February 24, 1995

Dear Sirs and Madam:

Please find enclosed the final version of the Mid-Project Data Report. This document is submitted as part of the Ash Landfill Immediate Response Measure- Phase 2 project at the Seneca Army Depot Activity, Romulus, New York under Contract No. DACW45-94-D-0054, Delivery Order No. 01.

The Mid-Project Data Report presents the results of project sampling activities performed at the Ash Landfill site from the completion of the Prove-Out Event on November 8, 1994 to December 17, 1994, when the project was suspended for the holiday season. Sampling activities summarized in this report include verification and confirmatory soil material sampling, water discharge sampling, perimeter monitoring sampling, and on-site meteorological data collection. This report summarizes the analytical results and other measurements over the reporting period.

Questions concerning this document can be addressed to Mr. Peter Coutts or Mr. Jeffrey Korb of IT Corporation at (716) 271-6430.

Respectfully,

IT CORPORATION

1.0 Introduction

This Mid-Project Data Report summarizes the data collected to the mid-project point for the Ash Landfill remediation project. The report covers data generated from the end of the Prove-Out Event, November 8, 1994, through to December 18, 1994, when project activities were suspended for the holiday season. This Mid-Project Report has been submitted by IT Corporation (IT) in support of the Work Plan and Scope of Services for the Rapid Response Immediate Response Measure (IRM) at the Seneca Army Depot Activity in Romulus, New York. This Report has been prepared to provide a summary of the project data compiled by IT for the U.S. Army Corps of Engineers (USACE), Omaha District, so that it meets the requirements detailed in Delivery Order No. 01, under Rapid Response contract number DACW45-94-D-0054.

The Seneca Army Depot facility is located in Romulus, New York near the eastern shore of Seneca Lake, where it was constructed in 1941. The Ash Landfill site encompasses approximately 130 acres of the 10,587 acre Seneca Army Depot Activity (SEDA) facility, and is situated near the southwestern corner of the facility. The site consists of the abandoned landfill area, including the Ash Landfill and the Non-Combustible Landfill, a burned out incinerator building and stack, and a nearby cooling pond.

Section 2.0 of this Report provides a summary of project activities and details the types of data collected for the Mid-Project Report. The results of the various data collection activities are summarized and presented in Section 3.0. Section 4.0 describes the quality assurance/ quality control (QA/QC) performed for the project. In Section 5.0, general conclusions for the Mid-Project Report are discussed. Analytical data and other supporting documentation are included in this Report as Appendices. Appendix A contains soil data; Appendix B contains water analytical data; and Appendix C consists of air data and other documentation.

2.0 Project Activities Summary

Project activities are fully outlined in the Ash Landfill project Work Plan, written by IT and approved by the USACE in September, 1994. These activities include plant operations during LTTD remedial action, verification soil and water sampling, perimeter and work zone air monitoring, and on-site meteorological data collection. The Mid-Project Report documents project activities performed and completed from November 8, 1994 through December 18, 1994.

2.1 Project Objectives

The Ash Landfill Immediate Response Measure (IRM) project was originated to treat contaminated soils at the Ash Landfill project site to acceptable clean-up levels. Project activities to date have included the site preparation, baseline monitoring and soil boring tasks, start-up of the LTTD system, and verification of proper LTTD operation by testing of untreated and processed soils and air emissions. The original objectives of the Ash Landfill project includes:

- Confirm the extent of the known soil contamination areas in order to delineate with confidence the removal of all contaminated soils and debris for treatment;
- Treat contaminated soils by Low Temperature Thermal Desorption (LTTD) to remove halogenated volatile organic compounds (VOCs) to prescribed treatment levels and to reduce concentrations of polynucleated aromatic hydrocarbons (PAHs) present in the soils;
- Backfill the Ash Landfill with treated soil material; and,
- Measure and control dispersion of air pollution resulting from project activities.

