SUBJECT: Draft Final 2010 Long-Term Monitoring Annual Report for the Open Burning (OB) Grounds and Army Response to EPA Comments on the Draft 2010 Long-Term Monitoring Annual Report for the Open Burning (OB) Grounds, Seneca Army Depot Activity; Contract W912DY-08-D-0003, Task Order 0008

Dear Mr. Nohrstedt:

Parsons Infrastructure & Technology Group Inc. (Parsons) is pleased to submit the Draft Final 2010 Long-Term Monitoring Annual Report for the Open Burning (OB) Grounds (SEAD-23) at Seneca Army Depot Activity (SEDA) in Romulus, Seneca County, New York. In addition, please find copies of the Army's Response to EPA Comments, dated February 11, 2011 on the Draft 2010 Long-Term Monitoring Annual Report for the Open Burning Grounds. This work was performed in accordance with the Scope of Work for Task Order 0008 under Contract No. W912DY-08-D-0003. This report provides a review of long-term monitoring completed during 2010 and provides recommendations for future long-term monitoring at SEAD-23.

Parsons appreciates the opportunity to provide you with the Annual Report for this work. Should you have any questions, please do not hesitate to call me at (617) 449-1405 to discuss them.

Sincerely,

Todd Heino, P.E.
Program Manager

1.0 INTRODUCTION

This Annual Report provides a review of long-term monitoring (LTM) conducted during the past year (2010) for the Open Burning (OB) Grounds located at the Seneca Army Depot Activity (SEDA or the Depot) in Seneca County, New York. The LTM for the OB Grounds includes annual collection and analysis of groundwater samples for lead and copper, the inspection of the vegetated, compacted soil cover that has been constructed over lead contaminated soil that is interred at the site, and the inspection of Reeder Creek along the length where it abuts the OB Grounds for evidence of inward migration and redeposition of soil from the area of the OB Grounds. This report presents and summarizes the results of the most recent annual LTM event and provides recommendations for future long-term monitoring at OB Grounds.

Long-term monitoring is an integral component of the approved remedy implemented at the OB Grounds. The “Record of Decision (ROD) Former Open Burning Grounds Site, Final” (Parsons, 1999) indicated that monitoring of groundwater and the vegetated soil cover at the OB Grounds, and of the sediment within Reeder Creek was required. Specifically, the ROD required:

- Periodic monitoring of groundwater quality at the OB Grounds for lead and copper content;
- Periodic monitoring of the vegetated, compacted soil cover placed over the lead contaminated soil remaining at the OB Grounds to assess whether evidence of erosion or protective cover breaching were present, which could result in the potential migration of contaminated soil; and,
- Periodic monitoring of the sediment in Reeder Creek for lead and copper content.

The LTM that is being conducted at the OB Grounds is being performed in accordance with the “Long-Term Monitoring Plan for the Open Burning Grounds, Final” (LTM Plan) (Parsons, 2007). The collection of groundwater quality data is needed to monitor the effectiveness of the implemented remedy at the site for preventing future impacts to groundwater at the OB Grounds and to sediments in Reeder Creek. Additionally, monitoring of the vegetated compacted soil cover placed over the buried soils at the OB Grounds is required to assure its long-term integrity and to prevent direct contact to, and incidental ingestion of, soils containing lead at concentrations up to 500 mg/kg by terrestrial wildlife at the site.

Part of the OB Grounds annual monitoring includes a qualitative assessment (i.e., visual inspection) for evidence of migration of material via surface water flow or groundwater transport of contaminants into the remediated section of Reeder Creek adjacent and downgradient to the OB Grounds. The visual inspection consists of walking the creek bed (or embankment) looking for evidence of soil erosion or sloughing from the OB Grounds side of the creek embankment and/or the accumulation of sediment along the stream bed. Groundwater transport of contaminants is monitored by the annual groundwater sampling of the OB Grounds wells. Presently quantitative monitoring of sediment

quality (i.e., submitting samples for analysis) is not included in the annual monitoring; the U.S. Army Corps of Engineers (Army), the U.S. Environmental Protection Agency (EPA), and the New York State Department of Environmental Conservation (NYSDEC) agreed that until such time as data indicating that either a groundwater pathway of contaminant flow or soil transport from the OB Grounds was occurring, sampling and analysis of creek sediments would not be required.

The overall objectives of the OB Grounds' LTM program is to monitor the effectiveness of the remedial actions completed at the site with respect to preventing future groundwater quality deterioration and the erosion or breaching of the vegetated, soil cover. The soil cover is intended to prevent incidental contact and ingestion of contaminated soil left buried at the site by indigenous terrestrial wildlife, and the potential mobilization and migration of lead contaminated soil interred beneath the cover. In addition to assessing the quality of site groundwater and the integrity of the cover, the results of the periodic monitoring will be used to assess the need for design and implementation of any sediment monitoring program that may subsequently be needed to assess potential OB Grounds impacts to the sediment quality found in Reeder Creek.

When the Army began LTM at the OB Grounds site, it was scheduled to occur on a quarterly basis. The first round of post-remedial action LTM was conducted between November 21, 2007 and November 28, 2007. The OB Grounds cover was first inspected on January 11, 2008. The results of the first LTM event were presented in a technical memo submitted on January 25, 2008. The second round of LTM sampling and cover inspections were completed between February 25, 2008 and February 26, 2008. The results of the second LTM event were presented in a technical memo submitted on May 19, 2008. The third round of LTM sampling and cover inspections were completed between May 20, 2008 and May 21, 2008. The results of the third monitoring event were presented in a technical memo submitted on September 16, 2008. The fourth round of groundwater sampling and cover inspections were completed between August 25, 2008 and August 26, 2008. The results of the fourth monitoring event were presented in a technical memo submitted on November 13, 2008.

The results of the first four LTM events were combined and summarized in the OB Grounds LTM Annual Report and Year One Review; this document was initially submitted as a draft in December 2008 and this document recommended changing the monitoring frequency from quarterly to an annual event. In February 2009, the Army received preliminary comments from the EPA that indicated that monitoring of Reeder Creek was required per terms of the OB Grounds ROD, and questioning why the results of such inspections had not been reported. The EPA also indicated that they did not concur with the Army's recommended change in monitoring frequency, and requesting that monitoring be conducted twice a year, once in the spring and again in the fall. NYSDEC provided additional comments on the draft report in March 2009, indicating that they also believed that inspection of Reeder Creek was required, but indicating that they had no objection to the decrease in monitoring frequency from quarterly to annual.

The Army authorized performance of a Reeder Creek inspection as a result of these comments, but this work was delayed until April 2009 when safe access could be gained into that portion of Reeder Creek that is adjacent to the OB Grounds. The observations and conclusions of this inspection were then appended to subsequent versions of the OB Grounds Report (i.e., draft final, final). However, resolution of the approved monitoring frequency was not finalized until February 2010, once the final OB Grounds Report was approved by the EPA and NYSDEC and all parties agreed to an annual monitoring event frequency. LTM of the OB Grounds was also disrupted due to the expiration of the Army's ordering period under the contracting vehicle used to perform the original work. Due to the uncertainty associated with the requirements and frequency of the monitoring, the Army could not program necessary funding and contract authorizations until an agreement was reached between all parties. The new contract vehicle and funding were awarded for the continuation of the work in May 2010, and the next round of LTM for the OB Grounds was performed between August 2 and August 5, 2010, approximately two years after the last groundwater and soil cap inspection. Inspection of Reeder Creek was also conducted during this event. The results of the fifth monitoring event are presented and discussed in this annual report.

