the ratio of variances:

] 0.791, 0.791 [

| Ratio                | 0.742    |
|----------------------|----------|
| F (Observed value)   | 14.844   |
| F (Critical value)   | 0.939    |
| DF1                  | 9        |
| DF2                  | 53       |
| p-value (one-tailed) | < 0.0001 |
| alpha                | <br>0.05 |

#### Test interpretation:

H0: The ratio between the variances is not significantly different from 0.

Ha: The ratio between the variances is significantly lower than 0.

As the computed p-value is lower than the significance level alpha=0.05, one should reject the null hypothesis H0, and accept the alternative hypothesis Ha.

The risk to reject the null hypothesis H0 while it is true is lower than 0.01%.

t-test for two independent samples / Lower-tailed test (assumed different variances for two samples):

95% confidence interval on the difference between the means:

]-Inf, -2677.526 [

| Difference           | -6355.556 |
|----------------------|-----------|
| t (Observed value)   | -3.045    |
| t (Critical value)   | 1.762     |
| DF                   | 14        |
| p-value (one-tailed) | < 0.0001  |
| alpha                | 0.05      |

The number of degrees of freedom is approximated by the Welch-Satterthwaite formula

The critical t is estimated using the Cochran-Cox approximation

#### Test interpretation:

H0: The difference between the means is not significantly different from 0.

Ha: The difference between the means is significantly lower than 0.

As the computed p-value is lower than the significance level alpha=0.05, one should reject the null hypothesis H0, and accept the alternative hypothesis Ha.

The risk to reject the null hypothesis H0 while it is true is lower than 0.01%.