The Ash Landfill IRM was designed to treat soil material in defined areas of the site to prescribed treatment clean-up levels. Once the LTTD system has effectively cleaned the soil material, as tested by the collection of confirmatory soil samples, the soils are returned to the excavation and backfilled to complete the remedial action. Water collected from the excavation area is treated prior to discharge by air stripping and particulate filtration. The water is then discharged, after confirmatory water sampling, to the surface. Air dispersion of VOCs, PAHs, and particulate matter from project activities are monitored by perimeter air monitoring stations and direct-read monitoring in the work zone. Meteorological conditions are recorded by an on-site meteorological station. Each of these activities is described below.

2.2 LTTD Operations

The LTTD system constructed for this project consists of a feeder/separator, a large, rotating dryer heated by propane gas, a conveyor belt system, and an off-gas emissions train that includes a baghouse and a thermal oxidizer as air pollution control equipment. The LTTD system is fed by a front-end loader at the feeder/separator unit, which handles the soil material and crushes it to the correct size for entry into the dryer. The material that enters is heated and then treated in the rotating dryer unit. The material passes out of the dryer on the conveyor system and is deposited in a pile in the clean soils area. Heated off-gas emissions from the soil treatment are captured and carried to the baghouse, which removes the particulate matter present in the air stream. After removal of the particulates, the air stream enters the thermal oxidizer unit and is heated to temperatures near 1400 °F to remove the volatile organic compounds.

The soil material excavated from the excavation areas is first processed through a debris screening unit to remove large-scale material. The screened material is added to the LTTD system and heated to approximately 800-900 °F while being fed through the rotary dryer. Soil material exiting the LTTD system is stored in 150 cubic yard piles prior to confirmation sampling and backfilling. The optimum processing rate is approximately 20 tons per hour.

In addition to the soil treatment operation, the LTTD system also captures the exhaust air stream from the rotating dryer. Particulate matter from the dryer exhaust is filtered through a baghouse filter collector with primary and secondary filter fabrics. Collected particulate fines are recycled back to the rotary dryer for retreatment. The particulate free off-gas is fed into the thermal oxidizer, where the volatilized contaminants are destroyed by applying heat necessary for oxidation. The air stream is then exhausted out of a 42-inch diameter, 56 foot tall stack.

2.3 Soil Sampling

The soil sampling activities performed following completion of the Prove-Out Event on November 8, 1994 included verification testing of soil material removed from all of Ash Landfill Excavation Area B and the eastern section of Excavation Area A. Post-treatment sampling of soil material from the LTTD system was conducted, with soil samples collected for every 150 tons of material processed through the treatment system. The soil samples collected from November 9 through December 19, 1994 represent a total of approximately 69 treated soil samples. The laboratory analytical results were evaluated versus the site-specific cleanup levels outlined in the project Work Plan and Scope of Services document.

In addition to the scheduled sampling described above, soil material was also collected as a confirmatory sample upon agreement between IT, the USACE, and NYSDEC. Soil material located at the northern boundary of Excavation Area B was sampled and analyzed. This unique sampling event utilized a different sampling technique than the verification sampling. Both methodologies are introduced in the paragraphs below.

2.3.1 Post-Treatment Soil Samples

Post-treatment soil material discharged from the LTTD system was collected from each of the 150 ton treated soil piles. Composite samples were collected for each 150 tons of post-processed soil consisting of 4 "grab/discrete" samples and analyzed for volatiles and semi-volatiles. In addition, one composite sample was collected, consisting of 4 "grab/discrete" samples, from each 150 ton soil pile treated within a 24 hour period and analyzed for TCLP metals. All "grab" samples were collected from four different locations around the perimeter of the soil pile, at a minimum of two feet below the soil pile surface using a long handled stainless steel trowel.

2.3.2 Confirmatory Soil Samples

One composite soil sample was collected from the side of the excavation wall and analyzed for volatiles and semivolatiles. This sample was taken due to the representative Phase I soil boring (SB129) containing volatile and semivolatile concentrations significantly exceeding site specific cleanup levels. As a result, Excavation Area B near the SB129 location was excavated an additional five feet vertical to the horizontal of the previously delineated excavation boundary. A composite soil sample was collected and sent for analysis in order to determine if the new excavation boundary is significant in order to meet project cleanup objectives.