2.0 SITE BACKGROUND

2.1 Site Description

SEDA is a 10,587-acre former military facility located in Seneca County in the towns of Varick and Romulus, New York, which was owned by the United States Government and operated by the Department of the Army between 1941 and 2000. In 2000, the Army closed the Depot and assumed a care-takers role over the property, pending the closeout of its continuing environmental obligations and the leasing or transfer of property to other public or private parties for beneficial reuse purposes. Since 2000, more than 8,250 acres of land have been transferred to other parties.

SEDA is located between Seneca Lake and Cayuga Lake and is bordered by sparsely populated farmland and New York State Highway 96 on the east, New York State Highway 96A on the west, and sparsely populated farmland on the north and south. The former OB Grounds is located in the northwestern portion of the Depot, as shown in **Figure 1**, where the planned future use of the land is currently designated for conservation purposes. The former OB Grounds site sits on gently sloping terrain as shown in **Figure 2**. As situated, OB Grounds sits a minimum of 1,780 feet away from the nearest SEDA boundary, which is located to the west of the area of concern (AOC). The OB Grounds is bounded on the east by Reeder Creek, which is a perennial creek that is generally less than 1 foot deep and eventually flows into Seneca Lake. The quality of surface water in Reeder Creek has been designated by the State of New York as a Class C water body (best usage of fresh water is fishing; the waters shall be suitable for fish propagation and survival). Seneca Lake is located approximately 10,000 feet west of the OB Grounds site and is used as a source of drinking water for numerous surrounding communities and the SEDA.

The OB Grounds is vegetated with grass and brush and there are no permanent structures within the area other than small concrete bunkers and a metal garage structure. The former Open Detonation Area (SEAD-45) is located immediately north of the OB Grounds, and the former Explosive Ordnance Disposal Area (SEAD-57) is located approximately 4,000 to 5,000 feet south of the former OB Grounds. A site plan of the former OB Grounds prior to the removal of contaminated soil is provided in **Figure 3**.

2.2 Site Hydrology

The stratigraphy of the OB Grounds generally consists of between 2 and 10 feet of glacially derived till below which is a zone of weathered bedrock. The depth to groundwater in the till/weathered shale aquifer varies seasonally between approximately 2 and 7 feet below the ground surface. Infiltration of precipitation is the sole source of groundwater for the overburden aquifer and the direction of the groundwater flow in the till/weathered shale aquifer at the OB Grounds is generally to the east towards Reeder Creek as shown in **Figure 3**.

Historic groundwater elevation monitoring in wells located at the OB Grounds prior to the remedial action indicated the presence of a groundwater divide near the western edge of the site. The approximate location of the apparent groundwater divide found in April 1993 is highlighted on **Figure 3** and represents a high point of the upgradient groundwater flow regime. The divide diverts a portion of the groundwater to the west, away from Reeder Creek, which lies to the east. Historic sampling results from wells located west of the identified divide suggest that the quality of groundwater has not been impacted by soils at the OB Grounds.

Pre-remedial action surface water drainage from the OB Grounds was primarily to the east-northeast via a series of man-made drainage ditches, culverts, and spillways to Reeder Creek. During the remedial action, many of the drainage ditches and culverts were destroyed or filled, altering the surface flow patterns. Additionally, the historic surface water spillways connecting the OB Grounds and Reeder Creek were plugged during the remedial action to prevent surface overflow to the creek.

Little of the current storm event runoff impacting the former OB Grounds reaches the creek via overland flow because it is captured in one of the numerous, localized topographic lows that are scattered throughout the former AOC. The topographic lows result from the soil removal and interment action performed at the AOC. The captured storm water subsequently infiltrates into the soil or evaporates.

2.3 Summary of the Remedial Action

The remedy specified in the ROD for the OB Grounds included:

- Removal of the berms surrounding the historic burn pads;
- Removal of at least 1-foot of all soils;
- Placement of a 9-inch vegetative cover over any soils with lead concentrations greater than 60 mg/kg, but less than or equal to 500 mg/kg;
- Excavation of sediments in Reeder Creek with elevated levels of copper or lead; and
- Implementation of a monitoring program for groundwater, sediment, and the capped areas.

The first four of these required remedial actions were conducted between June 1999 and May 2004. Groundwater monitoring at the site began in November 2007, and inspections of the cover began in January of 2008.

3.0 LONG-TERM GROUNDWATER MONITORING

Four rounds of sampling were conducted at the OB Grounds from November 2007 to August 2008 and reported in the Final OB Grounds Long-Term Monitoring Annual Report and One Year Review (Parsons, 2009). The first round was completed between November 21, 2007 and November 28, 2007. The second round was completed between February 25, 2008 and February 26, 2008. The third round was completed between May 20, 2008 and May 21, 2008. The fourth round was completed between August 25, 2008 and August 26, 2008. The fifth round of sampling was conducted between August 2, 2010 and August 3, 2010 and the results are presented in this report. Six monitoring wells (MW23-1, MW23-2, MW23-3, MW23-4, MW23-5, and MW23-6) that were installed in 2007 to replace the historic monitoring well network that existed at the site prior to the remedial action were sampled as part of these monitoring events.

OB Grounds groundwater samples were collected using low flow sampling techniques. Sampling procedures, sample handling and custody, holding times, and collection of field parameters were conducted in accordance with the "Final Sampling and Analysis Plan for Seneca Army Depot Activity (SAP)" (Parsons, 2005).

Groundwater samples and groundwater elevation measurements were collected from the six wells located at OB Grounds during each of the five monitoring events. Groundwater samples were collected and submitted to Columbia Analytical Services (CAS) in Rochester, New York for the analysis of total copper and total lead by USEPA SW846 Method 6010B¹. Analytical results reported for copper and lead were compared to site-specific action levels that are defined in **Table 1**.

In addition, the following geochemical parameters were measured and recorded in the field for each groundwater sample:

- pH
- Dissolved oxygen
- Temperature
- ORP
- Conductivity
- Turbidity

The pH, ORP, conductivity, and temperature of the groundwater were measured with a Horiba U-22 water quality meter, turbidity was measured with a LaMotto 2020 Turbidometer, and dissolved oxygen content was measured with an YSI 85 Dissolved Oxygen Meter. Data from the geochemical parameters were used to assess when the well was purged and stabilized adequately prior to sampling and to assess macro-groundwater quality.

3.1 Groundwater Elevations

Groundwater levels were recorded on November 20, 2007 (Round 1), February 25, 2008 (Round 2), May 20, 2008 (Round 3), August 25, 2008 (Round 4), and August 2, 2010 (Round 5). The

¹ Groundwater samples were analyzed by SW-846 6010B by Columbia Analytical Services Inc (CAS). CAS is currently not certified for the SW-846 6010C analysis method; and SW-846 6010C is presently not required by NYS. SW-846 6010C will be implemented in NYS April 1, 2011.

groundwater elevation range found during the five monitoring events is presented on **Table 2**. **Appendix A** provides the Round 5 field form documenting groundwater elevations prior to the collection of groundwater samples at this site. The missing well cap for MW23-5 was located on the ground adjacent to the well and was re-installed. The current OB Grounds monitoring well network provides insufficient data to develop current day groundwater contours with the level of detail that was provided by the pre-remedial action well network. However, the available current day groundwater data indicate an overall west-to-east, or possibly east-northeast, groundwater flow direction across the OB Grounds site, groundwater elevation data from the Round 5 (August 2010) monitoring event are shown superimposed over the April 1993 groundwater contours in **Figure 3**. Review of this figure and the new elevation data alone indicates that generally groundwater at the site moves west-to-east from wells MW23-5 and MW23-4 towards wells MW23-6, and then wells MW23-2, MW23-1, and MW23-3. There is also an indication that groundwater along the western side of the site may flow to the north, as the elevations observed at MW23-5 are higher than those recorded at MW23-4 during all five of the events (See **Table 2**). Along the eastern edge (Reeder Creek side) of the OB Grounds site, the groundwater elevations measured at MW23-2 in the center of the boundary, are always higher than those measured at MW23-1 and MW23-3. These data suggest some flow variations to the south and the north, away from the west-to-east prevailing flow direction. However, when the new data are evaluated with consideration of the April 1993 contours, the continuing presence of the apparent groundwater divide in the western portion of the site can not be ruled out.

