Seneca Army Depot – Soil and Sediment Remediation Project
Romulus, New York
Open Burning Grounds – Completion Report
DCN: SEDA-052005-ABFK

Dear Mr. Battaglia:

Weston Solutions, Inc. is submitting one (1) copy of the Completion Report for the Open Burning Grounds Soil and Sediment Remediation Project located at the Seneca Army Depot Activity in Romulus, New York.

Additional copies have been forwarded to SEDA, USACE(New England District), NYSDEC, NYSDOH, and USEPA based on the distribution list below. Should you require any information or additional copies of this report, please contact me at (603) 656-5428.

Very truly yours,

WESTON SOLUTIONS, INC.

SUBJECT: Completion Report for the Soil and Sediment Remediation Project performed at the Open Burning Grounds Site at Seneca Army Depot Activity, Romulus, New York

Dear Mr. Vazquez / Mr. Gupta:

Weston Solutions, Inc. is submitting the Completion Report for the Soil and Sediment Remediation project performed at the Open Burning Grounds Site at the Seneca Army Depot Activity (SEDA), Romulus, New York.

This report is being submitted on behalf of SEDA and the USACE Seneca Area Office. One (1) copy of the report is included for your review. As indicated below, additional copies of the report have been mailed to the U.S. Army Corps of Engineers, SEDA, and the New York State Department of Health. An electronic copy is included with the report on compact disc (PDF format) for your information.

Please call me at (603) 656-5428 if you have any questions regarding this transmittal.

Very truly yours,
Weston Solutions, Inc.

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

This Completion Removal Report documents soil and sediment remediation of the Open Burning (OB) Grounds at the Seneca Army Depot Activity (SEDA) located in Romulus County, New York. This work was performed by Weston Solutions, Inc. (WESTON®) under the Hazardous, Toxic and Radioactive Waste Contract Number DACW33-95-D-0004, Delivery Order No. 0013 for the U.S. Army Corps of Engineers (USACE), New England District with support provided by USACE, New York District and SEDA.

Remediation activities at the site were conducted between June 1999 and May 2004. Work was conducted over this 5-year period in several different mobilizations and included the following tasks:

- Mobilization and site preparation, including surveying and excavation area layout.
- Decommissioning of 32 groundwater monitoring wells and 1 soil boring.
- Excavation of approximately 88,000 cubic yards (cy) of Case I soil (>800 milligrams per kilogram (mg/kg) total lead), Case II soil (500 mg/kg – 800 mg/kg total lead), and Case III soil (<500 mg/kg total lead).
- Diversion of Reeder Creek and excavation of approximately 2,300 cy of creek sediments.
- Post-excavation confirmation sampling and characterization sampling.
- Stabilization of soils and sediments to meet Toxicity Characteristic Leaching Procedure hazardous waste disposal criteria.
- Off-site disposal of approximately 7,000 tons of untreated soil and 50,400 tons of treated (stabilized) soils and sediment as non-hazardous material at a licensed disposal facility.
- Off-site disposal of approximately 283,300 gallons of wastewater generated from site activities.
- Site restoration including: backfilling, grading, and seeding the site.

At the start of the project, the activities listed above were coordinated between WESTON and EOD Technologies, Inc. (EODT). Initial ordnance explosive removal, and soil excavation and handling activities were performed by EODT. All confirmation and characterization sampling

was performed by WESTON. In Fall 2001, WESTON assumed EODT's responsibilities and continued with all remaining remediation tasks through restoration of the OB Grounds.

The following cleanup objectives were established for the OB Grounds:

- A cleanup goal of 60 mg/kg total of lead in soil (for cover purposes) and 500 mg/kg for off-site disposal.
- Cleanup goals of 31 mg/kg total lead and 16 mg/kg total copper for sediment.

Confirmatory soil sample results obtained throughout execution of the OB Grounds remediation indicate that the horizontal and vertical extents of the pad and berm locations have been sufficiently delineated and reduced to below 60 mg/kg (20.6 mg/kg average), while all surface soils and perimeter locations have been reduced to below 500 mg/kg (55.1 mg/kg sitewide average). In addition, elevated levels of lead and copper previously identified in Reeder Creek sediments have been delineated and remediated.

A total of 25 grids encompassing an area of approximately 7 acres have been backfilled to a depth of 9 inches using excavated soils containing less than 60 mg/kg total lead. Additional clean topsoil has been imported to the site and all accessible areas of the OB Grounds have been fine-graded and seeded.

Based on the data obtained during the soil and sediment remediation, it is recommended that USACE, SEDA, New York State Department of Environmental Conservation, and U.S. Environmental Protection Agency evaluate the OB Grounds for closure and/or transfer status.

SECTION 1

INTRODUCTION

1. INTRODUCTION

This Completion Removal Report documents soil and sediment remediation of the Open Burning (OB) Grounds ("the Site") at the Seneca Army Depot Activity (SEDA) located in Romulus County, New York. This work was performed by Weston Solutions, Inc. (WESTON®) under Hazardous, Toxic and Radioactive Waste Contract Number DACW33-95-D-0004, Delivery Order No. 0013, for the U.S. Army Corps of Engineers (USACE), New England District (CENAE) with support provided by USACE, New York District and SEDA. All work performed under this contract was conducted in accordance with the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) and the "Federal Facility Agreement under CERCLA Section 120 in the matter of Seneca Army Depot, Romulus, New York".

The following documents governed the scope of work, procedures and methods, and quality control/quality assurance (QC/QA) requirements associated with this project:

- *Section C – Final Technical Specifications, Soil and Sediment Remediation at the Open Burning (OB) Grounds, Parsons Engineering Science, Inc. (Parsons), August 1998.*
- *Revised Draft Project Work Plan and Contractor Quality Control Plan (CQCP), WESTON, April 1999.*
- *Revised Draft Project Sampling and Analysis Plan and Quality Assurance Project Plan, WESTON, April 1999.*
- *Revised Draft Site Safety and Health Plan, Emergency Response and Contingency Plan, and Site Specific Health and Safety Plan, WESTON, April 1999.*
- *Contractor Quality Control Plan, U.S. Army Corps of Engineers, New York District (CENAN), March 1998.*

1.1 SITE BACKGROUND

The OB Grounds was included on the Federal Facilities National Priorities List on 13 July 1989. In early 1995, under the Base Realignment and Closure process, the Department of Defense

recommended closing the SEDA. This recommendation was approved in October 1995 and SEDA was scheduled for closure by July 2001.

Since its inception in 1941, SEDA's primary mission was the receipt, storage, maintenance and supply of military items. This function included disposal of military ammunition and explosives by burning and detonation in the OB Grounds. Originally, open burning of munitions was conducted directly on the land surface. However, due to the poorly drained soils, individual burn pads were constructed to allow for drier burns. Munitions waste was open-burned on the ground at the OB Grounds until 1987 when an elevated burning tray was constructed for that purpose.