2.4 Water Discharge Sampling

The water discharge samples collected as part of this project are representative of the wastewater generated during excavation activities at the project site, including: accumulated groundwater from the excavation, surficial runoff collected from the excavation areas, and/or decontamination water. All wastewater is collected and stored in 20,000 gallon tanks until treatment by an air stripping unit and particulate filtration can occur. The treated water is stored in 20,000 gallon tanks adjacent to the water treatment system pending analytical results from samples collected from the post-treatment tanks.

All water samples were collected by compositing water from two 20,000 gallon tanks with a

disposable bailer. Analytical results are evaluated against the site specific water discharge permit approved by the NYSDEC.

2.5 Perimeter Air Monitoring

Perimeter monitoring activities commenced in September, 1994, prior to the completion of the Prove-Out Event. Perimeter stations were located around the site based on data analyzed from the baseline monitoring program performed in early September, 1994. Each monitoring station housed the sampling equipment necessary to perform the sample collection protocol outlined in the Air Monitoring Plan (AMP), as follows:

- PM₁₀ high volume sampler
- Total Suspended Particulate (TSP) sampler
- Direct-read VOC monitor
- Direct-read particulate monitor

Monitoring equipment was placed on a scaffold and calibrated according to USEPA method requirements and/or manufacturer's instructions.

Sampling and analytical protocols for the ambient data collection followed appropriate USEPA reference methods. PM₁₀ samples and TSP samples were collected over 24 hour sampling periods. PM₁₀ filter samples were analyzed for particulate matter (particulate matter less than or equal to 10 microns in size). TSP filter samples were collected and analyzed for lead content only. Direct, real-time monitoring with a photoionization detector and dust monitor was also performed while ambient samples were collected. Direct-read VOC monitors collected samples frequently, but were typically recorded over two hour sampling periods for total VOC concentration. Particulate matter direct-read monitors collected data over two hour and 24 hour periods for total particulate matter.

2.6 On-Site Meteorological Station

The on-site meteorological (MET) station constructed for this project consists of a ten (10) meter retractable aluminum tower with specialized measurement sensors required by the AMP attached to the tower. These sensors include:

- wind direction vane
- wind speed sensor/anemometer
- temperature gauge

- relative humidity sensor
- barometric pressure gauge, and
- precipitation gauge

All sensors meet the required performance criteria outlined in the AMP. The MET station sensors are connected to a datalogging computer that records measurements every 5 minutes and averages these readings over a hourly period. Downloading of meteorological data is available on demand. Julian date and standard time (EST) are kept continuously by the datalog system. The MET station was located and sited according to USEPA siting criteria. The MET station is located away from obstructions that could influence wind measurements and is upwind from project work areas, as indicated from available prevalent wind direction data (see ES RI Report, October, 1993). Data collection commenced on August 28, 1994 and has been continuous throughout the project.

3.0 Mid-Project Data Results

A summary of the Mid-Project data results is presented below. LTTD system operating conditions were measured by recording processing and operating scenarios of the LTTD. The attainment of acceptable treatment criteria for the soil material by the LTTD system was also examined, utilizing soil sampling and analysis protocols. Air dispersion was monitored by testing at the site perimeter and in the work zone.

3.1 LTTD Operations Summary

The LTTD system was first fired on October 31, 1994 at approximately 1700 hours. After completion of the Prove-Out Event, records of the LTTD system operating conditions and processing information have been collected. Table 3-1 presents a summary of the LTTD processing record to date.

Treatment of the soil material continued after completion of the Prove-Out Event. The LTTD unit averaged just over 15 tons per hour processing rate during unit operation over the reporting period. Operating temperatures during this time period to process material ranged from 700-1015 °F, with an average of 896 °F.

