FINAL

REMEDIAL INVESTIGATION REPORT
AT THE FIRE TRAINING AND DEMONSTRATION PAD (SEAD-25)
AND THE FIRE TRAINING PIT AND AREA (SEAD-26)
APPENDICES

MAY 1998/MAR 1999

SEAD-25

LOG OF BORING NO. SB25-1

PROJECT: **SEAD-25 & SEAD-26 RI/FS**
PROJECT LOCATION: **Seneca Army Depot Activity, Romulus, NY 14541**
ASSOCIATED UNIT/AREA: **SEAD-25**
PROJECT NO: **728059**
DATE STARTED: **12/03/93**
DATE COMPLETED: **12/03/93**
DRILLING CONTRACTOR: **Empire Soils Investigation, Inc.**
DRILLING METHOD: **Hollow Stem Auger**
SAMPLING METHOD: **3 inch Split Spoons**

DEPTH TO WATER (ft): **NA**
BORING LOCATION (N/E): **998092.6 751014.3**
REFERENCE COORDINATE SYSTEM: **NY STATE PLANAR**
GROUND SURFACE ELEVATION (ft): **743.5**
DATUM: **NGVD 83**
INSPECTOR: **B.Harvey, M.Burns**
CHECKED BY: **P.Feschbach-Meriney**

Sample Number	Blow Counts (# Blows per 6")	Sample Advance	Sample Recovery	VOC Screen-PID (ppm)	Rad Screen (cps)	Depth (ft.)	USCS CLASS	DESCRIPTION	Depth	Macro	Macro Lithology
								This log is part of a report prepared by Parsons Engineering-Science, Inc. for the named project and should be read together with the report for complete interpretation. This summary applies only at the location of this boring and at the time of drilling. Subsurface conditions may differ at other locations.			
SB25 -1.1	8 10 10 16	2.00	1.0	0	NA	1	GM	Dark brown to black fine gravel-sized SHALE fragments, little fine Sand, wet, petroleum odor.	0.00	FL	
						1.0			1.00		
							ML	Grayish brown SILT and CLAY, little fine to medium gravel-sized Shale, trace very fine Sand, moist, no odor.		TL	
SB25 -1.2	6 12 14 20	2.00	1.2	0	NA	2					
						3					
SB25 -1.3	27 45 60 60	2.00	1.9	0	NA	4					
						5					
SB25 -1.4	45 95 100/.1	1.10	1.1	0	NA	6					
						6.5			6.50		
						7		Dark gray highly fissile SHALE, some interstitial brown Silt, Clay, and very fine Sand, dry, no odor.		WS	
									7.10		
								SPLIT SPOON REFUSAL AT 7.1 FEET.		CS	
								Dark gray to black SHALE, dry, no odor.

SOIL GAS CALIBRATION DATA FOR MIXED BTEX STANDARDS

ENGINEERING–SCIENCE | CLIENT: ACOE | DATE: 9/20/95

PROJECT: RI SEAD-25

LOCATION: SEAD-25

Operator: Kerry Smith, Paul Fechbach-Moray

Instrument Specs:

Type of GC: PhotoVac
Column Type: CPSil-5
Chart Speed: 1 cm/min
Gain: 10
Sensitivity: 5/10
Gas Flow Rate: 10 ml/min
Tank Pressure: 1850 psi

Standard: BTEX
Concentration: 20 PPM
Inj. volume: 0.5 ml
Analysis #: TNL 16
Time: 1111
Tedlar or (Glass Bulb)

Comments: .5 ml Injection - multiplied Area/ppm by 2

20 ppm

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	20.6		0.5 ml		10.3	~~+71~~ 58.8	56.2	~~36.34~~	
Toluene	20.0				10.0	~~232~~ 65.8	123.5	0.30	
Ethylbenzene	20.16				10.8	~~154~~ 27.2	260.6	0.74	
O–Xylenes	20.12				10.6	~~350~~ 83	276.2	0.24	
M–Xylenes	20.2				10.6	~~370~~ 83	278.2	0.24	
P–Xylenes	20.04				10.02	~~258~~ 58.8	331.7	0.34	

Notes: RF = Conc. ÷ Area (vs) ; Actual Std. Conc. is to be obtained from analysis of gas standard ; Conc. normalized to 1 ml injection.

Standard: BTEX
Concentration: 10 PPM
Inj. volume: 0.5 ml
Analysis #: 14
Time: 10:42
Tedlar or (Glass Bulb)

Comments: but multiplied the Area/ppm by 2 x2

10 ppm

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (x 2) (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	10.3		0.5 ml		5.15	37.4	54.1	0.27	
Toluene	10.00				5.00	39.8	121.7	0.25	
Ethylbenzene	10.08				5.04	22.0	258.8	0.46	
O–Xylenes	10.06				5.03	89.6	277.1	0.11	
M–Xylenes	10.06				5.03	89.6	277.1	0.11	
P–Xylenes	10.02				5.01	40.6	331.1	0.24	

Notes: RF = Conc. ÷ Area (vs) ; Actual Std. Conc. is to be obtained from analysis of gas standard ; Conc. normalized to 1 ml injection.

Standard: BTEX
Concentration: 5 PPM
Inj. volume: 1 ml
Analysis #: 12
Time: 10:30
Tedlar or (Glass Bulb)

Comments:

5ppm

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	5.15		1 ml		5.15	23.3	54.0	0.22

SOIL GAS CALIBRATION DATA FOR MIXED BTEX STANDARDS

ENGINEERING–SCIENCE	CLIENT: ACOE	DATE: 9/21/95
PROJECT: Remedial Investigation LOCATION: SEAD - 25		Operator: KS / PFM

Instrument Specs:

Type of GC: Photovac
Column Type: CPSil - 5
Chart Speed: 1cm/min
Gain: 10
Sensitivity: 5/10
Gas Flow Rate: 10 ml/min
Tank Pressure: 1200 psi

Standard: 2 PPM
Concentration: 20 PPM Tedlar or (Glass Bulb)
Inj. volume: 0.1 ml Gain - 5
Analysis #: 3
Time: 19:25

Comments: 50ppm x .4 = 20 ppm (start with 20 ppm bulb)

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	20.6		0.1		2.06	3.1	515.3	0.66	
Toluene	20.00		0.1		2.00	3.5	127.4	0.57	
Ethylbenzene	20.16		0.1		2.16	3.5	282.8	0.62	
O–Xylenes	20.12		0.1		2.01	8.1	307.1	0.25	
M–Xylenes	20.12		0.1		2.01	8.1	307.1	0.25	
P–Xylenes	20.04		0.1		2.00	4.5	367.0	0.44	

Notes: RF = Conc. ÷ Area (vs) ; Actual Std. Conc. is to be obtained from analysis of gas standard ; Conc. normalized to 1 ml injection.

Standard: 5 ppm
Concentration: 20 ppm Tedlar or (Glass Bulb)
Inj. volume: 0.25 Gain - 5
Analysis #: 10
Time: 19:34

Comments: (start with 20 ppm bulb)

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	20.6		0.25		5.15	6.4	55.7	0.81	
Toluene	20.00		0.25		5.00	6.6	128.4	0.75	
Ethylbenzene	20.16		0.25		5.04	6.3	285.8	0.80	
O–Xylenes	20.12		0.25		5.03	15.3	310.7	0.33	
M–Xylenes	20.12		0.25		5.03	15.3	310.7	0.33	
P–Xylenes	20.04		0.25		5.01	9.4	371.2	0.53	

Notes: RF = Conc. ÷ Area (vs) ; Actual Std. Conc. is to be obtained from analysis of gas standard ; Conc. normalized to 1 ml injection.

Standard: 10 ppm
Concentration: 20 ppm Tedlar or (Glass Bulb)
Inj. volume: 0.5 ml Gain - 5
Analysis #: 12
Time: 20:00

Comments:

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	20.6		0.5		10.3	~~57.7~~ 12.7	~~12.7~~ 57.7	0.81	
Toluene	20.00		↓		10.00	~~131.6~~ 11.0	~~11.0~~ 131.6	0.91	
Ethylbenzene	20.16				10.08	~~240.8~~ 8.5	~~8.5~~ 240.8	1.18

SOIL GAS CALIBRATION DATA FOR MIXED BTEX STANDARDS

ENGINEERING–SCIENCE | CLIENT: ACOE | DATE: 9/22/95 (A)

PROJECT: Remedial Investigation

LOCATION: SEAD-25

Operator: KS/PFM

Instrument Specs:

Type of GC: Photovac
Column Type: CPSil-5
Chart Speed: 1 cm/min
Gain: 5
Sensitivity: 5/10
Gas Flow Rate: 10
Tank Pressure: 1600 PSI

Standard: 20 PPM
Concentration: 20 PPM — Tedlar or (Glass Bulb)
Inj. volume: 10 ml
Analysis #: 9
Time: 9:04

Comments: two separation on ethylbenzene

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	20.6		1 ml		20.6	27.1	56.6	0.76	
Toluene	20.00		1 ml		20.00	21.7	126.2	0.92	
Ethylbenzene	20.16		1 ml		20.16	–	–	–	–
O–Xylenes	20.12		1 ml		20.12	65.8	299.0	0.31	
M–Xylenes	20.12		1 ml		20.12	65.8	299.0	0.31	
P–Xylenes	20.04		1 ml		20.04	29.6	352.7	0.68	

Notes: RF = Conc. ÷ Area (vs) ; Actual Std. Conc. is to be obtained from analysis of gas standard ; Conc. normalized to 1 ml injection.