1.2 SITE DESCRIPTION

Seneca Army Depot Activity is located in Romulus, Seneca County, New York as shown in Figure 1-1. The facility property, which occupies approximately 10,600 acres, is bounded to the west by State Route 96A and to the east by State Route 96. Geneva and Rochester are located 14 and 50 miles, respectively, to the northwest. Syracuse is 50 miles to the northeast. Ithaca is 31 miles to the south. The area immediately surrounding the Site is generally used for agriculture.

As shown in Figure 1-2, the OB Grounds occupies approximately 30 acres in the northwest corner of the SEDA property. The Site is located on gently sloping terrain that is bounded on the east by Reeder Creek. Reeder Creek is a perennial creek that is generally less than 1 foot (ft) deep and does not exceed 30 feet (ft) in width. It flows into Seneca Lake, which is located approximately 10,000 ft west of the Site. Seneca Lake is used as a source of drinking water for SEDA and the surrounding communities.

The Site is sparsely vegetated with grass and brush, and there are no permanent structures within the area other than concrete bunkers. The land surface is sloped from west to east and surface water drains through a series of ditches and surface swales. Existing drainage areas are poorly defined and are blocked and/or collapsed in some areas.

A total of 11 Burn Pads and the low-lying hills were constructed at the Site on top of the existing ground surface. The burn pads ranged in size from approximately 100 ft by 100 ft (Pad D) to 300 ft by 800 ft (Pad G), and contain from 1 ft to 2 ft of broken/crushed shale at the surface. The burn pads were each surrounded by a berm on three sides that was composed of soil and burn wastes. The former footprint of the burn pads and berms is shown in Figure 1-2.

1.3 PROJECT OBJECTIVES

The purpose of this project was to excavate soils from the OB Grounds to attain a remedial objective of 500 milligrams per kilogram (mg/kg) of lead in soils for the Site. It was initially estimated that approximately 19,500 cubic yards (cy) of soil containing lead over 500 mg/kg would require excavation and off-site disposal (Parsons, 1998). Prior to off-site disposal, it was estimated that approximately 16,250 cy of the excavated soil would require solidification/stabilization (Parsons, 1998).

The proposed remedial tasks required to meet the project objectives included the following:

- Perform a limited pre-excavation survey of the OB Grounds to verify the excavation area layout. Perform a pre-excavation survey of Reeder Creek.
- Abandon existing monitoring wells.
- Excavate impacted site soils from the burn pads, berm areas, and low-lying hills.
- Sift and segregate excavated material into Case I (>800 mg/kg total lead), Case II (500-800 mg/kg of total), and Case III (<500 mg/kg total lead) soils.
- Transport soils to the staging area and sample Case I and Case II soils for Toxicity Characteristic Leaching Procedure (TCLP) metals. Sample Case III soils for total lead and TCLP metals, if necessary.
- Excavate all remaining surface soil to a minimum depth of 1 ft below ground surface (bgs) within the 30-acre OB Grounds, and sift and transport the excavated soil to the staging area for characterization.
- Excavate lead and copper-contaminated sediment from Reeder Creek and transport to the Case II soil stockpile staging area. Sample sediments for total lead and TCLP metals at stockpile staging area.
- Backfill all soil containing lead between 60 mg/kg and 500 mg/kg with soil less than 60 mg/kg lead.

- Transport and dispose of soils that pass TCLP criteria as Subtitle D Non-Hazardous material.
- Perform on-site stabilization treatment of soils that exceed the TCLP criteria prior to off-site disposal as a Subtitle D Non-Hazardous material or transport this material off-site for treatment.
- Collect, transport, treat, and/or dispose of materials generated from remediation activities including, but not limited to: wastewater, debris, and personal protective equipment (PPE).
- Perform confirmation sampling of the burn pad, berm, low-lying hill excavations, and the Reeder Creek excavations. Perform additional excavations in areas that contain total lead and/or copper levels above the cleanup goals.
- Perform surface and perimeter sampling within the OB Grounds after excavation activities are complete.
- Cover soils that contain >60 mg/kg total lead with 9-inch soil cover.
- Perform a post-excavation survey of the OB Grounds and Reeder Creek.

The project objectives listed above were coordinated between WESTON and EOD Technologies, Inc. (EODT). Initial ordnance explosive (OE) removal, and soil excavation and handling activities were performed by EODT. All confirmation and characterization sampling was performed by WESTON. In the Fall of 2001, WESTON assumed EODT's responsibilities and continued with responsibilities for all remediation tasks through the restoration of the OB Grounds.

The following specific cleanup objectives were established for the OB Grounds:

- Remove burn pads and berms containing elevated lead concentrations to original ground elevation.
- Remove burn area pads containing elevated lead concentrations to a minimum depth of 1 ft.
- Remove all soil containing lead concentrations >500 mg/kg and transport off-site for disposal.
- Place fill over areas >60 mg/kg with 9 inches of clean soil cover.
- Remove soil containing total explosives (<100,000 mg/kg).

The following cleanup objectives were established for Reeder Creek sediments:

- 31 mg/kg (total lead).
- 16 mg/kg (total copper).

SECTION 2

SITE PREPARATION AND SITE CONTROLS

2. SITE PREPARATION AND SITE CONTROLS

2.1 PRE-PLANNING

Prior to the commencement of on-site activities, WESTON prepared and CENAE and CENAN approved the following project plans to govern field work practices:

- *Revised Draft Project Work Plan (WP) and Contractor Quality Control Plan (CQCP).*
- *Revised Draft Project Sampling and Analysis Plan (SAP) and Quality Assurance Project Plan.*
- *Revised Draft Site Safety and Health Plan, Emergency Response and Contingency Plan, and Site Specific Health and Safety Plan (SSHASP).*

A pre-construction meeting was held on 5 May 1999. The following parties were in attendance: WESTON, EODT, CENAN, and SEDA. SEDA policies and procedures, contractor coordination, contract administrative requirements and procedures, cost tracking and cost control, and quality control issues were discussed.

A Project Opening Meeting, Contractor Quality Control Meeting, and Contractor Health and Safety Meeting was held on 2 June 1999, and was attended by WESTON and CENAN. Mobilization of project personnel, materials, site support facilities, and equipment commenced on 3 June 1999.

2.2 CLEARING AND GRUBBING

The soil stockpile area (400 ft by 800 ft) was cleared and grubbed by SEDA prior to mobilization of the Site. Additional clearing and grubbing was performed by WESTON during the grading and construction of the stockpile area. The west bank of Reeder Creek was cleared by SEDA with a Hydro-Ax on 20 August 1999, and manually cleared and grubbed by WESTON between 25 August and 28 September 1999, prior to pre-excitation cross-section survey activities. Tree stumps, branches and brush generated from these activities were stockpiled in the turn-a-round at the north end of the Haul Road adjacent to Reeder Creek.