During the project performance, the LTTD system experienced some operational difficulties and process downtime. These problems were varied, including: 1) obstruction of feed hopper, crusher, and conveyor mechanisms because of high moisture content of soil material; 2) system equipment failures requiring maintenance and repair time; and, 3) subcontractor labor restrictions caused by working in Level C conditions- adequate relief staff not available.

3.2 Soil Sampling Data Summary

The results from the laboratory analyses of post-treatment soil samples and the confirmatory soil sample are presented below. The laboratory analytical results were evaluated versus the site-specific cleanup levels. All soil samples were determined to contain volatile and/or semi-volatile constituents at concentrations below cleanup levels. Appendix A contains tabular summaries of the analytical results for the soil samples and copies of Certificates of Analysis.

3.2.1 Post-Treatment Soil Samples

The results from the laboratory analyses of treated soil samples are summarized below. The laboratory analytical results were evaluated versus the site-specific cleanup levels. In all treated soil samples, volatile constituents were successfully treated to below cleanup levels. Semivolatiles were proven to be significantly reduced in concentration. However, semivolatiles are still present in the treated soil samples with some of the semivolatile concentrations exceeding cleanup levels. The results are summarized in Table 1 of Appendix A.

All volatile constituents detected in the treated samples, with the exception of one sample (T-A1-9), were not detected in concentrations greater than the practical quantitation limits (PQLs). Four site specific volatile compounds (trichloroethene, 1,2-dichloroethene, toluene, and xylene) were detected at concentrations ranging from 0.1 (J) ppb to 12 ppb.

Semivolatiles were detected at varying concentrations in all treated samples. Out of the ten target semivolatile compounds, four semivolatile constituents were detected at concentrations greater than cleanup levels. The four semivolatile constituents (benzo(a)anthracene, benzo(a)pyrene, chrysene, and dibenzo(a,h)anthracene) ranged in concentrations from 15 ppb to 800 ppb and were detected in approximately half of the treated samples.

In addition, soil samples were collected from a composite of four grab samples from each 150 ton pile treated within a 24 hour period. These composite samples were submitted to the laboratory and analyzed for the eight toxicity characteristic metals. The results revealed that six of the eight metals analyzed for were detected (arsenic, barium, cadmium, lead, selenium, and silver) with none of the concentrations exceeding toxicity characteristic levels. Summary of the laboratory soil sample analytical results are presented in Table 2 of Appendix A.

3.2.2 Confirmatory Soil Sample

Analytical results of the confirmatory soil sample (identification number C-SB-129R) reveal two volatile compounds (trichloroethene and 1,2-dichloroethene). All but three of the semivolatiles (naphthalene, bis(2-ethylhexyl)phthalate, and indeno(1,2,3-cd)pyrene) were detected. None of these constituent concentrations exceed site specific cleanup levels. The volatile constituent concentrations are 15 (B) ppb to 47 ppb for trichloroethene and 1,2-dichloroethene, respectively. The sample results are summarized in Table 1 of Appendix A.

3.3 Water Discharge Data Summary

Two pretreated water samples were collected and analyzed for volatiles, semivolatiles, metals and various classical chemistry constituents. The analytical results reveal volatiles, metals and a range of classical chemistry constituents being detected in varying concentrations.

One treated water sample was collected and analyzed for volatiles, semivolatiles, metals, and total cyanide. The laboratory analytical results were evaluated versus the pending site-specific water discharge permit. Only metal constituents were detected with iron exceeding potential permit levels. The water was retreated and analyzed for iron only. Since the water discharge permit was incomplete at the time of receiving the two treated water analytical results, the water was containerized and shipped to the Seneca Army Depot POTW. A summary of the water discharge sample laboratory analytical results are presented in Appendix B.

3.4 Perimeter Air Monitoring Data Summary

Concentrations of VOCs and particulate matter were collected as part of the perimeter monitoring activities. Data are presented in Tables 1 through 4 in Appendix C. Data retrieval exceeded the program requirement of 90 percent. For reference, the Certificates of Analysis from the laboratory have also been included in Appendix C of this Report.