Further, evaluation of the new groundwater elevation data indicates that all of the highest elevations were found during the Round 2 (February 2008) monitoring event, with five of the six wells (all except MW23-4) reaching their lowest elevations during the Round 4 (August 2008) event. The lowest groundwater level measured at MW23-4 was recorded during the Round 1 (November 2007) event.

3.2 Analytical Data

The groundwater results are presented in **Table 3**, where they are compared to the groundwater cleanup goals listed in **Table 1**. Field forms documenting the collection of groundwater during Round 5 at this site are provided in **Appendix A**. Generally, neither total copper nor total lead has been detected in any of the six wells during the five post-remedial action monitoring events. Four exceptions to this general trend exist, each for measured lead concentrations: Round 2, MW23-4 (5.4 ug/L); and Round 5, MW23-4 (2.7 J ug/L), MW23-5 (2.4 J ug/L), and MW23-6 (3.6 J ug/L). Each of these levels is below the groundwater cleanup goal of 15 ug/L. Chemical specific detection limits for both copper and lead were below action levels.

The LTM data support that groundwater at the site has not been impacted above action levels by residual levels of copper that remain in the soils at the site. The recent detection of lead in wells MW23-4, MW23-5, and MW23-6 at levels below cleanup goals suggests that further monitoring is warranted to assess future trends for lead. The detection in MW23-4 is the second time lead has been

found in this well since the beginning of LTM and is suspect because the data is reported as “estimated”. The detection in MW23-5 is suspect since lead was detected at an estimated concentration in the duplicate sample; but was not found in the parent sample. The detection in MW23-6 is the first time lead has been found in this well since the beginning of LTM and is suspect because the data is reported as “estimated”. Prior to the remedial action, lead was sporadically found in groundwater wells located at the OB Grounds; but since the remedial action, lead was only been detected once during the first four LTM sampling events before being found in three separate wells during the most recent sampling (Round 5) event. Again, each of these wells contained lead at concentrations below the established cleanup goal, and none of these wells are located adjacent to Reeder Creek suggesting that lead has not been released from the site to the creek. Two of the affected wells are located beyond the suspected groundwater divide that lies along the western edge of the former OB Grounds site, while the third (MW23-6) is located at a location believed to be side-gradient to the OB Grounds site. Groundwater pH levels measured in the three affected wells during the Round 5 event showed very weak acidic to weak basic (initial pH levels of 6.2 or higher rising to a pH level of greater than 7.0 prior to sampling) which suggests that lead should not be especially mobile.

Figure 5 through **Figure 10** present a summary of the groundwater sampling results for monitoring wells MW23-1 through MW23-6 from all the monitoring events conducted since the remedial action was completed (November 2007, February 2008, May 2008, August 2008, and August 2010). As may be noted from a review of these figures, neither copper nor lead has been detected above the groundwater cleanup goals in any of the wells sampled during any of the monitoring events.

4.0 SOIL COVER INSPECTION

The cover inspection consisted of documenting observations of the 25, 125- by 125-foot grids, where soils with residual lead concentrations between 60 mg/Kg and 500 mg/Kg were interred under a 9-inch soil cover. The locations of the grids are shown on **Figure 11**, which is a figure that was originally produced by Weston Solutions in the 2005 “Completion Report for the Open Burning Grounds Soil and Sediment Remediation” (Weston Solutions, 2005). The original map has been overlain on a recent aerial image of the OB Grounds obtained from Bing.com to help field inspectors more accurately orient where the interred soil areas are located; this presentation is provided as **Figure 12**. Cover inspections were completed on January 10, February 25, May 20, and August 25, 2008 and August 5, 2010, without the benefit of this figure. Observations from the August 2010 inspection have been updated in this report to reflect the current understanding of where interred soil resides. Observations made during the August 2008 and August 2010 cover inspections are noted below.

A cover inspection log for all five monitoring events is provided in **Table 4**. Inspection forms documenting the Round 5 soil cover inspection at this site are provided in **Appendix A**.

4.1 August 2008

Minimal erosion and a lack of animal burrowing activity were observed in the capped areas. At Grid Cell R8, a mouse hole approximately 6 inches wide and approximately 6 inches deep was observed. The mouse hole was repaired in August 2008.

4.2 August 2010

A lack of animal burrowing activity was observed in all of the capped areas. Minor erosion was observed in Grid Cell J8, adjacent to the location where a buried pipe runs beneath one of the site roads to allow surface water run-off to flow from the western portion of the site towards Reeder Creek. The noted erosion is on the northern side of the flow channel and affects vegetated soil that is outside of areas where the contaminated soil was interred on the southern side of the drainage channel. The condition of this location will be reassessed during the next inspection event to determine if corrective measures are needed.

More significant evidence of erosion was noted in Grid Cell L7 where a portion of the access road that leads past former Burn Pad B and Burn Pad C has apparently been overtopped by the water which has cut an erosion channel through the road allowing runoff to spill into the area of the former Burn Pad C. Erosion in this location, incorrectly referenced to Grid Cell L8 in 2008, was previously noted during the January and May 2008 inspections, but was repaired by the Army and was not observed in August 2008. This erosion channel is outside of the area where lead contaminated soil is interred beneath clean soil, and thus the Army currently does not intend to make repairs. This site

will be reassessed during future inspections and if conditions appear to be worsening, corrective measures may be implemented.

The drainage cut that was constructed along the southern side of the former OB Grounds as part of the remedial action to promote drainage of the accumulated water in the area located between the former site of the former Burn Pad G, the southern access road, and the southern bound of the OB Grounds site in Grid Cells I4 and I5 was also inspected during the site inspection. There were no obvious signs of erosion along its length, it was surrounded and covered with vegetation, and the underlying soil showed signs of cracking at numerous locations suggesting that it may have been dry for an extended period of time.

All of the features discussed above are labeled and shown in an aerial photograph of the OB Grounds site, that focuses on the area beginning in the vicinity of the southeastern corner of Grid Cell P4 (upper left hand corner of aerial), proceeding north-northeasterly (downward) to the approximate midpoint of Grid Cell R10, then proceeding westerly (right) to the approximate midpoint of Grid Cell H9 and finally proceeding south (up) to the southwestern corner of Grid Cell H4 is provided as **Figure 13**.

Soil erosion was observed on the east side of the paved access road leading into the OB Grounds (southeastern corner of Grid Cell S10). This location is not associated with any of the lead contaminated soil that has been interred at the site under the 9-inch soil cover. The noted erosion undermined the paved surface, along the eastern side of the road to a point where future vehicular access into the OB Grounds was being threatened. The Army retained a contractor to reconstruct the culvert and the roadway in September, 2010, and accepted the work as completed. This location will be reassessed during the next inspection tour of the site.

5.0 REEDER CREEK INSPECTION

Accessible portions of Reeder Creek adjacent to the OB Grounds were inspected by walking along the creek bed and making observations of the creek bottom and the side walls. Access to all portions of the creek was not possible due to water depths greater than 2 to 3 feet in the area upgradient of MW23-3 and the absence of any walk surface adjacent to the steep, earthen sidewalls of the creek. Non-accessible portions of Reeder Creek were viewed from locations where access from the higher OB Grounds site could be gained down stable pathways located in the side wall.