2.3 SOIL STOCKPILE STAGING AREAS

The stockpile staging areas were located southeast of the OB Grounds and west of the OB Grounds access road. The Case I and II soil stockpile staging area was constructed between 9 June and 13 July 1999 by WESTON. After grubbing activities were complete, the area was surveyed, then graded to a 0 to 2% slope with the high points at the centerline and the base sloping downward toward the west and east sides. A continuous soil berm was constructed approximately 3-ft high around the perimeter of the staging area. A 20-mil high density polyethylene (HDPE) liner was placed over the 6-ounce geotextile and anchored with soil into the outside of the berm. In order to protect the liner and optimize drainage toward the stormwater runoff collection points, the liner was covered with approximately 4 inches of sand.

The Case III soil stockpile staging area was constructed between 3 September and 20 October 1999 by WESTON. The area was grubbed by SEDA, and WESTON graded and bermed the Case III soil stockpile staging area similar to the Case I and II stockpile staging area. The area was also lined with 6-ounce geotextile fabric and 20-mil HDPE and 6 inches of sand to protect the liner.

Haul roads were constructed to each of these stockpile staging areas between 10 June and 17 June 1999 (Case I and II) and between 24 September and 1 October 1999 (Case III) for transporting soil from the OB Grounds and Reeder Creek to the stockpile. A haul road was constructed to the Case I and II soil stockpile staging area between 29 November and 21 December 1999, for off-site transportation and disposal of the soil. A haul road extension was also constructed within the Case I and II stockpile staging area for loading trucks and heavy equipment.

2.4 DECONTAMINATION AREAS

A heavy equipment decontamination pad was constructed adjacent to the OB Grounds access road. The pad was constructed between 28 June 1999 and 13 July 1999 by WESTON. The 20 ft by 50 ft concrete pad was placed on 1 July 1999. The pad was 6 to 8 inches thick and was reinforced with ½-inch rebar. The plywood walls were covered with a 5 mil polyethylene liner. The pad floor sloped toward a 2 inch by 4 inch sloped center channel drain. This channel drained

decontamination water from the pad to a collection system via a 3½-inch diameter polyvinylchloride pipe. The collection system consisted of a 1,100 gallon polyethylene tank placed in a bermed area which was lined with 20 mil HDPE. A 2-inch centrifugal trash pump was utilized to remove decontamination water from this tank to the 155,000 gallon Modutanks for storage.

Two 155,000 gallon Modutank storage tanks were constructed to store wastewater generated from site activities. These Modutanks were constructed between 24 June and 22 July 1999 by WESTON. Each tank consisted of a 68 ft by 68 ft steel frame with wire supports and a reinforced polyethylene liner placed over a geotextile layer. The steel forms were approximately 4 ft high and supported the liner and water in the tanks. The tanks were constructed inside the lined and bermed Case I and II stockpile staging area, which provided secondary containment. Water was pumped to these tanks from the decontamination pad collection area and the stockpile staging area stormwater runoff collection points via 2-inch centrifugal trash pumps and hoses.

2.5 EROSION AND SEDIMENTATION CONTROL

WESTON was responsible for installing erosion and sedimentation controls for the stockpile staging area and decontamination area. Silt fence and hay bales were installed around the perimeter of these areas between 7 June and 18 June 1999. The silt fence was anchored at least 6 inches bgs and each section of fencing was overlapped by approximately 6 ft with adjacent sections of fencing. The hay bales were installed immediately adjacent to each other, and each hay bale was secured with two wooden stakes.

WESTON was also responsible for installing erosion and sedimentation controls for the Reeder Creek excavations. Silt fence was installed along the west bank of the Reeder Creek excavation areas and up-gradient of the drainage culverts under the OB Grounds access road between 27 August and 9 September 1999.

At the request of the CENAN, WESTON also installed approximately 3,400 ft of silt fence along both sides of the OB Grounds haul road between 16 and 22 September 1999.

2.6 AIR MONITORING

As described in the *SSHASP* (WESTON, 1999), the primary contaminant of concern for worker exposure for this project was lead. Air monitoring of dust levels and personnel air sampling were conducted to ensure worker protection. Also, several different levels of PPE were utilized during on-site field activities. Water was used to suppress dust in the exclusion zone and along the transport roads.

Off-site upwind and downwind dust levels were continuously monitored and recorded during all on-site activities using a Personal Data Ram as required by the New York State Department of Environmental Conservation (NYSDEC). During the first 3 days of an intrusive activity and once a week thereafter, personnel air monitoring for dust particles was conducted using a Miniram. Also, during the first 3 days of an intrusive activity and once a week thereafter, until deemed unnecessary by the Site Health and Safety Officer, the Project Manager, the Site Manager and the Certified Industrial Hygienist, personnel air sampling was conducted. Personnel air sampling involved collection of filters from a personal air monitor to confirm airborne lead levels in accordance with the National Institute for Occupational Safety and Health Method 7300. Engineering controls were modified as necessary based on fluctuations in airborne lead levels

SECTION 3

MONITORING WELL DECOMMISSIONING

3. MONITORING WELL DECOMMISSIONING

A total of 32 monitoring wells and 1 ground boring were decommissioned by Maxim Technologies, Inc. between 6 August 1999 and 27 August 1999, prior to the start of excavation activities in the OB Grounds. A well decommissioning summary including the well ID, well depth, water depth, and well diameter parameters is presented in Table 3-1. Monitoring well locations are shown in Figures 14 and 15 of the *Section C Technical Specifications* (Parsons, 1998). Monitoring Well Field Inspection Logs for these wells, as required by the NYSDEC Well Decommissioning Program, are on file and available upon request. Monitoring wells MW-12, MW-14, and MW-27 were Resource Conservation and Recovery Act (RCRA) wells that were decommissioned per USACE and SEDA approval on 3 August 1999. Monitoring well MW-28 could not be located. Ground boring GB-20 was located, instead, in the same area and was decommissioned.

Wells were decommissioned in accordance with the NYSDEC Groundwater Monitoring Well Decommissioning Procedures. The case pulling method was used for all wells. The bottoms of the well casings were punctured, and a cement/bentonite grout mixture was pumped into the well as it was pulled out of the ground. Grout was inserted into the wells up to the existing ground surface level.