Concentrations of particulate matter collected via the PM₁₀ sampler ranged from 0.04 ug/m³ to 299.5 ug/m³ in the collected samples, with an average respirable dust concentration of 19.56 ug/m³. TSP samples, collected for lead analysis, reported lead concentrations ranging from 0.01 ug/m³ to 0.027 ug/m³, with an average lead concentration found in the air of 0.02 ug/m³.

Direct, real-time monitoring, for both particulate matter and VOCs, was performed on a periodic schedule while sampling was being conducted. Monitoring results for the particulate matter measurements are presented in Table 3 in Appendix C and results for the VOC concentrations are presented in Table 4 in Appendix C.

3.5 Meteorological Observation Summary

The on-site meteorological system collected localized measurements of wind speed, wind direction, relative humidity, barometric pressure, temperature, and precipitation levels. Meteorological parameter measurements collected prior to and during the air media sample collection showed no significant deviation from expected norms. The on-site MET station

performed well and achieved project quality objectives stated in the AMP with greater than 90% retrieval. Raw meteorological data and a descriptive windrose are included in Appendix C for reference.

Meteorological measurements include temperature readings ranging from a high of 84.8° F at 1300 hours on September 16, 1994 to a low of 12.19° F at 0800 hours on December 12th. Average temperature during the report monitoring period was 49.96° F. Total precipitation recorded for the period was as expected. From the hourly wind direction and wind speed data, a composite windrose for the on-site MET station is presented in Appendix C. The windrose provides a representation of the local wind conditions for the reporting period.

4.0 Quality Assurance/Quality Control (QA/QC)

All project activities, implemented under the Work Plan for the Seneca Army Depot Ash Landfill IRM, is subject to the quality assurance and quality control guidelines presented in the SPP, CSAP, and AMP. Specific requirements are also listed in the particular sampling and analytical reference methods utilized for this portion of the project. The QA/QC program implemented for this task includes:

- Detailed sample collection and handling protocols
- Calibration of instrumentation and apparatus
- Sample analysis in association with specific QC activities, such as blank and duplicate analyses
- Data reduction, validation, and reporting
- Documentation of the sampling and analytical program, and
- Internal quality control.

Specific steps for this task were undertaken at the analytical laboratory, as method and instrument blanks, calibration checks, and duplicate sample analyses were completed for the sample sets. Raw data and the associated QA/QC results for the soil sampling and water discharge testing can be found in Appendices A and B, respectively.

5.0 Conclusions

Conclusions at the mid-point of the Ash Landfill project include:

- The LTTD system is able to meet the necessary processing performance requirements for the project;
- Performance of the LTTD unit continues to demonstrate successful reduction/elimination of volatile constituents detected in the soil samples to at or below constituent PQLs. The LTTD unit is able to treat soils to achieve VOC clean-up criteria stipulated in the Work Plan;
- Performance of the LTTD unit also indicates reduction in concentrations of semi-volatile constituents detected in pretreatment soil samples. Most of the semi-volatile constituents detected above cleanup levels in the pretreatment soil samples are successfully reduced to concentrations below cleanup levels;
- Air contaminant dispersion generated by the LTTD system or other project activities has been appropriately measured and controlled; the perimeter monitoring activities have successfully monitored air dispersion from the project site; and,
- The on-site meteorological station continues to collect quality data of localized weather conditions.

Notes:

B -

J -

*(BOLD) -

** -

Indicates constituent also detected in the associated method blank.

Indicates an estimated value. Concentration above the instrument detection limit (IDL) but below the practical quantitation limit (PQL).

Indicates constituent concentration detected above site specific cleanup levels.

Dibenzo(a,h)anthracene has a PQL of 18 ppb and a method detection limit of 4.5 ppb. Any sample resulting in Dibenzo(a,h)anthracene not detected at the PQL is not considered detected above the site specific cleanup level (14 ppb) at a 95 % confidence level and therefore has not been indicated as such.

Seneca Army Depot
Ash landfill, Phase II

Treated Wastewater Analytical Results

The following analytical data represents one treated water sample taken on 12-06-94 and analyzed for Iron only. The sample is representative of 40,000 gallons of treated water to be discharged.