5.1 April 2009

The Army performed a visual inspection of the Reeder Creek streambed in April of 2009 at locations adjacent to the OB Grounds. This inspection indicated that surface water flow within Reeder Creek had continued to scour the bedrock surface, and had limited and for the most part precluded, the redeposition of sediment adjacent to the OB Grounds. Soil sloughing from upland surfaces bordering both edges of the creek is observed at many locations along the creek bed; however, these are only noted at places where the creek's course broadens and where the wetted watercourse represents but a portion of the entire creek bed's width. There is no evidence that the sloughed soil has migrated into, and deposited as sediment within, the main flow channel of Reeder Creek.

Examination of the spillways where surface water from the OB Grounds to Reeder Creek previously flowed into the creek, but which were closed as part of the overall OB Grounds remedial action, indicated that there was no visible evidence that overland surface water flow had transported soils from the OB Grounds into Reeder Creek. The spillways, which are shale based, were free of any accumulation of excessive debris and soil. Field observations also noted that the mechanisms that were placed at the OB Grounds to prevent surface water flow from entering the spillways were still evident and working.

5.2 August 2010

A visual inspection of the Reeder Creek streambed was conducted on August 5, 2010 at locations adjacent, downgradient, and upgradient to the OB Grounds. Locations downgradient and adjacent to the OB Grounds consisted of exposed bedrock streambeds with no observable sediment. The majority of the Reeder Creek streambed from OD Grounds to upgradient of OB Grounds was walked using the appropriate health and safety equipment; areas that were deeper than 2 feet or where vegetation prevented access were observed from the creek banks.

Sediment was not observed in the low spots of the bedrock streambed in either the downgradient or adjacent portions of Reeder Creek to the OB Grounds. However, a thin brown slim-like material measuring only a few millimeters thick was observed in various segments of the creek in areas where the water was deeper than 6 inches. These locations were typically associated with downstream bedrock outcrops which allow the creek water to pool until it exceeds the height of the outcrop and

then flow over the top of the outcrop; the brown material was not observed beyond the outcrop overflow points. Sediment was observed upgradient of the OB Grounds in areas that were outside the prior creek bed excavation areas.

The banks of Reeder Creek were inspected for evidence of material collapsing into the creek. With the exception of the erosion point that is located along the eastern edge of the OB/OD Grounds access road in Grid Cell S10, no other locations of soil erosion were noted on the southwest side of Reeder Creek (OB Grounds side). Erosion in Grid Cell S10 is due to the undermining of the paved access road; this material's source is from the subgrade to the paved access road and is not from the OB Grounds soil cover. The northeast bank of Reeder Creek (non OB Grounds side) generally exhibited similar conditions as the southwest bank, although several locations where deer trails descend the creek bank had visible signs of sidewall material collapse, migration, and accumulation down in the creek bed. These locations appeared to be solely related to deer activity and not from surface water run-off.

Appendix B provides a scan of the Log Book notes from August 5, 2010 Reeder Creek inspection and a transcript of the associated Log Book notes. Photos of Reeder Creek were taken to document the exposed bedrock streambed and creek banks current condition; **Figure 12** shows the locations photos were taken. Reeder Creek Photo #01 through Photo #06 are provided in **Appendix C**.

Photo #01 – Standing downgradient of MW23-3, looking up stream. Exposed bedrock creek bottom is visible. No sediment was observed.

Photo #02 – Standing parallel to MW23-3, looking up stream. This section of creek was greater than 2 feet deep. The creek bottom was competent bedrock with loose shale rocks scattered about. A brown slim/gelatinous like material, previously mentioned, was observed on top of the bedrock creek bottom in this section and a few localized spots where bedrock outcrops allow water to pool.

Photo #03 – Upgradient of MW23-3, looking down stream. This section of the creek was about 1 foot deep and the banks were heavily vegetated. The creek bottom was competent bedrock and the brown slim/gelatinous material was observed and appeared to be a few millimeters thick.

Photo #04 - Downgradient side of beaver dam and MW23-2, looking up stream. The area immediately downgradient of the beaver dam had an exposed bedrock creek bottom (not visible in photo). The brown slim/gelatinous material was observed between the exposed bedrock outcrop and the downgradient side of the beaver dam. Broken shale bits were observed on a deer trail accumulating on the northeast side of the creek (buffer area side) but had not migrated into the creek itself. The location of the beaver dam is marked on **Figure 12**.

Photo #05 - Upgradient side of beaver dam and parallel to MW23-2, looking down stream. The water was 2 to 3 feet deep in this section. The area upgradient of the beaver dam was not directly accessible due to thick vegetation along the creek bank. There was an access point about 150 feet upgradient of

the beaver dam due to the erosion on the northeast side of the paved access road. The paved access road's subgrade material is migrating down into the creek from surface water runoff erosion. The creek bottom could not be visually observed but a shovel was used to gauge the condition of the creek bottom; no sediment was observed. The creek bottom felt (striking with the shovel) like competent bedrock, and the brown slim/gelatinous material that was a few millimeters thick was observed on top of rocks examined from the creek bottom.

Photo #06 – Downgradient to MW23-1, looking up stream. Water was greater than 2 feet deep. The vantage point looking up stream was from the paved access road access point, where material from the roads subgrade was observed migrating into the creek. The left side of the photo (northeast bank/buffer area) had a couple locations where bank material was migrating down to the creek, and appeared to be associated with deer trail activity.

5.3 Inspection Observations

As is reported above, the groundwater data collected during historic sampling events as well as during the five rounds of the Long-Term Monitoring Program shows no evidence of the release of copper or lead from the OB Grounds. The prior soil cover inspections did reveal that occasional animal burrows and shallow erosion depressions were present in the cover at the contaminated soil burial areas, but none of the past noted burrow holes or depressions were sufficiently sized to allow buried soils to escape their containment. All of the noted holes and depressions were repaired in August 2008 as part of the Army's continuing maintenance activities. Other than the discussed location where material to the east of the access roadway had eroded and collapsed into the Reeder Creek (repaired September 3, 2010), there are no other visible signs that OB Grounds site soils are being released via overland flow to Reeder Creek. Soil from the location that had collapsed is not located near lead contaminated soil that was interred beneath the soil cover that was constructed during the remedial action, and there is no indication that soils from the west side of the access road have collapsed into the creek. As such, the Army does not see any evidence to suggest that a release of lead or copper above background levels is occurring from the OB Grounds site. The recent detections of lead in three wells (MW23-4, MW23-5, and MW23-6) below the action level were located on the western edge of the OB Grounds (MW23-4 and MW23-5) and south of the OB Grounds (MW23-6). The absence of detectable concentrations of lead and copper in the three wells (MW23-1, MW23-2, and MW23-3) immediately adjacent to Reeder Creek supports the observation that Reeder Creek has not been impacted by lead or copper.

Based on these data and this information, the Army has not conducted sediment sampling and analysis of Reeder Creek as part of the long-term monitoring at the OB Grounds. The Army will conduct another visual inspection of the creek bed and spillways connecting the OB Grounds to Reeder Creek during the next scheduled annual monitoring event, and if evidence of overland transport of soil or groundwater migration of contaminants from the OB Grounds to Reeder Creek is identified, a plan will be prepared and submitted for approval which will identify a sediment monitoring program that will be conducted.