Table 3-1 Well Decommissioning Summary

| Well ID | Well Depth (ft bgs) | Water Depth (ft bgs) | Well Dia. (in) | Well ID | Well Depth (ft bgs) | Water Depth (ft bgs) | Well Dia. (in) |
|---------|---------------------|----------------------|----------------|---------|---------------------|----------------------|----------------|
| MW-1 | 9.0 | NA | 4 | MW-23 | 13.5 | 7.8 | 2 |

| MW-22 | 16.2 | 7.2 | 2 | GB-20 | 14.0 | 8.9 | 2 |

SECTION 4

SOIL EXCAVATION AND SAMPLING

4. SOIL EXCAVATION AND SAMPLING

Soils in the OB Grounds were surveyed and staked out based on case type, excavated, and segregated for characterization based on the concentration of lead in the soil as determined from the Remedial Investigation/Feasibility Study (RI/FS). Case I soils were anticipated to contain concentrations of total lead greater than 800 mg/kg, Case II soils were anticipated to contain concentrations of total lead between 500 mg/kg and 800 mg/kg, and Case III soils were anticipated to contain concentrations of total lead below 500 mg/kg. In general, soil containing Case I material was excavated first followed by removal of Case II and III soils. Berm material was removed prior to the burn pads to allow equipment access to the pads (from all four directions), to prevent cross contamination and to minimize re-handling the soil.

Based on the RI/FS data, the burn pads and associated berms were initially excavated to the target depths and excavation limits shown in Figures 6 through 11 of the *Section C Technical Specifications* (Parsons, 1998). However, post-excavation sampling indicated that elevated lead concentrations remained at all locations; therefore, additional excavations were performed both laterally and vertically at these locations until the cleanup objective of 60 mg/kg for total lead was achieved. Final excavation limits and elevations for the burn pads and associated berms are shown in Figures 4-1 through 4-12.

4.1 CONFIRMATION SOIL SAMPLING

Following excavation of each burn pad area, confirmation sampling was performed by WESTON in accordance with the *SAP* (WESTON, 1999).

4.1.1 Interim Soil Delineation Screening

A Niton 700-Series X-Ray Fluorescence (XRF) analyzer was used by WESTON in the field to determine interim concentrations of total lead for delineating the lateral extent of excavation. In order to ensure that the data was representative of total lead concentrations, a study was conducted between 25 August and 3 September 1999, to compare total lead results obtained from the XRF and from off-site laboratory analysis. Based on this study, a correlation was determined

for lead at concentrations of 500 mg/kg or less. Following USACE approval, WESTON used the XRF analyzer to screen perimeter Case I and II excavations. Once satisfactory XRF results were obtained for sidewall samples, final confirmation samples were collected and analyzed by the off-site laboratory.

4.1.2 Excavation Sampling

Confirmation samples were collected and analyzed for total lead in each of the burn area excavations. Samples were collected at a frequency of one discrete sample per 2,500 square feet (sf) from the excavation floors and a frequency of one discrete sample per 50 linear feet (lf) from the excavation sidewalls. These sampling frequencies were revised from the *Section C Technical Specification* (Parsons, 1998), frequencies of one discrete sample per 500 sf from the excavation floors and one discrete sample per 200 lf from the excavation sidewalls per approval of USACE and NYSDEC. In cases where shallow excavations were performed (i.e., less than 1-ft depth), sidewalls were removed completely as noted in the figures.