Sample ID	Analytical Constituents	Constituent Concentration (ppm)	Permit level (ppm)	Above Permit Level?
C-12-2	Iron	0.80	0.80	no

Notes:
ppm - Parts per million

Metals Work Center
Report

Title: Determination of Fe in SEDA Ash landfill

Customer: Seneca Army Depot Job F: 01568

Date received: 12/06/94 Analyte(s): Fe

Sample ID: 0193362 Method Used: EPA 3010

Technique: Inductively Coupled Plasma-Atomic Emission Spectroscopy.

Results: The results are expressed in mg/L. The detection limit for Fe is 0.005. "<" indicates less than detection limit.

Element-	Concentration (mg/L)-
Fe	0.8

This report will be kept on file in the MWC, B-34 for two years.

This is the Certificate of Analysis for the following samples:

Client Project ID:	SEDA-519200
Date Received by Lab:	November 14, 1994
Number of Samples:	Ten (10)
Sample Type:	Air

I. Introduction

On November 14, 1994, ten (10) air samples arrived at Quanterra Environmental Services, Knoxville, Tennessee, from IT Engineering Services, Rochester, New York. The list of analytical tests performed, as well as date of receipt and analysis, can be found in the attached report.

II. Analytical Results/Methodology

The analytical results for this report are presented by analytical test. Each set of data will include sample identification information and the analytical results.

The samples were analyzed for lead based on method CFR43-46258/61A.

Reviewed and Approved:

Kenneth Mueller
Project Manager

IT Engineering Services
November 30, 1994

Client Project ID: SEDA-519200

Job Number: 2000

III. Quality Control

Routine laboratory level I QC was followed.

IV. Comments

The filters used for the gravimetric analysis were intended for lead sampling and were not weighed prior to shipment, therefore, the total suspended particulate (TSP) analysis could not be performed.

Client Project ID: SEDA-519200

Job Number: 2000

This is the Certificate of Analysis for the following samples:

Client Project ID:	SEDA-519200
Date Received by Lab:	November 23, 1994
Number of Samples:	Nineteen (19)
Sample Type:	Air

I. Introduction

On November 23, 1994, nineteen (19) air samples arrived at Quanterra Environmental Services, Knoxville, Tennessee, from IT Engineering Services, Rochester, New York. The list of analytical tests performed, as well as date of receipt and analysis, can be found in the attached report.

II. Analytical Results/Methodology

The analytical results for this report are presented by analytical test. Each set of data will include sample identification information and the analytical results.

The samples were analyzed for lead based on method CFR43-46258/61A.

The samples were analyzed for total suspended particulate based on method PM-10

Reviewed and Approved:

Kenneth Mueller

This is the Certificate of Analysis for the following samples:

Client Project ID:	SEDA-519200
Date Received by Lab:	November 28, 1994
Number of Samples:	Twenty-six (26)
Sample Type:	Air

I. Introduction

On November 28, 1994, twenty-six (26) air samples arrived at Quanterra Environmental Services, Knoxville, Tennessee, from IT Engineering Services, Rochester, New York. The list of analytical tests performed, as well as date of receipt and analysis, can be found in the attached report.

II. Analytical Results/Methodology

The analytical results for this report are presented by analytical test. Each set of data will include sample identification information and the analytical results.

The samples were analyzed for lead based on method CFR43-46258/61A.

The samples were analyzed for total suspended particulate based on method PM-10

JAN 26 1995

ROCHESTER
EES

IT Engineering Services
140 Allens Creek Road
Suite 150
Rochester, NY 14618
Attn: Jeff Korb

January 25, 1995

Job Number: 2311 (Amended Certificate)

P.O. Number: 162800

This is the Certificate of Analysis for the following samples:

Client Project ID:	SEDA-519200
Date Received by Lab:	December 14, 1994
Number of Samples:	Ten (10)
Sample Type:	Air

I. Introduction

On December 14, 1994, ten (10) air samples arrived at Quanterra Environmental Services, Knoxville, Tennessee, from IT Engineering Services, Rochester, New York. The list of analytical tests performed, as well as date of receipt and analysis, can be found in the attached report.