Standard: 20 ppm
Concentration: 20 PPM — Tedlar or (Glass Bulb)
Inj. volume: 0.5 ml
Analysis #: 11
Time: 0922

Comments: – two separation on Ethylbenzene

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	20.6		0.5 ml		10.3	~~27.1~~ 12.9	54.7	0.80

SOIL GAS CALIBRATION DATA FOR MIXED BTEX STANDARDS

ENGINEERING–SCIENCE	CLIENT: ACOE	DATE: 9/23/95
PROJECT: Remedial Investigation LOCATION: SEAD-25		Operator: KS/PFM

Standard: 500 ppm BTEX Std.
Concentration: 20 ppm Dilution Tedlar or (Glass Bulb)
Inj. volume: 0.5 ml
Analysis #: 4
Time: 0907

Comments:

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	20.6		0.5 ml		10.3	11.1	69.6	~~0.93~~	
Toluene	20.0		0.5 ml		10	10.1	171.8	~~0.99~~	
Ethylbenzene	20.16		0.5 ml		10.08	8.9	413.2	1.13	
O–Xylenes	20.12		0.5 ml		10.06	23.4	452.4	0.43	
M–Xylenes	20.12		0.5 ml		10.06	23.4	452.4	0.43	
P–Xylenes	20.04		0.5 ml		10.02	13.2	546.1	0.76	

Notes: RF = Conc. ÷ Area (vs) ; Actual Std. Conc. is to be obtained from analysis of gas standard ; Conc. normalized to 1 ml injection.

Standard:
Concentration: Tedlar or Glass Bulb
Inj. volume:

SOIL GAS CALIBRATION DATA FOR MIXED BTEX STANDARDS

ENGINEERING–SCIENCE	CLIENT: ACOE	DATE: 9/25/95
PROJECT: Remedial Investigation LOCATION: SEAD-25		Operator: KS/PFM/ES

Instrument Specs:

Type of GC: Photovac 10S50
Column Type: CPSil-5
Chart Speed: 1 cm/min
Gain: 20
Sensitivity: 5/10
Gas Flow Rate: 9 ml/min
Tank Pressure: 40 psi

Standard: 50 ppm BTEX Std.
Concentration: 1.0 ppm Dilution Tedlar or (Glass Bulb)
Inj. volume: 1 ml
Analysis #: 7
Time: 0921

Comments:

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	1.03		1.0		1.03	9.1	69	0.11	
Toluene	1.00		↓		1.00	9.6	167.3	0.10	
Ethylbenzene	1.01				1.01	8.9	391.5	0.11	
O–Xylenes	1.01				1.01	22.3	426.8	0.11	
M–Xylenes	1.01				1.01	22.3	426.8	0.11	
P–Xylenes	1.00				1.00	10.7	513.9	0.09	

Notes: RF = Conc. ÷ Area (vs) ; Actual Std. Conc. is to be obtained from analysis of gas standard ; Conc. normalized to 1 ml injection.

Standard: 50 ppm BTEX Std.
Concentration: 1.0 ppm Dilution Tedlar or (Glass Bulb)
Inj. volume: 0.5 ml
Analysis #: 12
Time: 0955

Comments:

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF
Benzene	1.03		0.5		0.52	4.6	67.3	0.11	
Toluene	1.00		↓		0.50	5.1	161.0	0.10	
Ethylbenzene	1.01				0.50	4.9	375.4	0.10

CLIENT USACOE JOB NO. _____ SHEET 1 OF 1

SUBJECT Seneca Army Depot - SEAD 25 BY KICS DATE 9-27-95

BTEX Liquid Standard Dilutions CKD. _____ REVISION _____

Manufacturer : Chem Service
Standard : BTEX Mixture (200ug/ml in Methanol)
Lot # : 136-144A

Benzene
Toluene
Ethylbenzene
o-xylene
m-xylene
p-Xylene

200 ug/ml (+/- 5%)

Note : 200 ug/ml = 200 ppm

Dilution Procedure

100 ul of 200 ppm Standard added to 100 ml flask (Distilled Water) = 200 ppb Std

50 ul of 200ppm Standard added to 100 ml flask (") = 100 ppb Std.

10 ml of 100 ppb Std added to 10 ml distilled water = 20 ml - 50 ppb Std.

10 ml of 100ppb Std added to 100 ml flask (Distilled water) = 10 ppb Std.

SOIL GAS CALIBRATION DATA FOR MIXED BTEX STANDARDS

ENGINEERING–SCIENCE	CLIENT: USACOE	DATE: 9-27-95
PROJECT: Seneca Army Depot RI/FS LOCATION: SEAD - 25		Operator: KKS

Instrument Specs:

Type of GC: Photovac 10S50
Column Type:
Chart Speed:
Gain: 5
Sensitivity:
Gas Flow Rate: 12 ml/min
Tank Pressure: 40

Standard: BTEX
Concentration: 200 PPB Tedlar or Glass Bulb
Inj. volume: 1 ml
Analysis #: 14
Time: 1103

Comments: Water headspace

Analyte:	Actual Std. Conc.(ppmV)	x	Injection Vol.(ml)	=	Normalized Conc.(ppmV)	Area (vs)	Retention Time (sec.)	Response Factor	Delta RF

==

TEST DESCRIPTION

Data set........... mw251.dat
Data set title..... Rising Head Slug Test for MW25-1

Knowns and Constants:
- No. of data points.................. 26
- Radius of well casing............... 0.086
- Radius of well...................... 0.33
- Aquifer saturated thickness......... 2.24
- Well screen length.................. 1.34
- Static height of water in well...... 2.24
- Log(Re/Rw).......................... 1.312
- A, B, C............................. 0.000, 0.000, 0.763

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	6.7687E-003	+/-	3.6255E-004
y0 =	1.0965E+000	+/-	5.3364E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 26
- Number of estimated parameters.... 2
- Degrees of freedom................ 24
- Residual mean..................... 0.01648
- Residual standard deviation....... 0.04311
- Residual variance................. 0.001859

Model Residuals:

A Q T E S O L V

A Program for

Automatic Estimation of Aquifer Coefficients

From Aquifer Test Data

By:

Glenn M. Duffield
and
James O. Rumbaugh, III

Geraghty & Miller Modeling Group
1895 Preston White Drive, Suite 301
Reston, VA 22091

(703) 476 - 0335

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- o confined aquifers, unconfined aquifers, and leaky aquifers
- o pumping tests, injection tests, recovery tests, and slug tests

Features:

- o Interactive, menu-driven program design
- o Nonlinear least-squares estimation of aquifer coefficients
- o Statistical analysis of results
- o Complete graphical display of results

<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<>>.

A Q T E S O L V   R E S U L T S
Version 1.10

02/07/96 19:10:52

TEST DESCRIPTION

Data set........... mw253.dat
Data set title..... Rising Head Slug Test for MW25-3

Knowns and Constants:
- No. of data points.................. 278
- Radius of well casing.............. 0.086
- Radius of well..................... 0.33
- Aquifer saturated thickness......... 5.96
- Well screen length................. 2
- Static height of water in well...... 5.96
- Log(Re/Rw)......................... 1.841
- A, B, C............................ 0.000, 0.000, 0.988

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	1.1148E-004	+/-	1.4500E-006
y0 =	2.5772E+000	+/-	7.3150E-003

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals.............. 273
- Number of estimated parameters.... 2
- Degrees of freedom............... 271
- Residual mean.................... 0.01519
- Residual standard deviation....... 0.08973
- Residual variance................ 0.008051

del Residuals:

A Q T E S O L V

A Program for

Automatic Estimation of Aquifer Coefficients

From Aquifer Test Data

By:

Glenn M. Duffield
and
James O. Rumbaugh, III

Geraghty & Miller Modeling Group
1895 Preston White Drive, Suite 301
Reston, VA 22091

(703) 476 - 0335

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- confined aquifers, unconfined aquifers, and leaky aquifers
- pumping tests, injection tests, recovery tests, and slug tests

Features:

- Interactive, menu-driven program design
- Nonlinear least-squares estimation of aquifer coefficients
- Statistical analysis of results
- Complete graphical display of results

TEST DESCRIPTION

Data set........... mw254.dat
Data set title..... Rising Head Slug Test for MW25-4D

Knowns and Constants:
- No. of data points.................. 209
- Radius of well casing............... 0.086
- Radius of well...................... 0.16
- Aquifer saturated thickness......... 419.5
- Well screen length.................. 9
- Static height of water in well...... 21.31
- Log(Re/Rw).......................... 2.953
- A, B, C............................. 3.265, 0.523, 0.000

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	6.6151E-004	+/-	1.1511E-005
y0 =	2.1799E+000	+/-	8.8105E-003

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 204
- Number of estimated parameters.... 2
- Degrees of freedom................ 202
- Residual mean..................... 0.02089
- Residual standard deviation....... 0.06549
- Residual variance................. 0.004289

A Q T E S O L V   R E S U L T S

Version 1.10

02/07/96 19:25:36

TEST DESCRIPTION

Data set........... mw256.dat
Data set title..... Rising Head Slug Test for MW25-6

Knowns and Constants:
- No. of data points................. 246
- Radius of well casing.............. 0.086
- Radius of well..................... 0.33
- Aquifer saturated thickness......... 10.29
- Well screen length................. 7
- Static height of water in well...... 10.29
- Log(Re/Rw)......................... 2.501
- A, B, C............................. 0.000, 0.000, 1.698