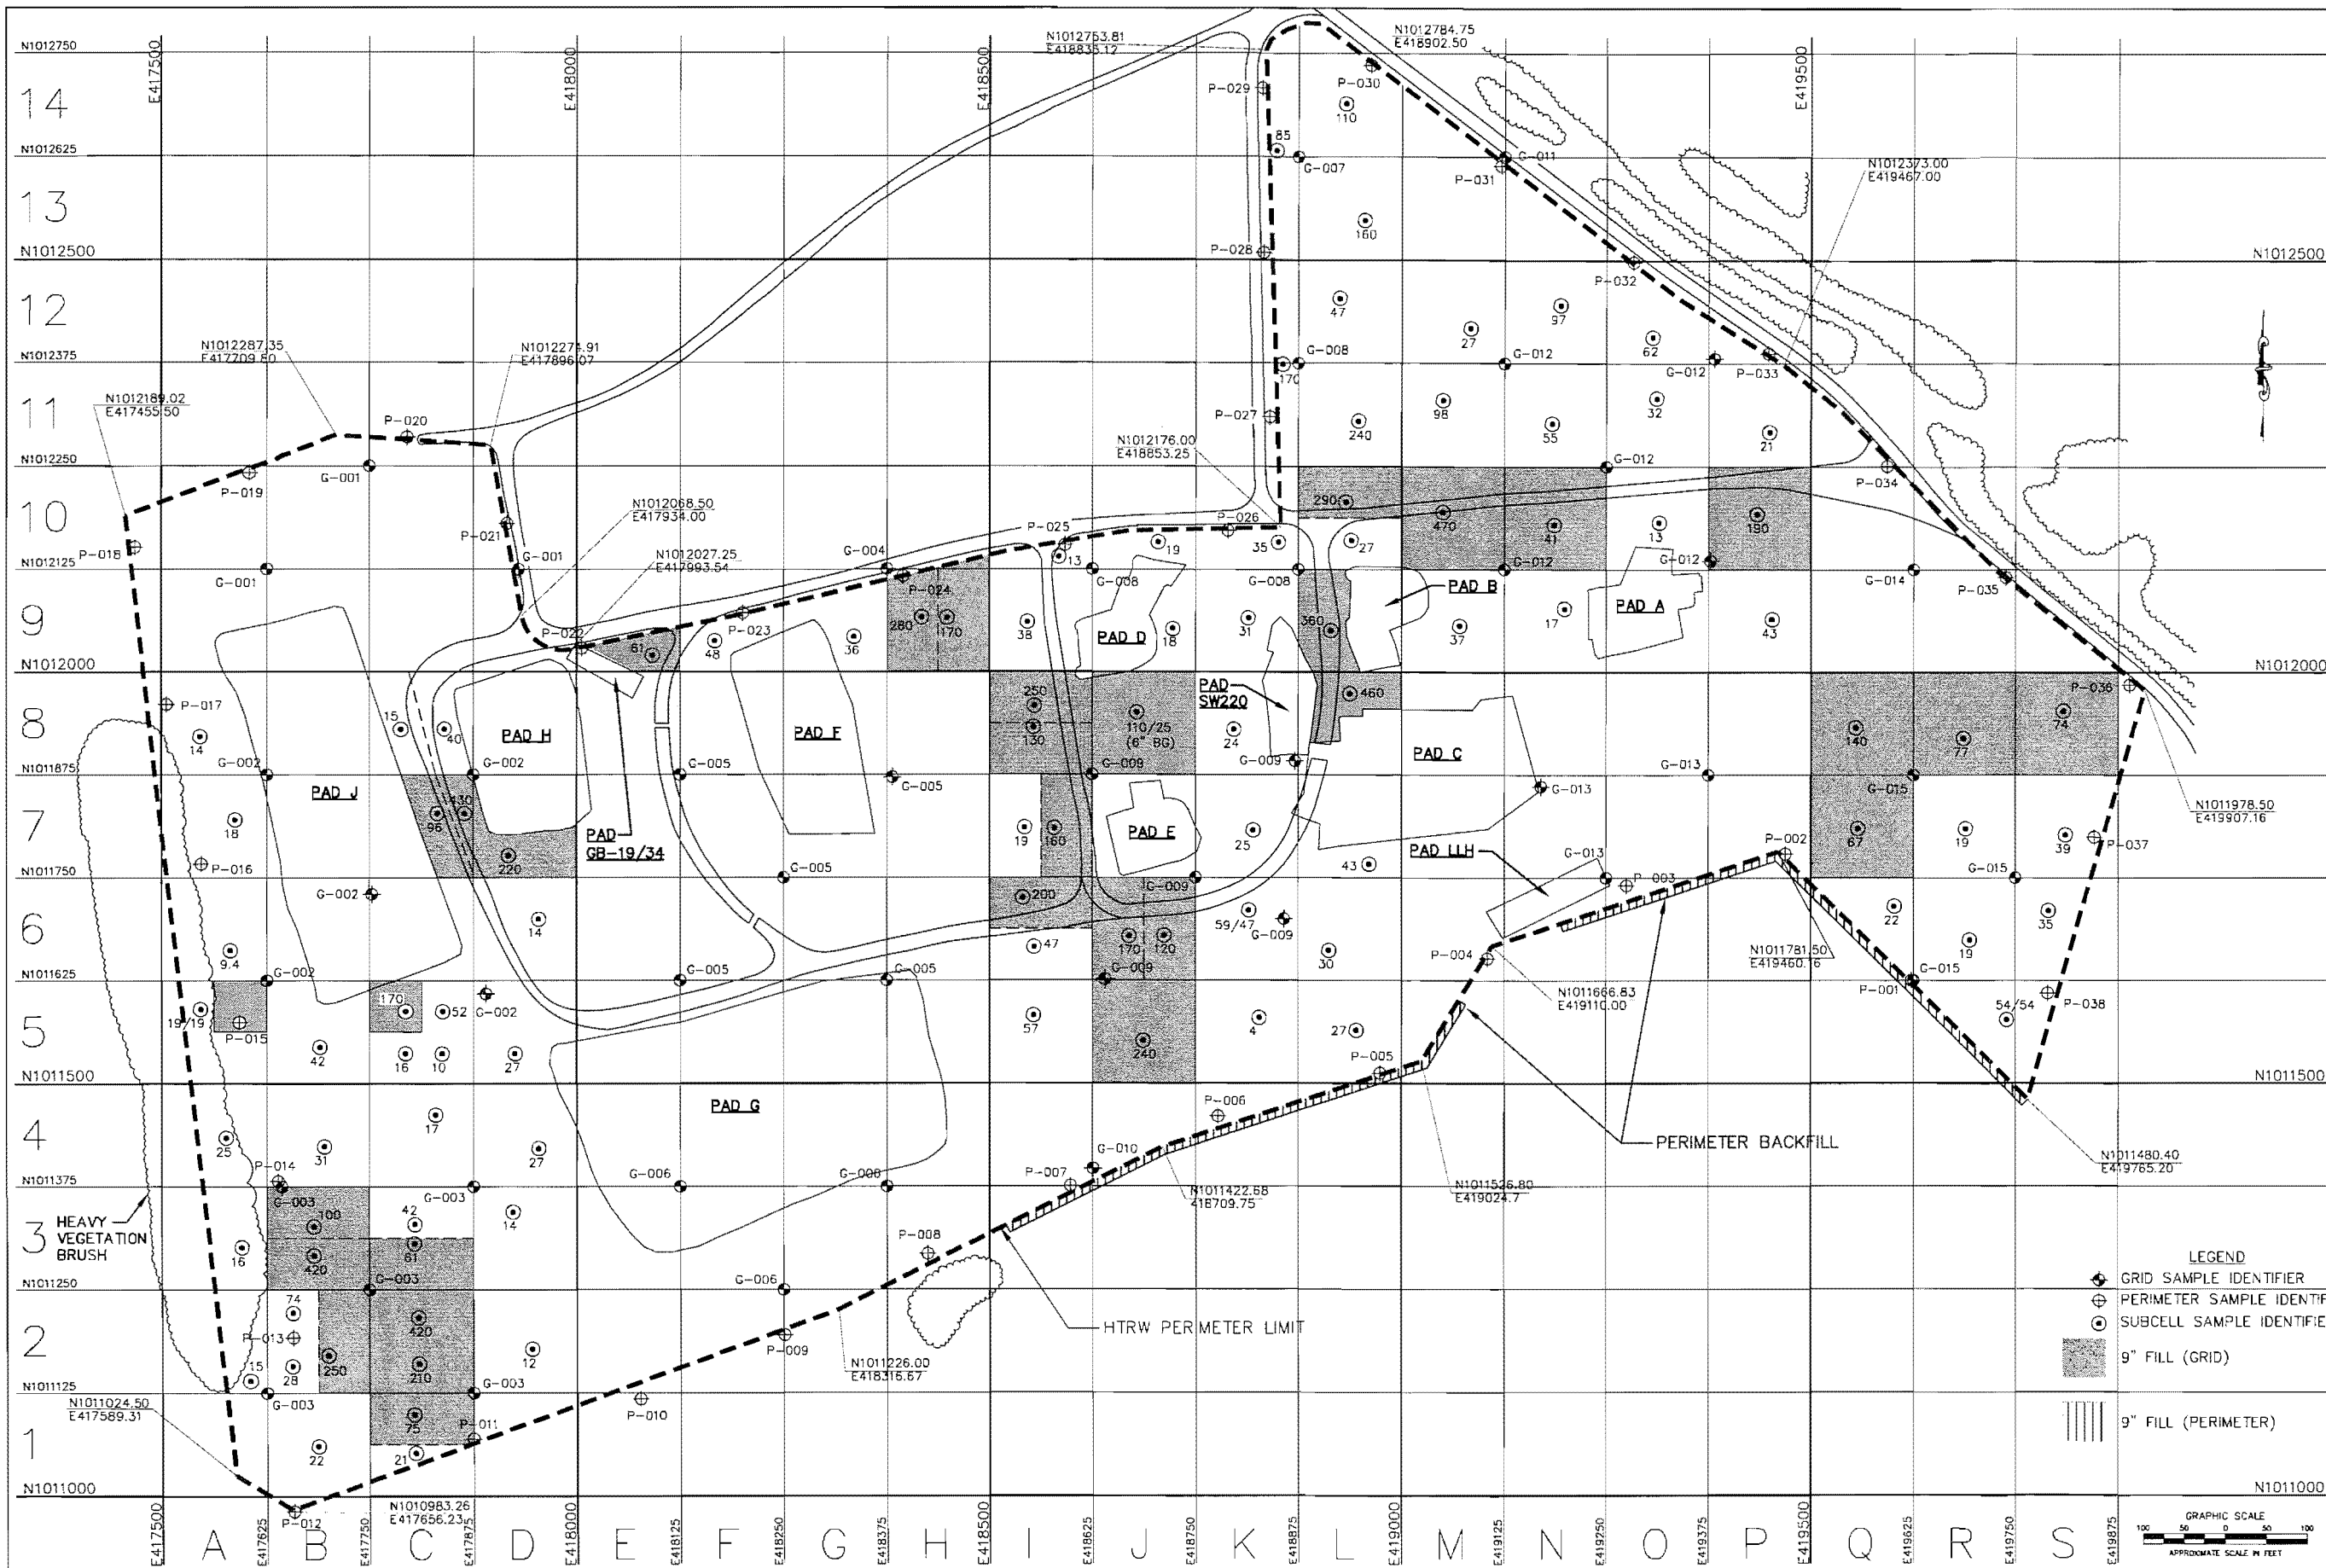

Confirmation samples were also collected and analyzed for explosives from each excavation floor, and one discrete confirmation sample was also collected and analyzed for explosives for each ordnance cache that was encountered.