6.0 LONG-TERM MONITORING CONCLUSIONS AND RECOMMENDATIONS

Based on the results of fifth round of LTM at the OB Grounds, the following conclusions have been reached:

- Residual lead and copper concentrations remaining in the soils have not impacted groundwater at, or in the immediate vicinity of, the site above the action levels;
- The integrity of the vegetated soil cover overlying interred contaminated soils at the site was intact and there was no evidence that terrestrial wildlife are exposed to the contaminated soils below the 9-inch cover;
- The washout area noted during in Grid Cell L7 in (identified as L8 in 2008 Report) during the February and May 2008 inspections is again evident in the August 2010 inspection. Information provided in Section 4.2 indicates that this is outside of areas where contaminated soils were interred beneath clean soil, so this area will not be repaired at this time by the Army. If the next inspection suggests that this area is enlarging, the Army will evaluate a more permanent repair;
- The Army will continue to monitor cover erosion, and note any instance of cover erosion or exposed native soil;
- Based on the groundwater data and the cover inspection, there is no evidence to suggest that the OB Grounds may be contributing to the degradation of sediment quality in Reeder Creek;
- Sediment deposition in Reeder Creek adjacent to the OB Grounds was not noted during the August 2010 inspection; and,
- The Army will continue to inspect Reeder Creek for evidence of sediment deposition and if it is observed, a sediment sampling and analysis program plan will be prepared, submitted for approval, and implemented for Reeder Creek at locations adjacent to the OB Grounds.

Based on the result of the LTM events conducted at the OB Grounds, the Army recommends continuing the monitoring frequency of once per year. As presented and summarized above, available monitoring data shows no evidence of lead or copper in the groundwater above the cleanup goals subsequent to the completion of the remedial action for the site. These findings are consistent with the groundwater sample results obtained during the remedial investigation stage (1990s) of work at the site, indicating that there is no evidence of groundwater quality deterioration over the past 15 years. Further, the annual inspections of the soil cover have shown minimal evidence of erosion or animal breaching of the protective soil cover. Additionally, the examination of spillways connecting the OB Grounds to Reeder Creek indicate that measures performed to eliminate overland surface water flow the OB Grounds to Reeder Creek continue to exist and have been effective, as there is no

indication that soil or debris from the OB Grounds is located in the spillways downgradient of the control measures. Finally, the inspections of Reeder Creek indicate that the bedrock that underlies the watercourse adjacent to the OB Grounds continues to be scoured by the perennial flow within the creek. There is no current indication that sediment is being redeposited at locations from which it was previously excavated. Therefore, due to the absence of any evidence that suggests contaminants of concern have been mobilized from the OB Grounds either via the groundwater or overland flow of storm-event waters, and due to the continued scouring of the creek bed by the perennial flow of water, there is no reason to develop or implement a sediment monitoring plan for Reeder Creek at this time.

The next LTM sampling, soil cover inspection, and Reeder Creek inspection events are scheduled to occur in August 2011. Results of the next year's monitoring efforts at the OB Grounds will be evaluated, and recommendations of necessary changes to the frequency or extent of monitoring will be made at that time. Subsequent rounds of LTM for the OB Grounds are expected to continue at yearly intervals thereafter, unless altered by mutual agreement of all parties.

Soil Cap Inspection Log
OB Grounds LTM 2010 Annual Report
Seneca Army Depot Activity

| Observations | | | | |
|--------------|---|--|----------------------------------|---|
| Grid # | Round 1 - January 2008 | Round 2 - February 2008 | Round 3 - May 2008 | Round 4 - August 2008 |
| S8 | Several 1" to 2" size mice holes were observed | No change | No change | No change |
| S8 | Several 1" to 2" size mice holes were observed on the ground surface. | No change | No change | No change |
| R8 | Several 1" to 2" size mice holes were observed on the ground surface. | No change | No change | A mouse hole approximately 6" wide and approximately 6" deep was observed. Hole was repaired August 2008. |
| Q8 | 2" mice hole was observed on the ground surface. | No change | No change | No change |
| Q8 | A cluster of 1" to 2" size mice holes was observed. | No change | No change | No change |
| P10 | A cluster of 1" to 2" size mice holes was observed. | No change | No change | No change |
| L9 | Two mice holes approximately 6" deep | No change | No change | No change |
| L9 | A mouse hole approximately 6" deep was observed | No change | No change | No change |
| L9 | A mouse hole approximately 6" deep and 6" diameter was observed | No change | No change | No change |
| L8 | Minor erosion along the edge of the soil cap from surface water flow. | Surface water runoff path forming. Repaired drainage path May 2008. | Repaired drainage path May 2008. | No change |
| I8 | A mouse hole about 2" to 3" in size was observed | Vegetation spotty, large amounts of surface soil exposed. Reseeded May 2008. | Reseeded May 2008. | No change |
| I8 | Minor erosion of the soil cap. | Surface water runoff path forming. Repaired drainage path May 2008. | Repaired drainage path May 2008. | No change |
| I6 | A cluster of 1" to 2" size mice holes was observed. | No change | No change | No change |
| J6 | 2" mice holes were observed on the ground surface. | Short surface water drainage path; native soil not visible. Repaired drainage path May 2008. | Repaired drainage path May 2008. | No change |
| H9 | Two mice 2" size holes was observed. | No change | No change | No change |
| D7 | Two mice 2" size holes was observed. | No change | No change | No change |
| B3 | A mouse hole approximately 6" wide and approximately 6" deep was observed | No change | No change | No change |