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

RESULTS FROM STATISTICAL CURVE MATCHING

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals.............. 240
- Number of estimated parameters.... 2
- Degrees of freedom............... 238
- Residual mean.................... 0.01963
- Residual standard deviation....... 0.05912
- Residual variance................ 0.003495

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- o confined aquifers, unconfined aquifers, and leaky aquifers

TEST DESCRIPTION

Data set........... mw257.dat
Data set title..... Rising Head Slug Test for MW25-7D

Knowns and Constants:
- No. of data points.................. 310
- Radius of well casing............... 0.086
- Radius of well...................... 0.16
- Aquifer saturated thickness......... 420.7
- Well screen length.................. 9
- Static height of water in well...... 28.93
- Log(Re/Rw).......................... 3.073
- A, B, C............................. 3.265, 0.523, 0.000

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	2.9288E-005	+/-	3.8864E-007
y0 =	4.0834E+000	+/-	1.2973E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 309
- Number of estimated parameters.... 2
- Degrees of freedom................ 307
- Residual mean..................... 0.03497
- Residual standard deviation....... 0.1662
- Residual variance................. 0.02763

del Residuals:

TEST DESCRIPTION

Data set........... mw258.dat
Data set title..... Rising Head Slug Test for MW25-8

Knowns and Constants:
- No. of data points.................. 69
- Radius of well casing............... 0.086
- Radius of well...................... 0.33
- Aquifer saturated thickness......... 3.57
- Well screen length.................. 0.8
- Static height of water in well...... 3.57
- Log(Re/Rw).......................... 1.398
- A, B, C............................. 0.000, 0.000, 0.615

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

A Q T E S O L V

A Program for

Automatic Estimation of Aquifer Coefficients

From Aquifer Test Data

By:

Glenn M. Duffield
and
James O. Rumbaugh, III

Geraghty & Miller Modeling Group
1895 Preston White Drive, Suite 301
Reston, VA 22091

(703) 476 - 0335

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- o confined aquifers, unconfined aquifers, and leaky aquifers
- o pumping tests, injection tests, recovery tests, and slug tests

Features:

- o Interactive, menu-driven program design
- o Nonlinear least-squares estimation of aquifer coefficients
- o Statistical analysis of results
- o Complete graphical display of results

```

TEST DESCRIPTION

Data set........... mw2512.dat
Data set title..... Rising Head Slug Test for MW25-12D

Knowns and Constants:
- No. of data points.................. 211
- Radius of well casing............... 0.086
- Radius of well...................... 0.16
- Aquifer saturated thickness......... 420.7
- Well screen length.................. 9.5
- Static height of water in well...... 22.85
- Log(Re/Rw).......................... 3.008
- A, B, C............................. 3.359, 0.537, 0.000

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	1.4101E-003	+/-	3.1138E-005
y0 =	3.3484E+000	+/-	2.4218E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 211
- Number of estimated parameters.... 2
- Degrees of freedom................ 209
- Residual mean..................... 0.06321
- Residual standard deviation....... 0.1456
- Residual variance................. 0.02121

Model Residuals:

TEST DESCRIPTION

Data set........... mw2513.dat
Data set title..... Rising Head Slug Test for MW25-13

Knowns and Constants:
- No. of data points.................. 93
- Radius of well casing.............. 0.086
- Radius of well..................... 0.33
- Aquifer saturated thickness......... 2.62
- Well screen length................. 0.8
- Static height of water in well...... 2.62
- Log(Re/Rw)......................... 1.275
- A, B, C............................ 0.000, 0.000, 0.615

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	1.6191E-003	+/-	2.7586E-005
y0 =	1.6367E+000	+/-	1.6254E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 93
- Number of estimated parameters.... 2
- Degrees of freedom................ 91
- Residual mean..................... 0.007114
- Residual standard deviation....... 0.04748
- Residual variance................. 0.002254

TEST DESCRIPTION

Data set........... mw2514.dat
Data set title..... Rising Head Slug Test for MW25-14D

Knowns and Constants:

```
   No. of data points.................. 198
   Radius of well casing............... 0.086
   Radius of well...................... 0.16
   Aquifer saturated thickness......... 421.3
   Well screen length.................. 9
   Static height of water in well...... 22.53
   Log(Re/Rw).......................... 2.975
   A, B, C.............................  3.265,  0.523,  0.000
```

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	8.5451E-004	+/-	1.4422E-005
y0 =	3.5602E+000	+/-	1.5168E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:

```
   Number of residuals............... 196
   Number of estimated parameters.... 2
   Degrees of freedom................ 194
   Residual mean..................... 0.03867
   Residual standard deviation....... 0.1059
   Residual variance................. 0.01122
```

TEST DESCRIPTION

Data set........... mw2515.dat
Data set title..... Rising Head Slug Test for MW25-15

Knowns and Constants:
- No. of data points.................. 293
- Radius of well casing............... 0.086
- Radius of well...................... 0.33
- Aquifer saturated thickness......... 4.64
- Well screen length.................. 1.5
- Static height of water in well...... 4.64
- Log(Re/Rw).......................... 1.676
- A, B, C............................. 0.000, 0.000, 0.821

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	5.2336E-005	+/-	4.8857E-007
y0 =	1.6337E+000	+/-	3.6225E-003

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 290
- Number of estimated parameters.... 2
- Degrees of freedom................ 288
- Residual mean..................... 0.001117
- Residual standard deviation....... 0.04775
- Residual variance................. 0.00228

Model Residuals:

A Q T E S O L V

A Program for

Automatic Estimation of Aquifer Coefficients

From Aquifer Test Data

By:

Glenn M. Duffield
and
James O. Rumbaugh, III

Geraghty & Miller Modeling Group
1895 Preston White Drive, Suite 301
Reston, VA 22091

(703) 476 - 0335

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- o confined aquifers, unconfined aquifers, and leaky aquifers
- o pumping tests, injection tests, recovery tests, and slug tests

Features:

- o Interactive, menu-driven program design
- o Nonlinear least-squares estimation of aquifer coefficients

==

TEST DESCRIPTION

Data set........... mw2516.dat
Data set title..... Rising Head Slug Test for MW25-16D

Knowns and Constants:
- No. of data points.................. 215
- Radius of well casing............... 0.086
- Radius of well...................... 0.16
- Aquifer saturated thickness......... 418.9
- Well screen length.................. 9
- Static height of water in well...... 21.87
- Log(Re/Rw).......................... 2.963
- A, B, C............................. 3.265, 0.523, 0.000

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	5.7713E-004	+/-	2.0290E-005
y0 =	3.2066E+000	+/-	2.5129E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 210
- Number of estimated parameters.... 2
- Degrees of freedom................ 208
- Residual mean..................... 0.06968
- Residual standard deviation....... 0.1969
- Residual variance................. 0.03877

TEST DESCRIPTION

Data set........... mw2517.dat
Data set title..... Rising Head Slug Test for MW25-17

Knowns and Constants:
- No. of data points.................. 204
- Radius of well casing............... 0.086
- Radius of well...................... 0.33
- Aquifer saturated thickness......... 8.11
- Well screen length.................. 4.5
- Static height of water in well...... 8.11
- Log(Re/Rw).......................... 2.223
- A, B, C............................. 0.000, 0.000, 1.448

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	4.6123E-004	+/-	3.1207E-006
y0 =	1.6365E+000	+/-	2.5003E-003

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 184
- Number of estimated parameters.... 2
- Degrees of freedom................ 182
- Residual mean..................... 0.0056
- Residual standard deviation....... 0.02182
- Residual variance................. 0.000476

TEST DESCRIPTION

Data set........... mw2519.dat
Data set title..... Rising Head Slug Test for MW25-19

Knowns and Constants:
- No. of data points.................. 215
- Radius of well casing............... 0.086
- Radius of well...................... 0.33
- Aquifer saturated thickness......... 8.34
- Well screen length.................. 4.5
- Static height of water in well...... 8.34
- Log(Re/Rw).......................... 2.238
- A, B, C............................. 0.000, 0.000, 1.448

Version 1.10

12/21/95 18:14:22

TEST DESCRIPTION

Data set........... mw263.dat
Data set title..... Rising Head Slug Test for MW26-3

Knowns and Constants:

No. of data points.................. 204
Radius of well casing............... 0.086
Radius of well...................... 0.33
Aquifer saturated thickness......... 4.49
Well screen length.................. 3.79
Static height of water in well...... 4.49
Log(Re/Rw).......................... 1.853
A, B, C............................. 0.000, 0.000, 1.358

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	7.7755E-003	+/-	1.0524E-004
y0 =	2.0315E+000	+/-	1.7912E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:

Number of residuals................ 196
Number of estimated parameters.... 2
Degrees of freedom................ 194
Residual mean..................... 0.02056
Residual standard deviation....... 0.05114
Residual variance................. 0.002616

Model Residuals:

A Q T E S O L V

A Program for

Automatic Estimation of Aquifer Coefficients

From Aquifer Test Data

By:

Glenn M. Duffield
and
James O. Rumbaugh, III

Geraghty & Miller Modeling Group
1895 Preston White Drive, Suite 301
Reston, VA 22091

(703) 476 - 0335

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- confined aquifers, unconfined aquifers, and leaky aquifers
- pumping tests, injection tests, recovery tests, and slug tests

<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<>>

A Q T E S O L V   R E S U L T S
Version 1.10

12/21/95 17:27:06