Final limits of excavation were determined based on survey data generated by Popli Consulting Engineers. Figures depicting the final excavation areas, surveyed coordinates, confirmation sample locations, and the confirmation sample data are included in Figures 4-1 through 4-12.

4.1.3 OB Grounds Grid and Perimeter Sampling

The perimeter of the OB Grounds area was sampled in the fall of 2001. A total of 38 perimeter samples were collected to determine lead concentrations along the perimeter of the Site. One discrete sample was collected and analyzed for total lead at a frequency of one sample per 200 ft along the perimeter of the OB Grounds. These perimeter sample locations and associated sample data are shown in Figure 4-13.

SHT. OF

Confirmation samples were also collected following the completion of the 1-ft cut operation to confirm soil concentrations at levels below 500 mg/kg and to determine soil cover requirements for total lead. A total of 15 initial 5-point composite grid samples were collected and analyzed for total lead at a frequency of one discrete sample per 250,000 sf (500 ft by 500 ft grid). Based on results of these grid samples, further sampling and excavation was performed to refine the limits of soil removed to below 500 mg/kg. If the grid failed (>500 mg/kg total lead), it was excavated over to a depth of between 6 inches and 1 ft specified by USACE (typically 6 inches) and re-sampled. Once excavation was complete, the soil was transported to the oversize pile located north of the perimeter haul road in the OB Grounds. Confirmation data is presented in Table 4-1 for all pad, berm, perimeter, and 1-ft cut samples. Average confirmation sample results for burn pad, berm, perimeter, and 1-ft cut excavations are included in Table 4-2.

SECTION 5

SEDIMENT EXCAVATION AND SAMPLING

5. SEDIMENT EXCAVATION AND SAMPLING

The scope of work for sediment remediation in Reeder Creek included two sections of the creek, a north section (approximately 1,030-ft length) and a south section (approximately 1,145-ft length). The upstream section of the Creek was remediated prior to the downstream section to prevent cross-contamination of sediments. The south, or upstream, section was remediated between 6 October and 29 November 1999. The north, or downstream, section was remediated between 10 October and 11 October 2001. Both sections were diverted of all water prior to starting excavation activities. In addition, OE avoidance support was provided throughout excavation activities for both sections of the Creek.

5.1 REEDER CREEK DIVERSION

To minimize migration of contaminants downstream during excavation activities, water in the creek was diverted. A dam was constructed at the furthest point upstream of the south excavation section and at the furthest point upstream of the north excavation. These dams were constructed of approximately 3-ft by 3-ft by 3½-ft concrete blocks obtained from SEDA. The blocks were placed adjacent to each other across the width of the creek, and a 20-mil HDPE liner was used to cover the blocks; it was anchored approximately 1 ft into the sediment and was secured with sandbags.

An 8-inch pump and discharge pipe were installed to divert the creek water around the south sediment excavation area. Approximately 1,200 ft of discharge pipe was used to divert the creek around the south excavation section. Crushed stone (5 inch minus) was placed at the discharge points to prevent erosion of the streambed during pumping. Two 2-inch trash pumps were used to divert the creek water within the north sediment excavation area. A total of 1,200 ft of discharge pipe was used to lower the water within the north sediment excavation area with the temporary dam in place. Once the water level on the south side of the dam was lowered, the excavation limits within the creek were pumped down.

5.2 REEDER CREEK EXCAVATION

Sediment excavation activities in the south and north creek sections were conducted by WESTON following diversion of the water. A total of approximately 2,300 cy of sediments were removed from the creek using long reach excavators (CAT 325 Longstick and JD 450 with boom extension). Excavators were positioned along the top of the banks and removed sediment perpendicular to the creek channel.

The south excavation area measured approximately 1,145 ft in length and varied in width between 10 ft and 40 ft. Excavation depths generally varied between 1 ft and 3 ft, but were limited at locations where shale was encountered. Excavation was not performed below shale elevations.

The north excavation area measured approximately 1,030 ft in length and varied in width between 10 ft and 25 ft. Excavation depths generally varied between 1 ft and 3.5 ft, and the entire length of the northern creek section was excavated to shale or to bedrock. Excavation was not performed below shale or bedrock elevations.

Pre-excavation and post-excavation cross sections were surveyed for both the north and south excavation sections of Reeder Creek by Popli Consulting Engineers and Surveyors. Cross-sections were surveyed at 50-ft intervals along the length of the creek excavation. Each cross-section included: elevations of the creek center-line, edge of waterline, top of slope, limits of excavation, top of slope, undisturbed ground surface beyond top of slope, and other significant breaks in terrain. All cross-sections and cross-section locations are on file and available upon request.

5.3 CONFIRMATION SEDIMENT SAMPLING

Confirmation sediment samples were collected at a frequency of one discrete sample for every 50 lf along the creek excavation bottom and sidewalls. These samples were analyzed for total lead and copper. Additional excavations were performed for areas that contained concentrations of total lead greater than 31 mg/kg and/or total copper greater than 16 mg/kg. At locations where shale and/or bedrock were encountered, sample data was not generated.

Following excavation of the south creek section, the concentration of total lead and copper in the sediments continued to exceed the cleanup goals. Confirmation sample results indicated total lead levels ranging from 21 to 58 mg/kg and copper levels ranging from 21 to 60 mg/kg. Therefore, background samples were collected to verify background levels of lead and copper in upstream sections of the creek. To investigate the concentrations, a total of four samples were collected up to 200 ft upstream of the south creek excavation section (Stations 12+00, 12+50, 13+00, and 13+50). In addition, a total of 12 samples were collected from the center of the creek (Station 11+45) to a distance 24 ft east. Based on the data received from background sampling, total lead levels ranged between 24 and 60 mg/kg (verses cleanup goal of 31 mg/kg), and copper levels ranged between 30 and 45 mg/kg (verses cleanup goal of 16 mg/kg). This data was presented to NYSDEC on 19 June 2000, to demonstrate that the confirmatory sample results for total lead and copper in the excavation area were similar to or less than the concentrations found in native soils in the underlying banks. Since all sediment was removed to shale at the bottom of the creek and to native soils along the sidewalls, NYSDEC approved the sediment removal of the south transect in accordance with the Record of Decision (ROD) objectives via a letter dated 26 September 2001.