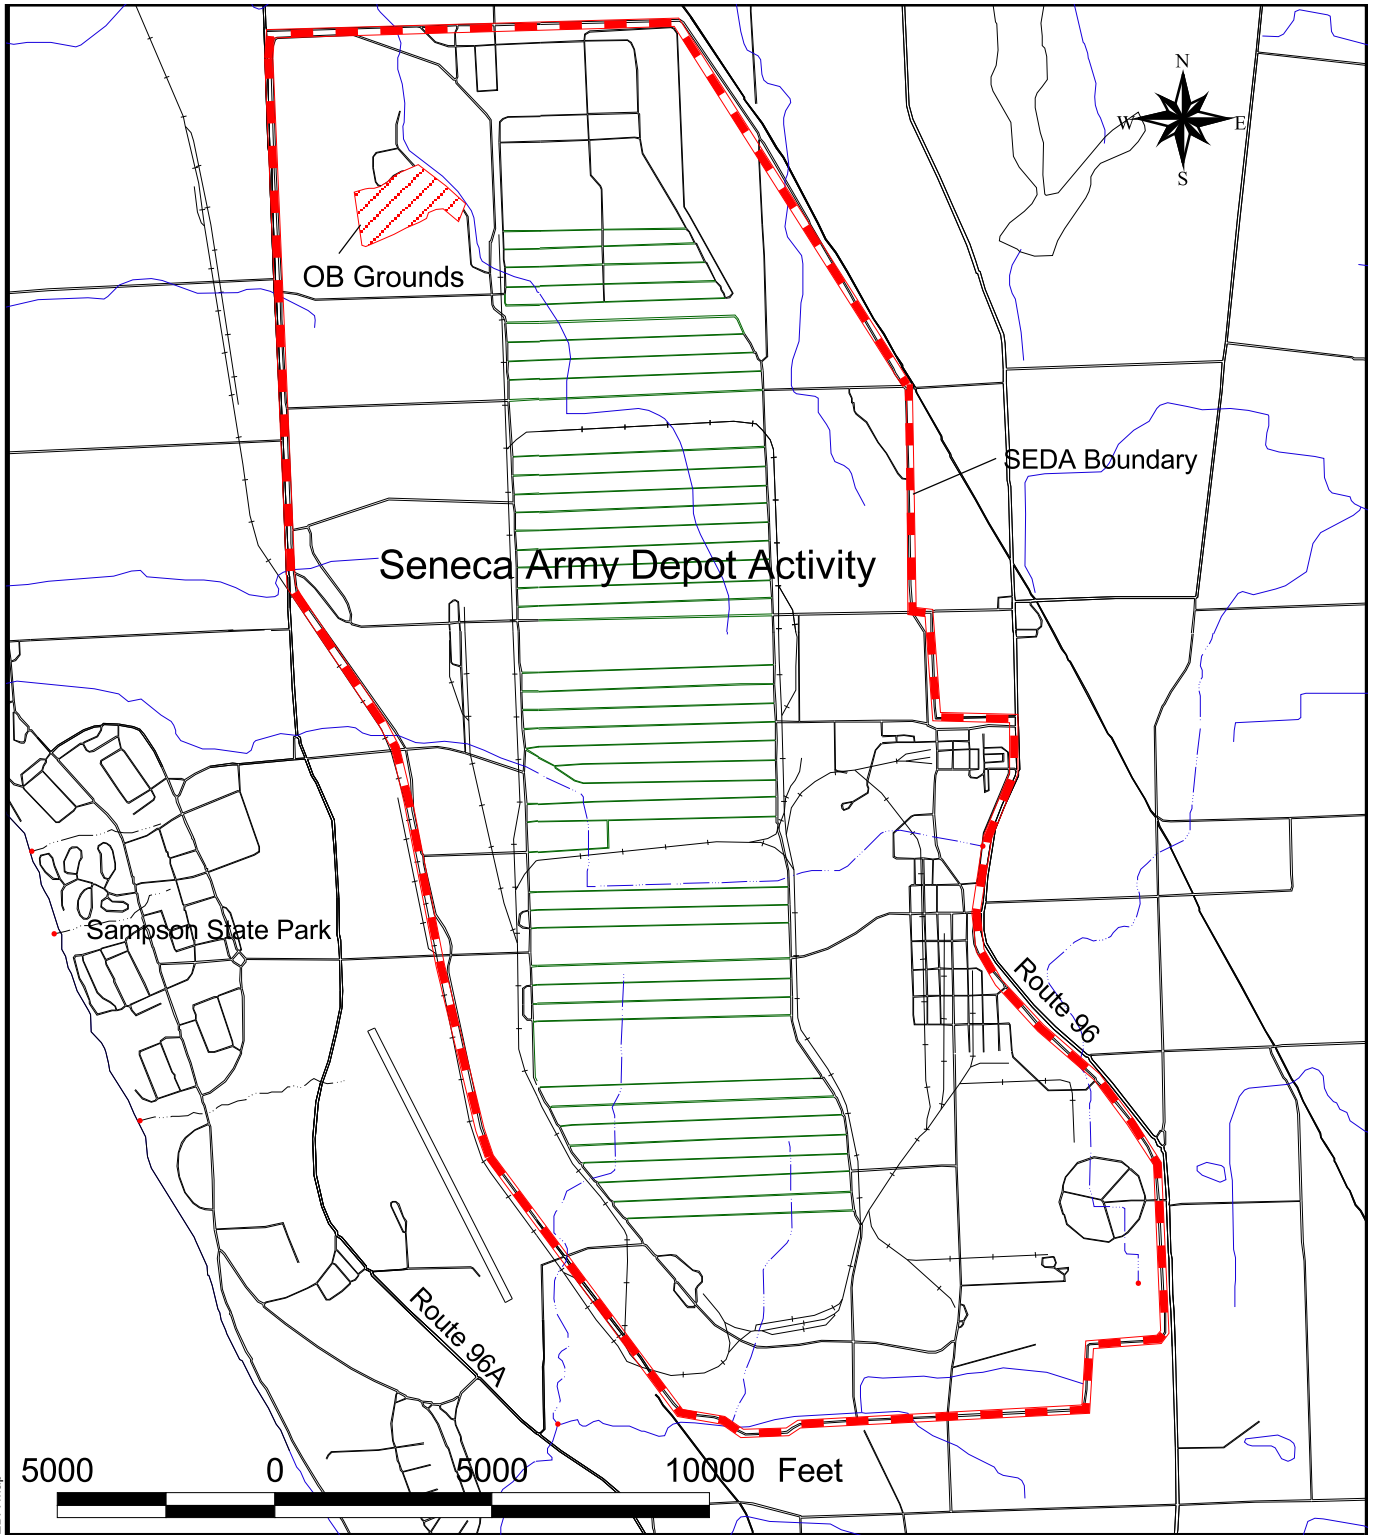

| Grid # | Round 5 - August 2010 |
|--------|--|
| S8 | No animal holes were observed. |
| S8 | No animal holes were observed. |
| R8 | No animal holes were observed. |
| Q8 | No animal holes were observed. |
| Q8 | No animal holes were observed. |
| P10 | No animal holes were observed. |
| L9 | No animal holes were observed. |
| L9 | No animal holes were observed. |
| L9 | No animal holes were observed. |
| L8 | Erosion of road area due to surface water flow. |
| J8 | Erosion along road edge due to surface water flow off of road surface. |
| J8 | Erosion around a culvert outlet due to surface water flow off of road surface. |
| I8 | No animal holes were observed. |
| I6 | No animal holes were observed. |
| J6 | No animal holes were observed. |
| H9 | No animal holes were observed. |
| D7 | No animal holes were observed. |
| B3 | No animal holes were observed. |

Notes:

1. All grids capped areas were inspected. Grids with no signs of erosion or other disturbances to the cover are not included in this log.
2. The Army repaired the washout areas noted above, and reseeded areas with sparse vegetation on or before May 22, 2008.

SENECA ARMY DEPOT
 OPEN BURNING GROUNDS
 LONG-TERM MONITORING REPORT

EPY ENVIRONMENTAL ENGINEERING, Inc. No. 745818-08000

FIGURE 10
 OPEN BURNING GROUNDS
 SOIL CAP AREAS AND WELL LOCATIONS

SCALE: 1" = 500' DATE: FEBRUARY 2008 REV: --

OB Grounds
Task Order #36
Round 2 Inspection

Date of Inspection: 8/5/2010

Weather Conditions: Sunny, mix of clouds, Temp low 80's, wind N→S scattered rain showers earlier this morning, now clear.

Observations should include assessment of integrity of 9-inch soil cap placed over residual lead contaminated soil in 25 125'x125' grids.

Assessment should be made with respect to caps ability to ensure that indigenous terrestrial wildlife are not exposed via direct dermal contact or incidental ingestion.

Note signs of erosion or animal burrowing to ensure underlying soils are not exposed to the environment.

| | Grid No. | Observations/Location of Disturbed Soils |

APPENDIX B

**LOG BOOK NOTES AND TRANSCRIPTS
OF REEDER CREEK INSPECTION**

8/5/10 82° F Mostly cloudy

for GW recharge.

Jeff A. may want us to stay extra night and check GW levels tomorrow morning and sample if possible.

1323 Arrived at OB Grounds to conduct soil cap inspection as Reader Creek inspection.

1450 Soil Cap inspection complete.

No animal holes were observed in any of inspected Grids.

→ The drainage cut in Grids H, I, J ^{DSB 8/5} ~~485~~ ⁴⁸⁵ that has previously been observed in soil cap inspections is still present. Cut is ~6-8 inches in depth. But no signs of recent runoff were observed.

→ Grid J8 has some surface water runoff erosion from road surface into low spot where water collects. Also observed was erosion adjacent to a

8/5/10

existing culvert pipe. Erosion appears to be due to surface water runoff.