TEST DESCRIPTION

Data set........... mw264.dat
Data set title..... Rising Head Slug Test for MW26-4

Knowns and Constants:
- No. of data points.................. 22
- Radius of well casing............... 0.086
- Radius of well...................... 0.33
- Aquifer saturated thickness......... 2.94
- Well screen length.................. 1.84
- Static height of water in well...... 2.94
- Log(Re/Rw)......................... 1.49
- A, B, C............................ 0.000, 0.000, 0.938

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	7.0507E-003	+/-	6.7001E-004
y0 =	1.7935E+000	+/-	1.6316E-001

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 22
- Number of estimated parameters.... 2
- Degrees of freedom................ 20
- Residual mean..................... 0.03699
- Residual standard deviation....... 0.08146
- Residual variance................. 0.006636

Model Residuals:

A Q T E S O L V

A Program for

Automatic Estimation of Aquifer Coefficients

From Aquifer Test Data

By:

Glenn M. Duffield
and
James O. Rumbaugh, III

Geraghty & Miller Modeling Group
1895 Preston White Drive, Suite 301
Reston, VA 22091

(703) 476 - 0335

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- o confined aquifers, unconfined aquifers, and leaky aquifers
- o pumping tests, injection tests, recovery tests, and slug tests

Features:

- o Interactive, menu-driven program design
- o Nonlinear least-squares estimation of aquifer coefficients
- o Statistical analysis of results
- o Complete graphical display of results

<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<>>>

==

TEST DESCRIPTION

Data set........... mw266.dat
Data set title..... Rising Head Slug Test for MW26-6

Knowns and Constants:
- No. of data points.................. 197
- Radius of well casing............... 0.086
- Radius of well...................... 0.33
- Aquifer saturated thickness......... 4.49
- Well screen length.................. 3.39
- Static height of water in well...... 4.49
- Log(Re/Rw).......................... 1.826
- A, B, C............................. 0.000, 0.000, 1.297

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	4.0854E-003	+/-	1.2752E-004
y0 =	2.1331E+000	+/-	2.9525E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
- Number of residuals............... 193
- Number of estimated parameters.... 2
- Degrees of freedom................ 191
- Residual mean..................... 0.05662
- Residual standard deviation....... 0.1344
- Residual variance................. 0.01807

Model Residuals:

================================================================================
                              TEST DESCRIPTION

Data set........... mw267.dat
Data set title..... Rising Head Slug Test for MW26-7