The north creek section was excavated to bedrock and sidewalls were excavated to native soils. No additional samples were collected along the bottom. No further action is recommended in the north section consistent with the south section data.

5.4 SEDIMENT CHARACTERIZATION AND DISPOSAL

Creek sediments were transported to the Case II soil stockpile, dewatered, characterized, and transported off-site as Subtitle D Non-Hazardous material. All shipping papers, manifests, and the transportation and disposal certifications, permits, and insurance documents are on file and available upon request.

SECTION 6

SOIL CHARACTERIZATION, STABILIZATION, AND DISPOSAL

6. SOIL CHARACTERIZATION, STABILIZATION, AND DISPOSAL

6.1 SOIL CHARACTERIZATION

Each truckload of soil delivered to the stockpile staging area (Case I, II, and Case III material) was pushed with a dozer into an initial stockpile for characterization sampling. The stockpile was divided into 200 cy segments and sampled. The stockpile characterization samples were collected at least 18 inches below the surface at a frequency of one 5-point composite sample every 200 cy. All samples were sent to an off-site laboratory for TCLP metals analysis (Case I and II soils) and for total lead (Case III soils).

After stockpile characterization sampling, the Case I soils containing TCLP lead concentrations greater than 5 milligrams per liter (mg/L) were consolidated for on-site stabilization prior to disposal, while the Case II soils containing TCLP lead concentrations less than 5 mg/L were consolidated for off-site disposal without stabilization. The Case III soil (24,253 cy) was segregated into a separate pile (for future use by SEDA).

6.1.1 Bench-scale test

A bench-scale test for the stabilization process was conducted by the IT Group between 27 March 2000 and 31 March 2000 using both untreated and treated soil. The results from this test demonstrated that soils failing the TCLP analysis could be treated using a 2% by weight mixture of Triple Super Phosphate (TSP) manufactured by CF Industries, Incorporated. Application of TSP reduced TCLP lead concentrations to below the regulatory limit of 5 mg/L. Samples from the initial 200 cy of soil used for the bench scale verification were analyzed for the following TCLP metals: arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, antimony, beryllium, nickel, thallium, vanadium and zinc.

In conjunction with the bench-scale test, WESTON performed an independent soil stabilization test on 4 April 2000, using samples collected from lead-impacted soils previously stockpiled on-site. Results of this test confirmed the effectiveness of the TSP application for stabilization of the lead-impacted soils.

6.1.2 Full Scale Soil Stabilization

Full-scale soil stabilization was conducted between 5 June 2000 and 4 June 2002. Approximately 48,329 tons of soil was successfully treated using TSP to achieve the regulatory limit of 5 mg/L for TCLP lead. The quantity of soil that required stabilization exceeded the initial target quantity identified in *Section C Technical Specifications* (Parsons, 1998) by approximately 25,500 tons. Procedures for the full-scale soil stabilization process are summarized below.

A CAT D7R LGP Dozer with disc attachment transported the soil to a staging area adjacent to the loading pad where a CAT 330B L Excavator was used to load the untreated soil into a Commander 510 Power Screen hopper (beginning of the stabilization process). The Power Screen hopper shredded and deposited untreated soil into a Kolberg Model No. 52 Pug Mill where the soil was weighed prior to addition of the TSP mixture. The TSP stabilizer mixture was added to the Pug Mill through one of two 300 Barrel Silos. Both of the 300 Barrel Silos were equipped with a Flow-Way Flow Meter that verified the correct ratio of TSP applied to the untreated soil. The default application rate of TSP (by weight) was initially set at 2%, but it was determined that an application rate of 1.6% TSP was sufficient to achieve the cleanup criteria. As a result, the application rate of TSP was reduced from 2% to 1.6% accordingly. The treated soil was deposited onto belt conveyors for stockpiling. The west side of the stockpile area (approximately 100 ft by 400 ft) was used for temporary staging and as a loading area for transportation and disposal activities. The CAT D7R LGP Dozer periodically stockpiled the treated soil, which was discharged from the conveyors for sampling purposes. The temporary staging area was maintained to characterize soils in 200 cy and 2,000 cy increments.

Between 3 June 2002 and 4 June 2002, soil stabilization was conducted without the pug mill process. Instead, a 2% by weight application of TSP was applied to the lead-impacted soils by spreading the mixture over an area of approximately 150 ft by 230 ft. The soil was stabilized in 6-inch lifts using the appropriate amount of TSP for each lift based on 2% TSP by weight. Once the TSP was spread over the area, a tractor with disc attachment was used to thoroughly mix the TSP in the soil. As each 6-inch lift of soil was stabilized, a bulldozer removed the soil and transported it to a treated soil stockpile for characterization sampling. A total of four 6-inch

layers (approximately 1,597 tons of soil) were stabilized using this method prior to the soil being disposed of off-site.

6.1.3 Disposal Characterization Sampling

Soil that contained greater than 500 mg/kg of total lead, but passed the TCLP lead criteria of 5 mg/L was characterized for disposal using the following procedure.

- One 5-point composite sample was collected to represent the entire stockpile and analyzed for the full-suite of TCLP analytes (metals, semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), pesticides, and herbicides). The sample was also analyzed for the following non-TCLP analyses: ignitability, reactivity, corrosivity, percent moisture, pH, explosives, paint filter, VOCs, SVOCs, Target Analyte List metals, pesticides, and polychlorinated biphenyls.
- Following characterization of the initial stockpile, additional characterization samples were collected at a frequency of one 5-point composite sample per 2,000 cy to ensure the initial soil profile did not change. These samples were analyzed for the full suite of TCLP analytes (metals, SVOCs, VOCs, pesticides, and herbicides). The results from these analyses were submitted to the disposal facilities.

Soils containing lead concentrations greater than 500 mg/kg (and failing TCLP lead criteria of 5 mg/l) were stabilized as previously described, and then sampled for waste characterization and disposal. Except as noted, soil stabilization samples were collected in the same manner as described for the untreated soils.

6.2 TRANSPORTATION AND DISPOSAL

Off-site transportation and disposal was performed on all soil exhibiting lead concentrations greater than or equal to 500 mg/kg (based on characterization data). Soil with lead concentrations greater than or equal to 500 mg/kg and passing TCLP metals were disposed of off-site as Subtitle D Non-Hazardous material without further treatment or handling. Soil with lead concentrations greater than or equal to 500 mg/kg and failing TCLP metals were stabilized using TSP prior to off-site disposal as Subtitle D Non-Hazardous material. All Case III stockpile material was stockpiled in the Case III staging area (24,253 cy).