→ Grid L8 still has drainage cut in road to allow water to drain from west side of road to the east. Cut has been observed in past inspection. But does not appear to have grown in size or depth.

1540 Complete Reader Creek inspection.

- started at North Tree line edge of the OD Grounds and walked upstream along the creek bed. → observed exposed bedrock shale at bottom of creek in numerous locations.

→ light brown color silt / thin sediment like material observed in area where the stream flow has pooled due to outcrops in the exposed bedrock. material is only a few millimeter thick and

8/5/10

surface beneath it appears to be competent bedrock (shale, → locations where the bedrock outcrop are exposed bedrock with no brown silt material present, probably due to the constant flowing water.

⇒ Exit Reeder Creek ~ 100 North of MW23-3. Beaver dam is located at about same location as MW23-1

⇒ Re-entered Reeder Creek near garage building ~ 150 ft South of Beaver dam, does appear to be same dam, but 300 ft S.

Exposed shale was visible however the water appears to be deeper than a foot. Brown silt / sediment like material is also present. Probably due to the Beaver dam preventing the normal stream flow.

⇒ Unable to gain access to creek area between MW23-1 and garage building due to steep drop off

8/5/10

and thick vegetation along the over looking bank.
→ was able to gain access to creek ~ 100 ft South of MW23-1. This area does not appear to have been part of the removal action. Bedrock is not visible and the creek bed has sediment / muddy creek bottom.

1614 Called Jeff Adams to report finding of Soil cap inspection and Reeder Creek Inspection. Photo documentation of creek was taken

1620 Depart OB Grounds for SEAD-25 to check GW recharge at wells.

1630 Arrived at 5-25.

| | | |
|--------|----------------------|---------------------|
| MW25-9 | 5.34' depth to water | <u>Time</u> 1635 |
|--------|----------------------|---------------------|

| | | |
|--------|----------------------|------|
| MW25-8 | 5.38' depth to water | 1636 |
|--------|----------------------|------|

1640 Returned to fuel office to pack samples for shipment.

Note: implied words or missing suffixes have been included in (###)

1540 – Completed Reeder Creek inspection

- Started at north tree line edge of the OD Grounds and walked upstream along the creek bed.
- Observed exposed bedrock shale at bottom of creek in numerous locations.
- Light brown color slim/thin sediment like material observed in area(s) where the stream flow has pooled due to outcrops in the exposed bedrock. Material is only a few millimeter thick and surface beneath it appears to be competent bedrock/shale.
- Locations where the bedrock outcrop are exposed(,) bedrock with no brown slim material present, probably due to the constant flowing water
- Exit Reeder Creek ~100 (ft) north of MW23-3. Beaver dam is located at about same location as MW23-1 (correction MW23-2)
- Re-entered Reeder Creek near garage building ~150 ft south of beaver dam, does not appear to be same dam (statement is incorrect, only a single beaver dam was observed). Exposed shale was visible however the water appears to be deeper than a foot. Brown slim/sediment like material is also present. Probably due to the beaver dam preventing the normal stream flow.
- Unable to gain access to creek area between MW23-1 and garage building due to steep drop off and thick vegetation along the overlooking bank (OB Grounds side of bank).
- Was able to gain access to creek ~100 ft south of MW23-1. This area does not appear to have been part of the removal action. Bedrock is not visible and the creek bed has sediment/muddy creek bottom.

LABORATORY REPORT

August 27, 2010

Service Request No: R1004141

Mr. Brendan Baranek-Olmstead
Parsons Engineering Science
100 High St. 4th Floor
Boston, MA 02110

Laboratory Results for: SEAD OB Grounds/747547-01100

Dear Mr. Baranek-Olmstead:

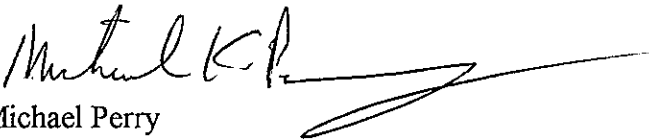

Enclosed are the results of the sample(s) submitted to our laboratory on August 4, 2010. For your reference, these analyses have been assigned our service request number **R1004141**.

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 129. You may also contact me via email at MPerry@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Michael Perry
Laboratory Manager

Page 1 of 22

COLUMBIA ANALYTICAL SERVICES, INC.

Client: Parsons Engineering Science
Project: SEAD OB Grounds
Sample Matrix: Water

Service Request No.: R1004141
Project No.: 747547-01100
Date Received: 8/04/10

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank, and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 8/03/10 and received at CAS on 8/04/10 in good condition at cooler temperature of 6 °C as noted on the cooler receipt and preservation check form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CAS CLP Batching sheets for a cross-reference between Client ID and CAS Job # and analyses requested.

Metals Analysis

Seven water samples were analyzed for Copper and Lead using SW-846 ICP method 6010B. The data between the MDL and the specified MRL has been flagged with a "J".

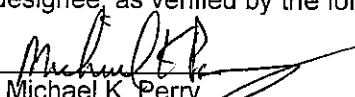

The initial and continuing calibration criteria were met for all analytes.

All blank spike (LCS) recoveries were within QC limits of 80 – 120 %.

The matrix spike and duplicate analysis was performed on sample OBLM20033, as requested. All Matrix Spike Recoveries were within QC limits of 75 – 125 %. The RPD were all within QC limits.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hard copy data package, has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Michael K. Perry
Laboratory Manager

Folder Comments:

REPORT QUALIFIERS

- U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
- J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Aroclors).
- B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
- E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
- E Organics- Concentration has exceeded the calibration range for that specific analysis.
- D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
- * Indicates that a quality control parameter has exceeded laboratory limits.
- # Spike was diluted out.
- + Correlation coefficient for MSA is <0.995.
- N Inorganics- Matrix spike recovery was outside laboratory limits.
- N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
- S Concentration has been determined using Method of Standard Additions (MSA).
- W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
- P Concentration >40% (25% for CLP) difference between the two GC columns.
- C Confirmed by GC/MS
- Q DoD reports: indicates a pesticide/Aroclor is not confirmed ($\geq 100\%$ Difference between two GC columns).
- X See Case Narrative for discussion.

CAS/Rochester Lab ID # for State Certifications¹

| | |
|---|-------------------------------|
| NELAP Accredited | Nevada ID # NY-00032 |

August 27, 2010

Service Request No: R1004141

Mr. Brendan Baranek-Olmstead
Parsons Engineering Science
100 High St. 4th Floor
Boston, MA 02110

Laboratory Results for: SEAD OB Grounds/747547-01100

Dear Mr. Baranek-Olmstead:

Enclosed are the results of the sample(s) submitted to our laboratory on August 4, 2010. For your reference, these analyses have been assigned our service request number **R1004141**.

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAP standards except as noted in the case narrative report. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 129. You may also contact me via email at MPerry@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Michael Perry
Laboratory Manager

SDG NARRATIVE

COLUMBIA ANALYTICAL SERVICES, INC.

Client: Parsons Engineering Science
Project: SEAD OB Grounds
Sample Matrix: Water

Service Request No.: R1004141
Project No.: 747547-01100
Date Received: 8/04/10

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank, and LCS results have been reported with each analytical test.

Sample Receipt

Water samples were collected on 8/03/10 and received at CAS on 8/04/10 in good condition at cooler temperature of 6 °C as noted on the cooler receipt and preservation check form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. See the CAS CLP Batching sheets for a cross-reference between Client ID and CAS Job # and analyses requested.

Metals Analysis

Seven water samples were analyzed for Copper and Lead using SW-846 ICP method 6010B. The data between the MDL and the specified MRL has been flagged with a "J".