Knowns and Constants:
   No. of data points.................. 188
   Radius of well casing............... 0.086
   Radius of well...................... 0.33
   Aquifer saturated thickness......... 6.69
   Well screen length.................. 5.47
   Static height of water in well...... 6.69
   Log(Re/Rw).......................... 2.178
   A, B, C.............................  0.000,  0.000,  1.552

================================================================================
                              ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

================================================================================
                    RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

           Estimate           Std. Error
   K  =   3.6302E-003 +/-    1.7686E-005
   y0 =   3.4484E+000 +/-    7.8199E-003

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
   Number of residuals............... 187
   Number of estimated parameters.... 2
   Degrees of freedom................ 185
   Residual mean..................... 0.002047
   Residual standard deviation....... 0.03578
   Residual variance................. 0.00128

Model Residuals:

     Time         Observed      Calculated     Residual        Weight

TEST DESCRIPTION

Data set........... mw268.dat
Data set title..... Rising Head Slug Test for MW26-8

Knowns and Constants:
- No. of data points.................. 41
- Radius of well casing............... 0.086
- Radius of well...................... 0.33
- Aquifer saturated thickness......... 3.57
- Well screen length.................. 2.37
- Static height of water in well...... 3.57
- Log(Re/Rw).......................... 1.629
- A, B, C............................. 0.000, 0.000, 1.091

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

A Q T E S O L V

A Program for

Automatic Estimation of Aquifer Coefficients

From Aquifer Test Data

By:

Glenn M. Duffield
and
James O. Rumbaugh, III

Geraghty & Miller Modeling Group
1895 Preston White Drive, Suite 301
Reston, VA 22091

(703) 476 - 0335

A Q T E S O L V is a user-friendly program designed to analyze data from aquifer tests automatically. Aquifer coefficients for a variety of aquifer test conditions can be estimated by A Q T E S O L V , including the following:

- confined aquifers, unconfined aquifers,

TEST DESCRIPTION

Data set........... mw2610.dat
Data set title..... Rising Head Slug Test for MW26-10

Knowns and Constants:
No. of data points.................. 240
Radius of well casing............... 0.086
Radius of well...................... 0.33
Aquifer saturated thickness......... 5.25
Well screen length.................. 4.45
Static height of water in well...... 5.25
Log(Re/Rw).......................... 1.982