Transportation and off-site disposal of untreated soil passing TCLP criteria was conducted 21 January 2000 through 14 March 2000. Approximately 2,855 tons of soil was disposed of at the High Acres Landfill in Fairport, NY, and approximately 4,109 tons of soil was disposed of at the Hyland Ash Landfill in Angelica, NY. Off-site transportation of the soils was performed by Buffalo Fuel Corporation, Lott Motor Lines, and Zoladz Construction. This soil was disposed of as beneficial reuse material.

Transportation and off-site disposal of treated (stabilized) soil passing TCLP criteria was conducted between 27 June 2000 and 8 August 2002. Approximately 42,999 tons of stabilized soil was disposed of at the BFI Waste Systems of North America, Inc. Niagara Falls Landfill in Niagara Falls, NY, and approximately 7,437 tons of stabilized soil was disposed of at the Hyland Ash Landfill. Off-site transportation of the soil was performed by Lott Motor Lines, Zoladz Construction, Haseley Trucking Company, Inc., Mix Brothers, Inc., Sunshine Bulk Commodities, Inc., and Riccelli Enterprises. Waste tracking information for all soil disposed of off-site is presented in Appendix A. This tracking table includes a description of the waste stream, sample ID (if applicable), transport dates, waste code descriptions, manifest numbers, transporters, disposal facility(s), and load weights.

SECTION 7

WASTEWATER COLLECTION, TREATMENT, AND DISPOSAL

7. WASTEWATER COLLECTION, TREATMENT, AND DISPOSAL

WESTON generated wastewater from multiple activities during the remediation of the OB Grounds. This included wastewater collected from dewatering operations during burn pad excavations, wastewater from creek excavations (following diversion of the Creek), wastewater from decontamination activities, and stormwater from stockpile runoff (within the Case I and II staging area). Water generated from excavation dewatering was pumped from the excavation areas into tanker trucks and transported to one of two 155,000 gallon Modutanks for temporary storage prior to treatment and/or disposal.

Data obtained from the RI/FS indicated that wastewater generated in association with the OB Grounds remediation would meet NYSDEC Class D surface water discharge criteria via filtration; however, the State Pollutant Discharge Elimination System Permit issued by NYSDEC for this project required discharge water to meet Class C surface water discharge criteria instead. Although NYSDEC issued a letter approving a revised effluent concentration for iron of 0.7 mg/L on 16 November 1999, results from the filtration system pilot test indicated that a filtration system would not remove contaminants to the levels required in the permit. As a result, all wastewater collected throughout implementation of the project was transported off-site for treatment/disposal.

Following approval from NYSDEC, wastewater was pumped from the modutanks into tanker trucks to two off-site locations. Approximately 212,700 gallons of wastewater was sent to the SEDA wastewater treatment plant and approximately 70,600 gallons of wastewater was sent to the Ithaca Area Wastewater Treatment Plant.

SECTION 8

SITE RESTORATION

8. SITE RESTORATION

Restoration activities began on 27 April 2004 following completion of site remediation activities within the OB Grounds. To complete restoration activities, an excavator, two bulldozers, one haul truck, two farm tractors, one front-end loader, a chisel plow, and disc plow were mobilized. Restoration activities included the following:

- Rough grading the Site to remove oversized debris.
- Placing approximately 6,000 cy of on-site backfill (soil containing less than 60 mg/kg of lead) within grids containing soil > 60 mg/kg lead.
- Importing an additional 5,000 cy of topsoil (confirmed to contain less than 60 mg/kg of lead) for placement in 25 (125 ft by 125 ft) grids to achieve a 9-inch thick cover layer.
- Fine grading, seeding, and fertilizing all accessible areas within the OB Grounds.
- Grading, seeding, and fertilizing the 1-ft cut stockpile.

All seed placed on-site consisted of a mixture of 40% Tall Fescue, 30% Creeping Red Fescue, and 30% Perennial Rye. It is noted that all excavated soil that was reused on-site as backfill material was cleared of all munitions and explosives of concern, and passed both WESTON's QC and Government QA inspections.

Restoration activities outside the OB Grounds included the following:

- Removal of silt fence from the banks of Reeder Creek, the decontamination area, the access road to the OB Grounds, and the staging areas.
- Grading, applying 9 inches of soil cover, seeding, and fertilizing the Case III stockpile.
- Re-grading the haul road and repairing rutted areas.
- Removing the plywood wall sections of the decontamination pad.
- Removing all stumps and brush generated from clearing and grubbing activities in the stockpile staging area.

SECTION 9

DEMOBILIZATION

9. DEMOBILIZATION

WESTON demobilized equipment and materials in May 2004 following completion of site restoration activities. Although WESTON cleared the OB Grounds of all equipment and materials, temporary structures such as the decontamination pad, the modutanks, and the staging area were left per USACE request to assist SEDA on future base-supported projects. The Post Gate No. 2 office was demobilized, and all government property was locked in one storage container.

SECTION 10

CONCLUSION

10. CONCLUSION

This report documents completion of the soil and sediment remediation at the OB Grounds in accordance with WESTON's *Revised Draft Work Plan* dated April 1999, Parsons' *Section C - Technical Specifications* dated August 1998, and the ROD document. The primary activities completed by WESTON to achieve the remediation objectives for the Site included excavation and disposal of soils with concentrations of lead greater than 500 mg/kg, removal of sediment from Reeder Creek in areas adjacent to the OB Grounds, application of 9 inches of clean soil cover to areas where lead concentrations exceed 60 mg/kg, and establishment of a vegetative cover to prevent soil erosion.

Following a review of the confirmatory soil sample results, it is concluded that the horizontal and vertical extents of lead in soil at the burn pad locations has been sufficiently delineated and removed from the OB Grounds to below 60 mg/kg (20.6 mg/kg average). In addition, all adjacent surface soils (within the 1-ft cut and site perimeter) have been reduced to below 500 mg/kg (89.6 mg/kg average). Combined, the burn pad, 1-ft cut, and site perimeter total lead average is 55.1 mg/kg (based on 274 samples).

A total of approximately 2300 cy of sediment from Reeder Creek was removed and disposed of off-site, 32 monitoring wells were decommissioned, approximately 50,426 tons of soil were stabilized on-site prior to off-site disposal, and approximately 57,424 tons of soil was disposed of as RCRA Subtitle D Non-Hazardous soil at an approved facility.

A total of 25 grids encompassing an area of approximately 7 acres were backfilled to a depth of 9 inches using excavated soils containing less than 60 mg/kg total lead. All accessible areas of the OB Grounds were fine-graded and seeded.

Based on the data for soil and sediment remediation, it is recommended that USACE, SEDA, NYSDEC, and the U.S. Environmental Protection Agency evaluate this Site for closure and/or transfer status.