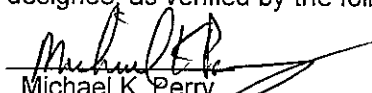

The initial and continuing calibration criteria were met for all analytes.

All blank spike (LCS) recoveries were within QC limits of 80 – 120 %.

The matrix spike and duplicate analysis was performed on sample OBLM20033, as requested. All Matrix Spike Recoveries were within QC limits of 75 – 125 %. The RPD were all within QC limits.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this hard copy data package, has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

Michael K. Perry
Laboratory Manager

Folder Comments:

REPORT QUALIFIERS

- U Analyte was analyzed for but not detected. The sample quantitation limit has been corrected for dilution and for percent moisture, unless otherwise noted in the case narrative.
- J Estimated value due to either being a Tentatively Identified Compound (TIC) or that the concentration is between the MRL and the MDL. Concentrations are not verified within the linear range of the calibration. For DoD: concentration >40% difference between two GC columns (pesticides/Aroclors).
- B Analyte was also detected in the associated method blank at a concentration that may have contributed to the sample result.
- E Inorganics- Concentration is estimated due to the serial dilution was outside control limits.
- E Organics- Concentration has exceeded the calibration range for that specific analysis.
- D Concentration is a result of a dilution, typically a secondary analysis of the sample due to exceeding the calibration range or that a surrogate has been diluted out of the sample and cannot be assessed.
- * Indicates that a quality control parameter has exceeded laboratory limits.
- # Spike was diluted out.
- + Correlation coefficient for MSA is <0.995.
- N Inorganics- Matrix spike recovery was outside laboratory limits.
- N Organics- Presumptive evidence of a compound (reported as a TIC) based on the MS library search.
- S Concentration has been determined using Method of Standard Additions (MSA).
- W Post-Digestion Spike recovery is outside control limits and the sample absorbance is <50% of the spike absorbance.
- P Concentration >40% (25% for CLP) difference between the two GC columns.
- C Confirmed by GC/MS
- Q DoD reports: indicates a pesticide/Aroclor is not confirmed ($\geq 100\%$ Difference between two GC columns).
- X See Case Narrative for discussion.

Cooler Receipt And Preservation Check Form

Project/Client Parsons - Science Center ^{8/14/10} ~~8/14/10~~ Submission Number R10-4141

Cooler received on 8/14/10 by: DPW COURIER: CAS UPS ~~REDEX~~ VELOCITY CLIENT

1. Were custody seals on outside of cooler? YES NO
2. Were custody papers properly filled out (ink, signed, etc.)? YES NO
3. Did all bottles arrive in good condition (unbroken)? YES NO
4. Did any VOA vials have significant* air bubbles? YES NO N/A
5. Were ~~Ice~~ or Ice packs present? YES NO
6. Where did the bottles originate? CAS/ROC, CLIENT
7. Temperature of cooler(s) upon receipt: 6.0°

Is the temperature within 0° - 6° C?: Yes Yes Yes Yes Yes
 If No, Explain Below No No No No No

Date/Time Temperatures Taken: 8/14/10/0946

Thermometer ID: IR GUN#3 / IR ~~GUN#4~~ Reading From: Temp Blank / Sample Bottle

If out of Temperature, note packing/ice condition, Client Approval to Run Samples: _____
 PC Secondary Review: MP 8/14/10

Cooler Breakdown: Date: 8/14/10 by: MWC

1. Were all bottle labels complete (i.e. analysis, preservation, etc.)? YES NO
 2. Did all bottle labels and tags agree with custody papers? YES NO
 3. Were correct containers used for the tests indicated? YES NO
 4. Air Samples: Cassettes / Tubes Intact Canisters Pressurized Tedlar® Bags Inflated N/A
- Explain any discrepancies: _____

| pH | Reagent | | | Lot Received | Exp | Sample ID | Vol. Added | Lot Added | Final pH |
|-----------------------|---|-----|----|---|------|---|------------|-----------|----------|
| | | YES | NO | | | | | | |
| ≥12 | NaOH | | | | | | | | |
| ≤2 | HNO ₃ | ✓ | | 80B2103H | 6/11 | | | | |
| ≤2 | H ₂ SO ₄ | | | | | | | | |
| Residual Chlorine (-) | For TCN and Phenol | | | If present, contact PM to add ascorbic acid | | | | | |
| | Na ₂ S ₂ O ₃ | - | - | | | *Not to be tested before analysis - pH tested and recorded by VOAs or GenChem on a separate worksheet | | | |
| | Zn Aceta | - | - | | | | | | |
| | HCl | * | * | | | | | | |

Yes = All samples OK
 No = Samples were preserved at lab as listed
 PM OK to Adjust:

Bottle lot numbers: 070510-2AA
 Other Comments: _____

Secondary Review: MP 8/27/10

*significant air bubbles are greater than 5-6 mm

APPENDIX E

DATA VALIDATION

PROJECT NAME/NO. OB Grounds LTM Round 5
SDG: R1004141
FRACTION: metals (copper and lead)
LAB: CAS
MEDIA: Groundwater

| CRITERIA | Did Analyses Meet all criteria as specified in the SOPS? | If no, specify analysis IDs which do not meet criteria | Comments/Qualifying Actions | Qualifiers Added? |
|--|---|---|---|--------------------------|
| Data Completeness, Holding Times & Preservation | No | Temp > 4° C | The cooler temperature was 6° C upon receipt by the laboratory. All samples were received in good condition based on the laboratory login report. Sample pH was below 2. Holding time met criteria. No action was taken on elevated temperature since it was < 10° C. | No |
| Calibration | Yes | | Calibrations available, taken every ten samples, and within recovery limits (90-110%) for metals. Initial calibration R2 >0.99. | No |
| Blanks (method blank, prep blank) | No | Cu > MDL but < RL | ICB analyzed for Copper and Lead and detected Cu (5.014 ug/L) but < RL (20 ug/L). CCB analyzed for Cu and Pb every ten samples, all samples were less than the reporting limits (i.e., IDLs) for Lead. Copper was detected in all the CCBs ranging from 3.22 ug/L to 9.367 ug/L, but was < RL. Qualify all project sample Copper results as U and raise to the CRDL. Copper or lead was not detected in the preparation blank. No rinsate blank was collected for this SDG. | Yes |
| Interference Check Sample | Yes | | Met requirements (80-120%) for Copper and Lead. | No |
| CRQL Standard | Yes | | Initial and final CRQL Check Standards had recoveries within 70-130% for copper and lead. No action was taken. | No |
| Laboratory Control Sample | Yes | | LCS results within limits (i.e., 80-120%) for copper and lead, no action was taken. | No |
| Duplicates | YES | | Laboratory duplicate analysis was conducted for OBLM20033. Copper or lead was not detected either in the sample or the sample duplicate. A field duplicate pair (OBLM20033 and OBLM20034) was collected for this SDG. Copper and lead were detected in the duplicate sample but not the parent sample. No action was taken since the absolute difference between the results was < CRDL. | No |
| Spike Sample Analysis | YES | | Spike analysis was conducted for OBLM20033 and the spike results were within 75%-125% limits. Post digest spike results for OBLM20033 were also within the 75%-125% limits. | No |
| ICP Serial Dilution | YES | | ICP serial dilution was conducted for OBLM20033. As copper or lead was not detected in the original sample above the reporting limits, no action was taken. | No |
| Detection Limits | YES | | IDL's available used as reporting limits. IDLs of copper and lead are less than CRDLs. No action was taken. | No |
| ICP Linear Range | YES | | All results within the ICP linear range. | No |