Sample 112594-2PM10B-A287048 was to be analyzed for total suspended particulate. However, the sample was analyzed for lead. This report includes the results.

II. Analytical Results/Methodology

The analytical results for this report are presented by analytical test. Each set of data will include sample identification information and the analytical results.

Reviewed and Approved:

A handwritten signature in cursive script, appearing to read "Kenneth Mueller", written over a horizontal line.

Kenneth Mueller
Project Manager

IT Engineering Services
January 25, 1995

Client Project ID: SEDA-519200

Job Number: 2527

II. Analytical Results/Methodology (Continued)

The samples were analyzed for lead based on method CFR43-46258/61A.

The samples were analyzed for total suspended particulate based on method PM-10.

III. Quality Control

Routine laboratory level I QC was followed.

Client Project ID: SEDA-519200

Job Number: 2311 (Amended Certificate)

Job Number: 2477

P.O. Number: 162800

This is the Certificate of Analysis for the following samples:

Client Project ID:	SEDA-519200
Date Received by Lab:	January 5, 1995
Number of Samples:	Sixty-five (65)
Sample Type:	Air

I. Introduction

On January 5, 1995, sixty-five (65) air samples arrived at Quanterra Environmental Services, Knoxville, Tennessee, from IT Engineering Services, Rochester, New York. The list of analytical tests performed, as well as date of receipt and analysis, can be found in the attached report.

II. Analytical Results/Methodology

The analytical results for this report are presented by analytical test. Each set of data will include sample identification information and the analytical results.

The samples were analyzed for lead based on method CFR43-46258/61A.

The samples were analyzed for total suspended particulate based on method PM-10.

Reviewed and Approved:

Kenneth Mueller
Project Manager

IT Engineering Services
January 23, 1995

Client Project ID: SEDA-519200

Job Number: 2477

III. Quality Control

Routine laboratory level I QC was followed.

Client Project ID: SEDA-519200

Job Number: 2477

This is the Certificate of Analysis for the following samples:

Client Project ID:	SEDA-519200
Date Received by Lab:	January 12, 1995
Number of Samples:	Thirty-nine (39)
Sample Type:	Air

I. Introduction

On January 12, 1995, thirty-nine (39) air samples arrived at Quanterra Environmental Services, Knoxville, Tennessee, from IT Engineering Services, Rochester, New York. The list of analytical tests performed, as well as date of receipt and analysis, can be found in the attached report.

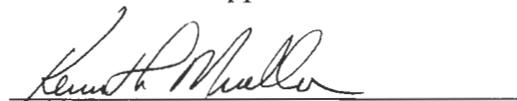

II. Analytical Results/Methodology

The analytical results for this report are presented by analytical test. Each set of data will include sample identification information and the analytical results.

The samples were analyzed for lead based on method CFR43-46258/61A.

The samples were analyzed for total suspended particulate based on method PM-10.

Reviewed and Approved:

Kenneth Mueller
Project Manager

IT Engineering Services
January 25, 1995

Client Project ID: SEDA-519200

Job Number: 2527

III. Quality Control

Routine laboratory level I QC was followed.

Client Project ID: SEDA-519200

Job Number: 2527

Notes:

- A- Exceeds AMP criteria parameter for maximum wind speed (> 25 m/s); results are considered valid.
- B- Precipitation gauge is suspected of malfunction; results are considered invalid.
- 1- Exceeds AMP criteria: does not vary > 0.1 m/s for three (3) consecutive hours; results are considered valid.
- 2- Exceeds AMP criteria: does not vary > 1 degree for three (3) consecutive hours; results are considered valid.
- 3- Wind direction vane not functioning; results are considered invalid.
- 4- Exceeds AMP criteria: greater than 5 degree F change from previous hour; results are considered valid.