A, B, C............................. 0.000, 0.000, 1.442

==

ANALYTICAL METHOD

Bouwer-Rice (Unconfined Aquifer Slug Test)

==

RESULTS FROM STATISTICAL CURVE MATCHING

STATISTICAL MATCH PARAMETER ESTIMATES

	Estimate		Std. Error
K =	3.0135E-004	+/-	3.3634E-005
y0 =	1.3820E+000	+/-	3.2601E-002

ANALYSIS OF MODEL RESIDUALS

residual = calculated - observed
weighted residual = residual * weight

Weighted Residual Statistics:
Number of residuals............... 234
Number of estimated parameters.... 2
Degrees of freedom................ 232
Residual mean..................... 0.09889
Residual standard deviation....... 0.3288
Residual variance................. 0.1081

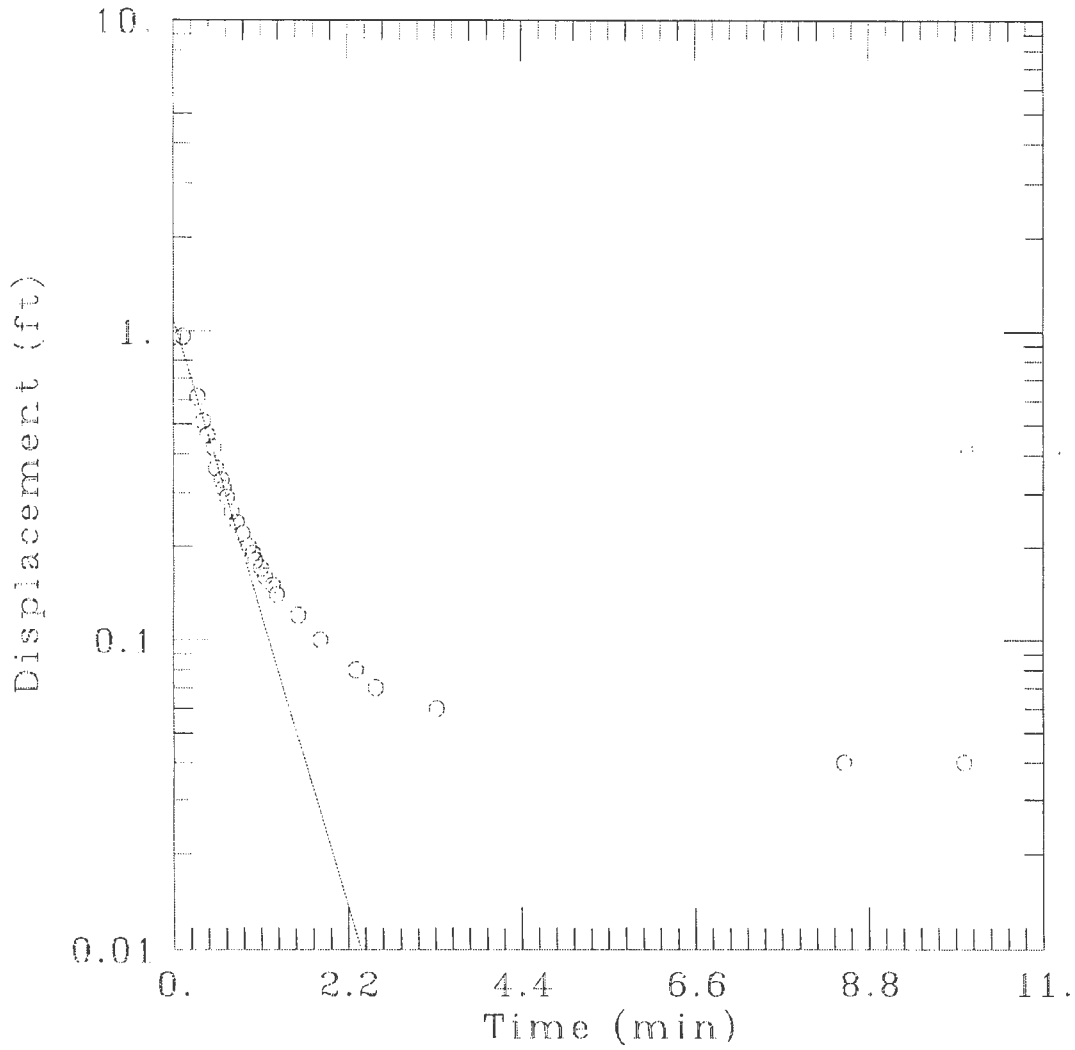
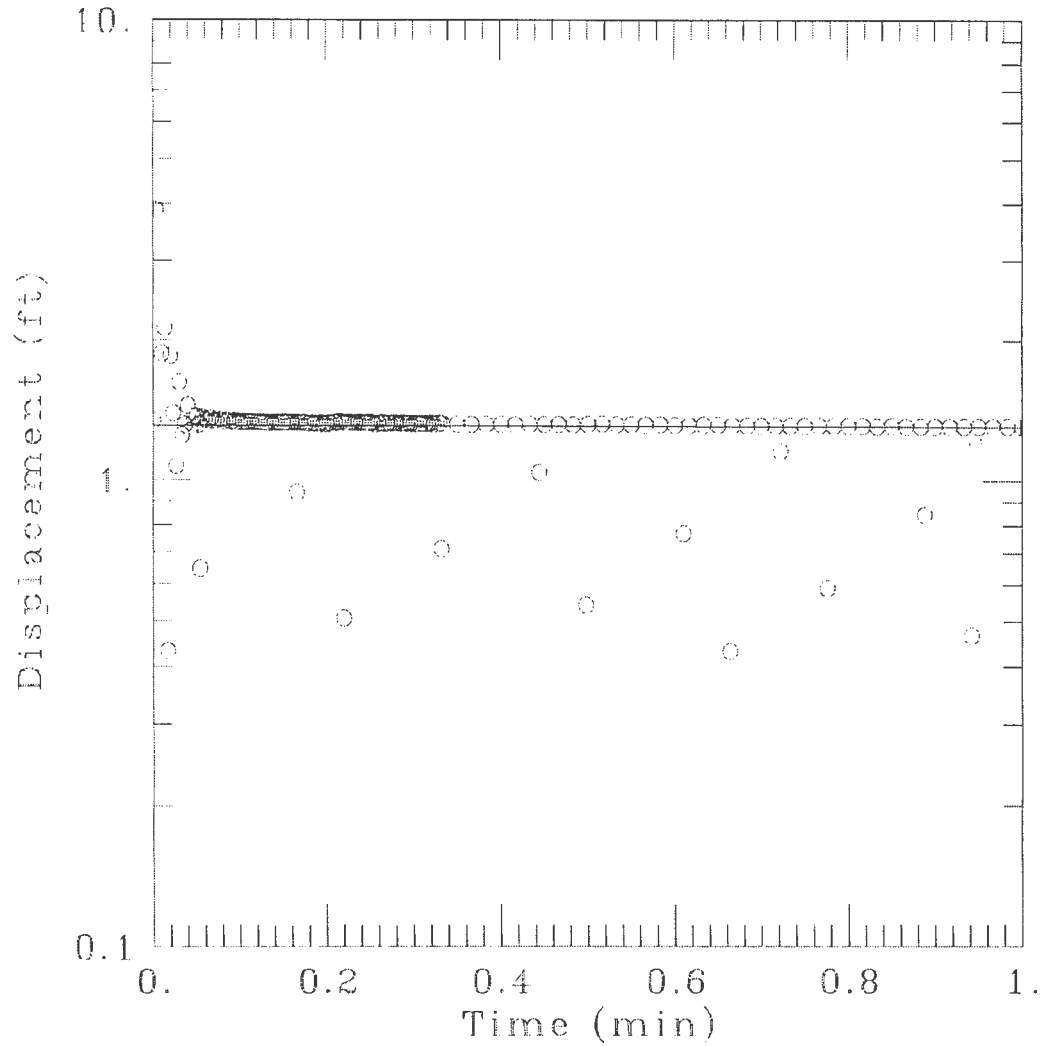
Rising Head Slug Test for MW25-1



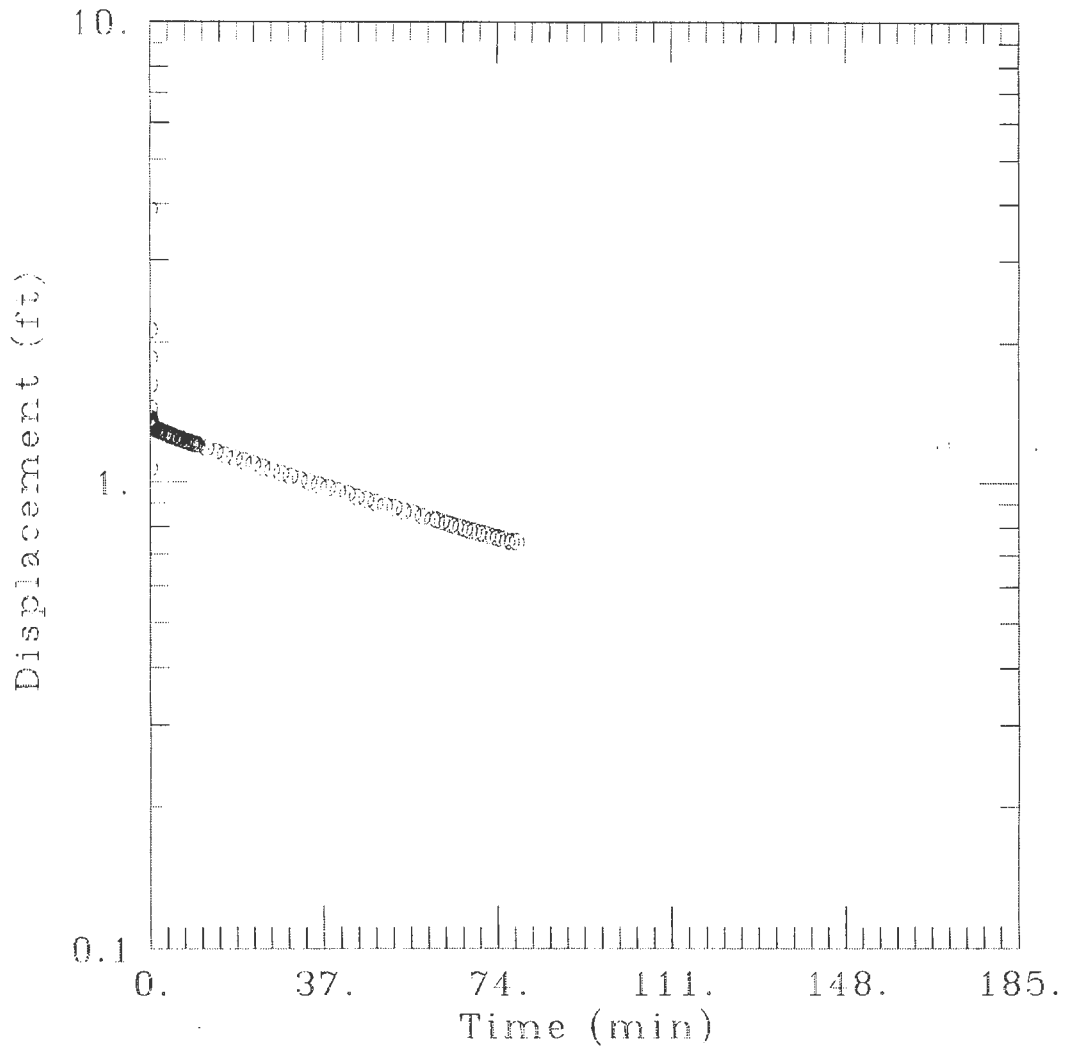
Details of slug test data are provided on Test Description sheets included in this appendix

Rising Head Slug Test for MW25-2



Details of slug test data are provided on Test Description sheets included in this appendix

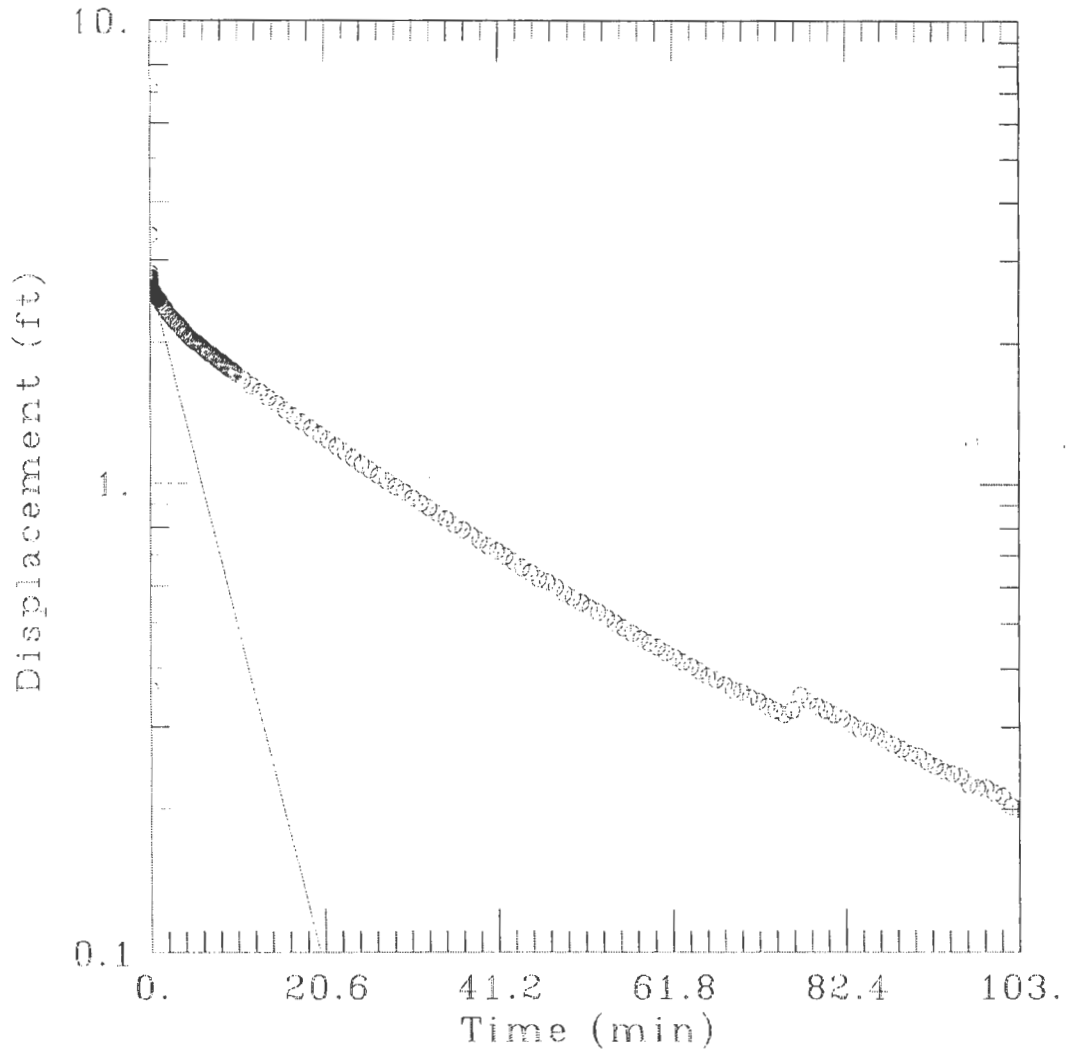
Rising Head Slug Test for MW25-2



Details of slug test data are provided on Test Description sheets included in this appendix

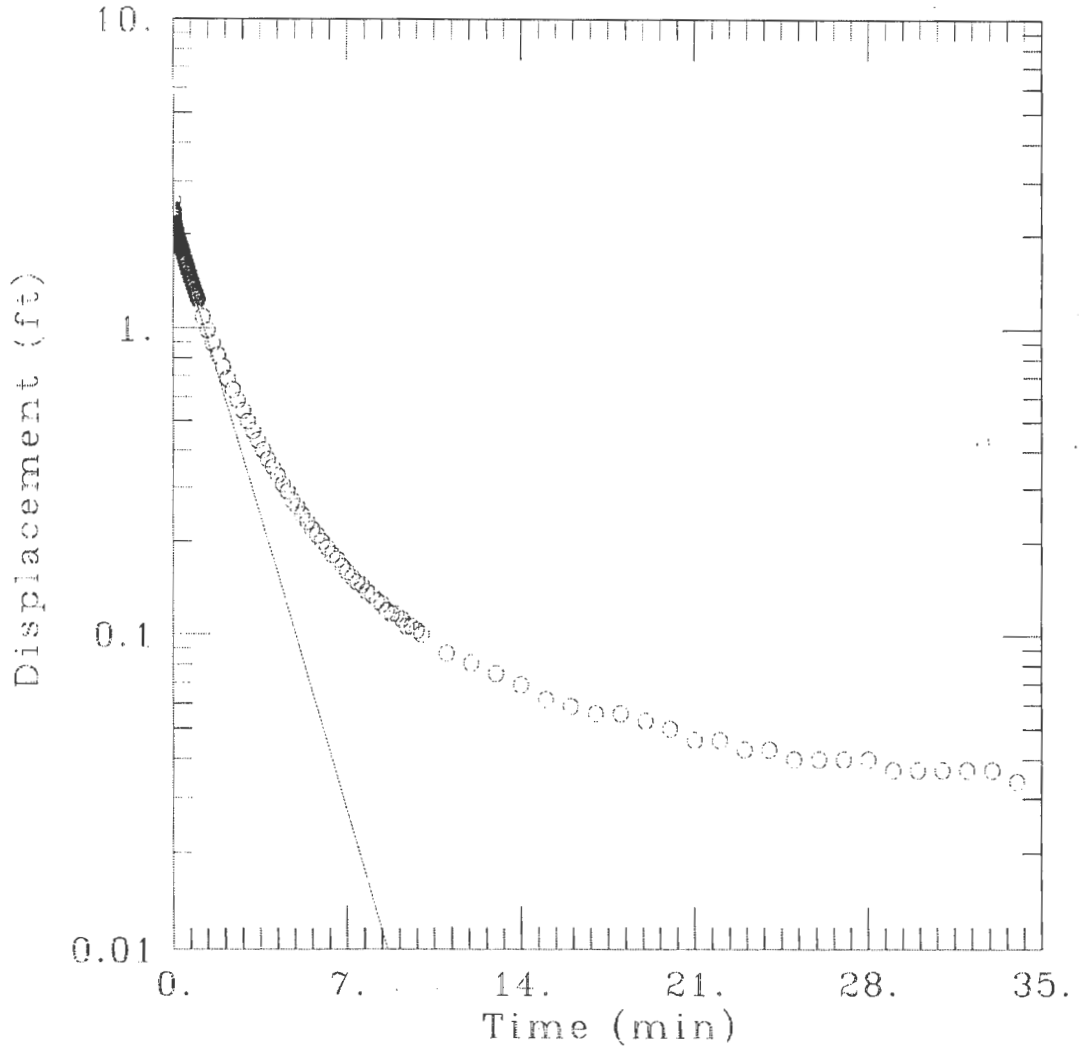
(Note: not all of the data points were saved to the plot file during the export process in Aqtesolv)

Rising Head Slug Test for MW25-3



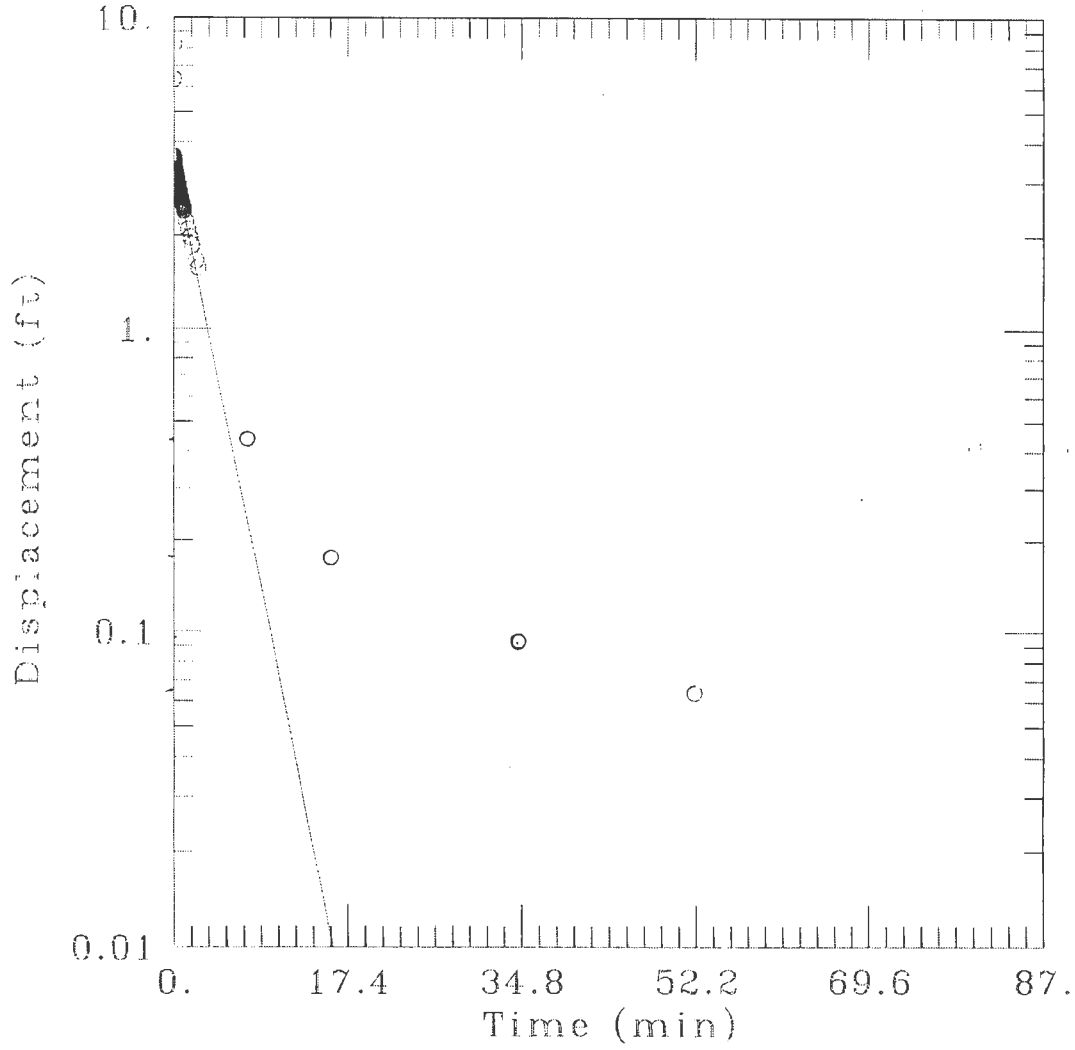
Details of slug test data are provided on Test Description sheets included in this appendix

Rising Head Slug Test for MW25-4D



Details of slug test data are provided on Test Description sheets included in this appendix

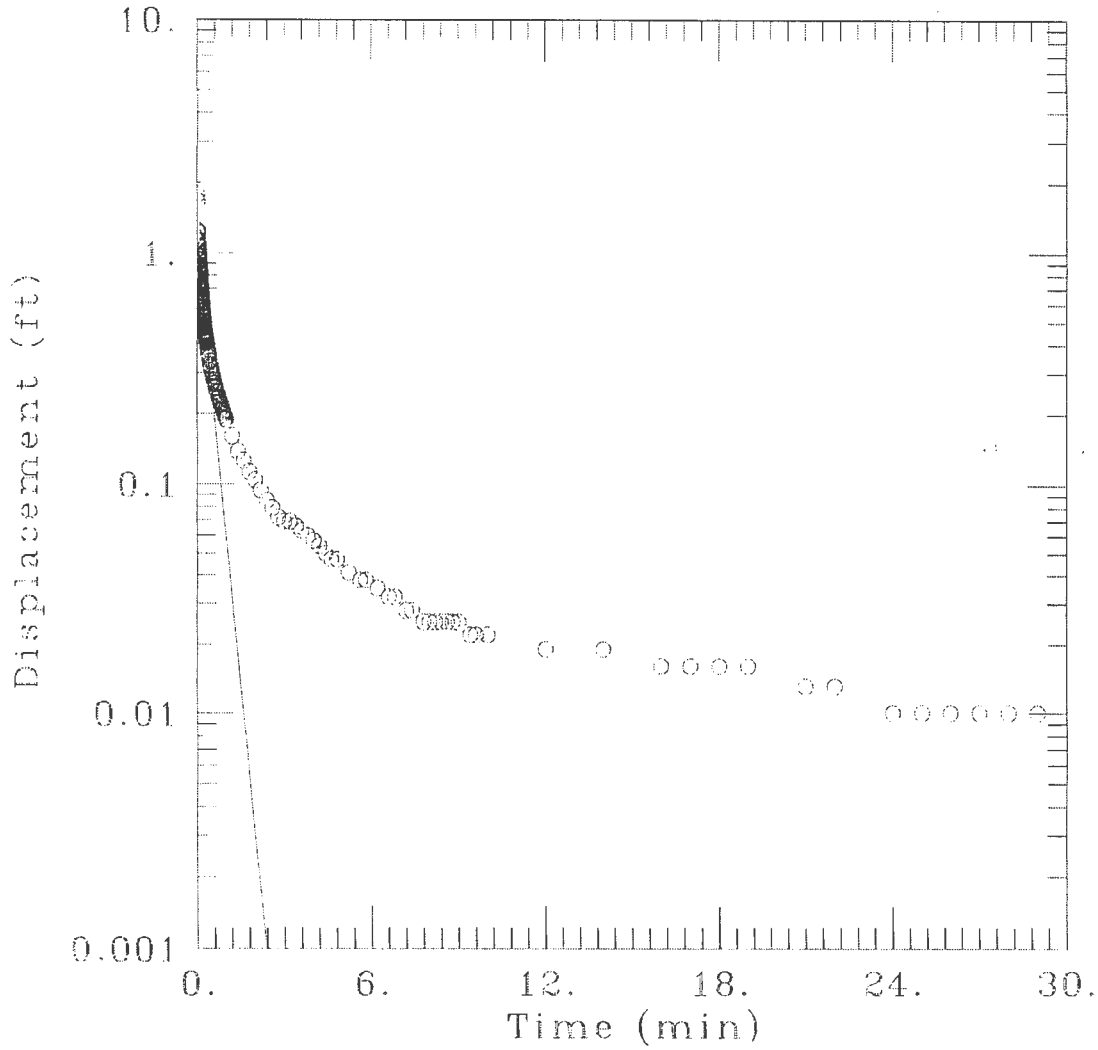
Rising Head Slug Test for MW25-5D



Details of slug test data are provided on Test Description sheets included in this appendix

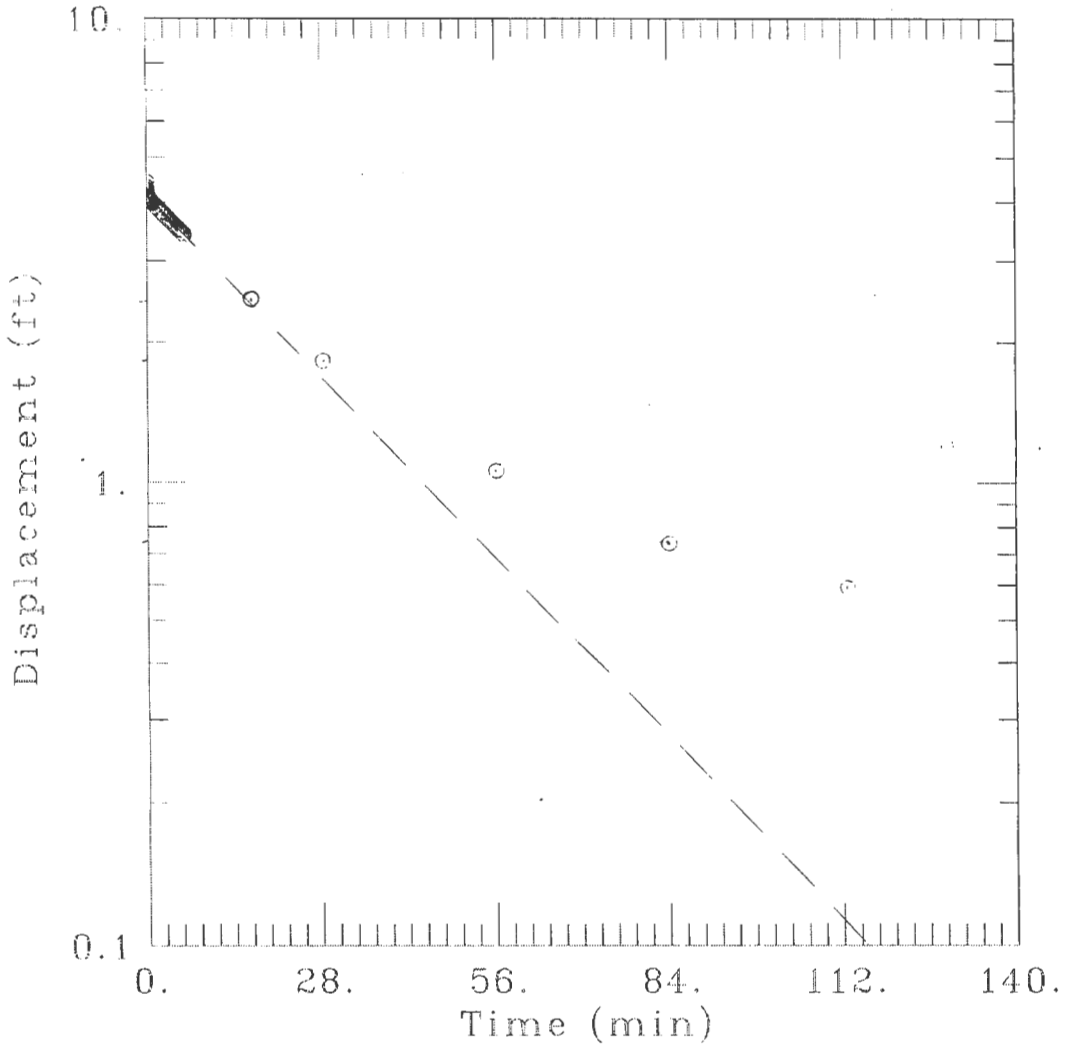
(Note: not all of the data points were saved to the plot file during the export process in Aqtesolv)

Rising Head Slug Test for MW25-6



Details of slug test data are provided on Test Description sheets included in this appendix

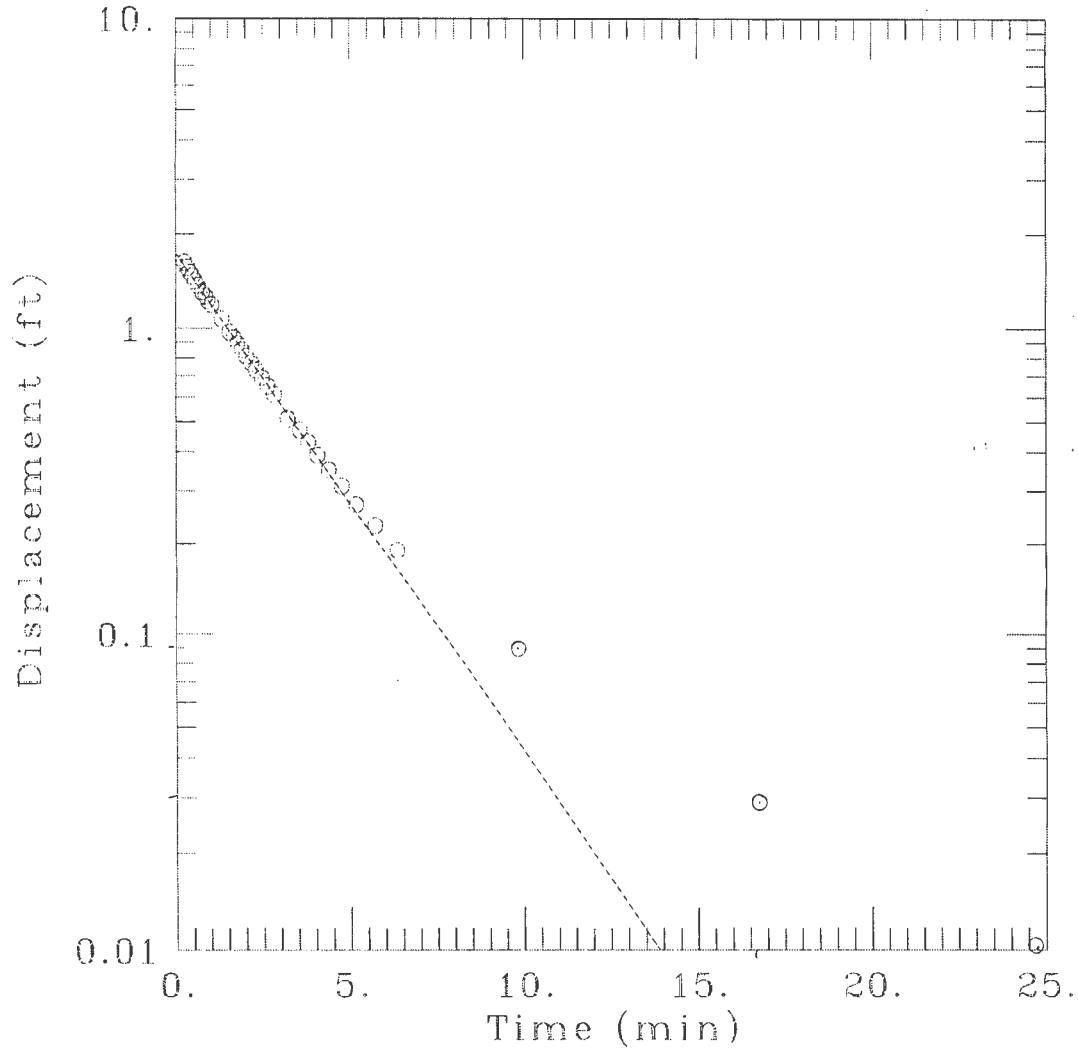
Rising Head Slug Test for MW25-7D



Details of slug test data are provided on Test Description sheets included in this appendix

(Note: not all of the data points were saved to the plot file during the export process in Aqtesolv)

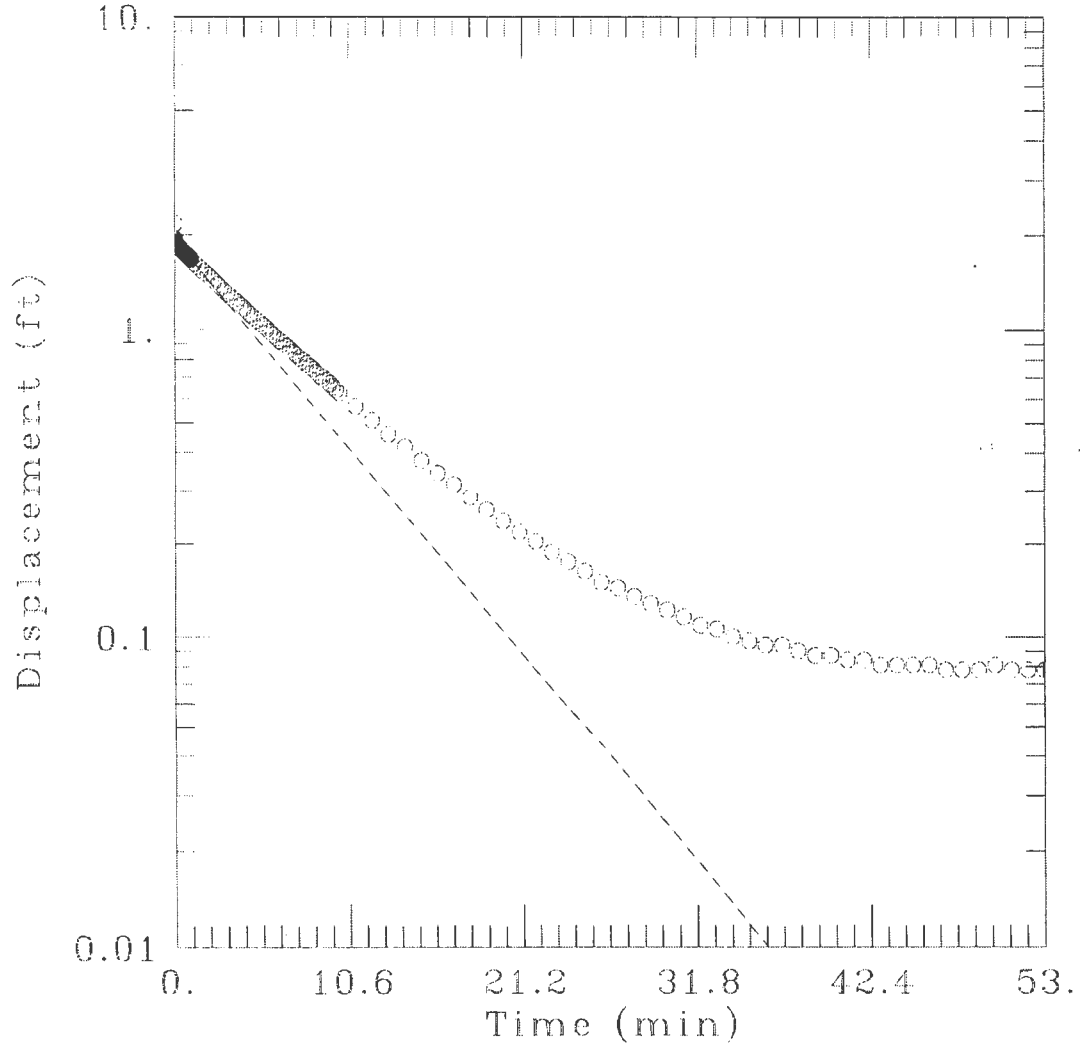
Rising Head Slug Test for MW25-8



Details of slug test data are provided on Test Description sheets included in this appendix

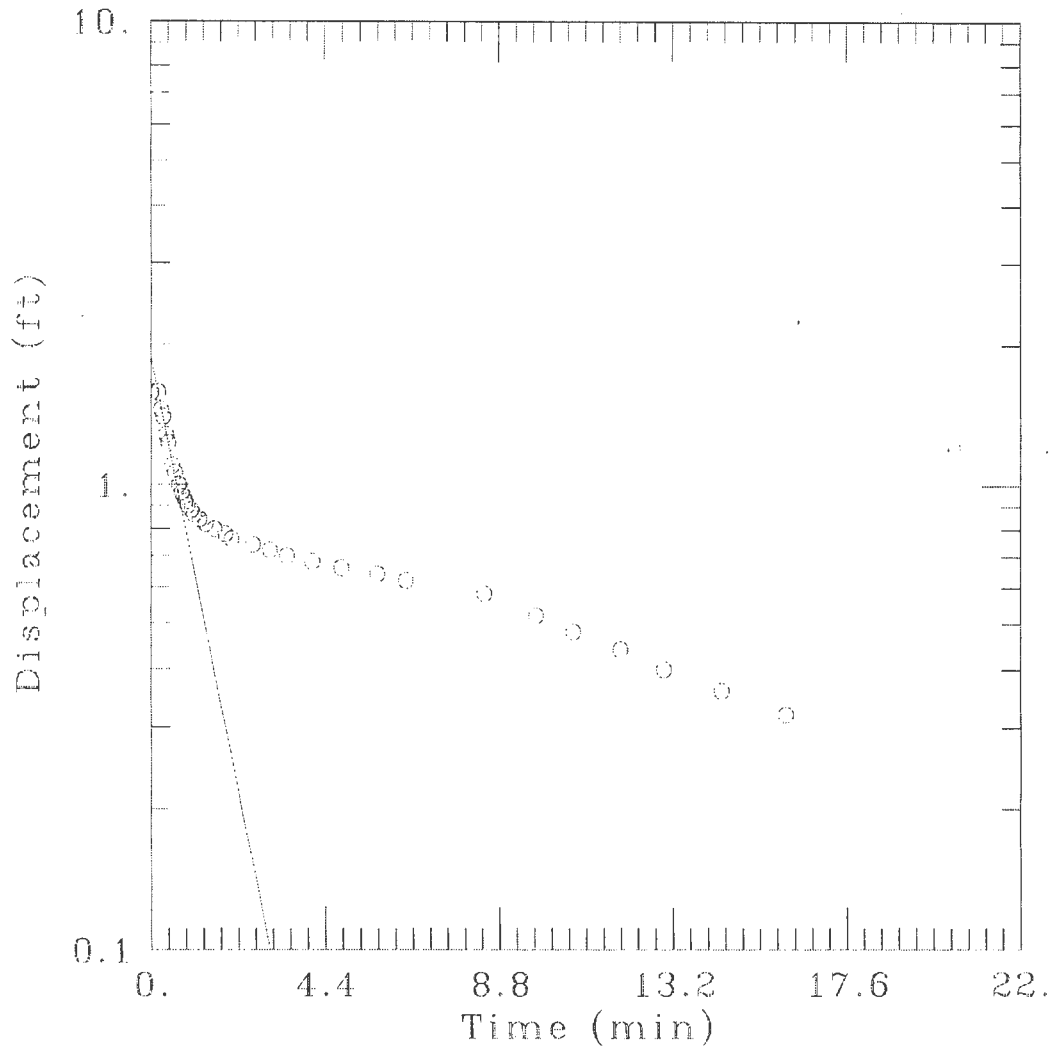
(Note: not all of the data points were saved to the plot file during the export process in Aqtesolv)

Rising Head Slug Test for MW25-9



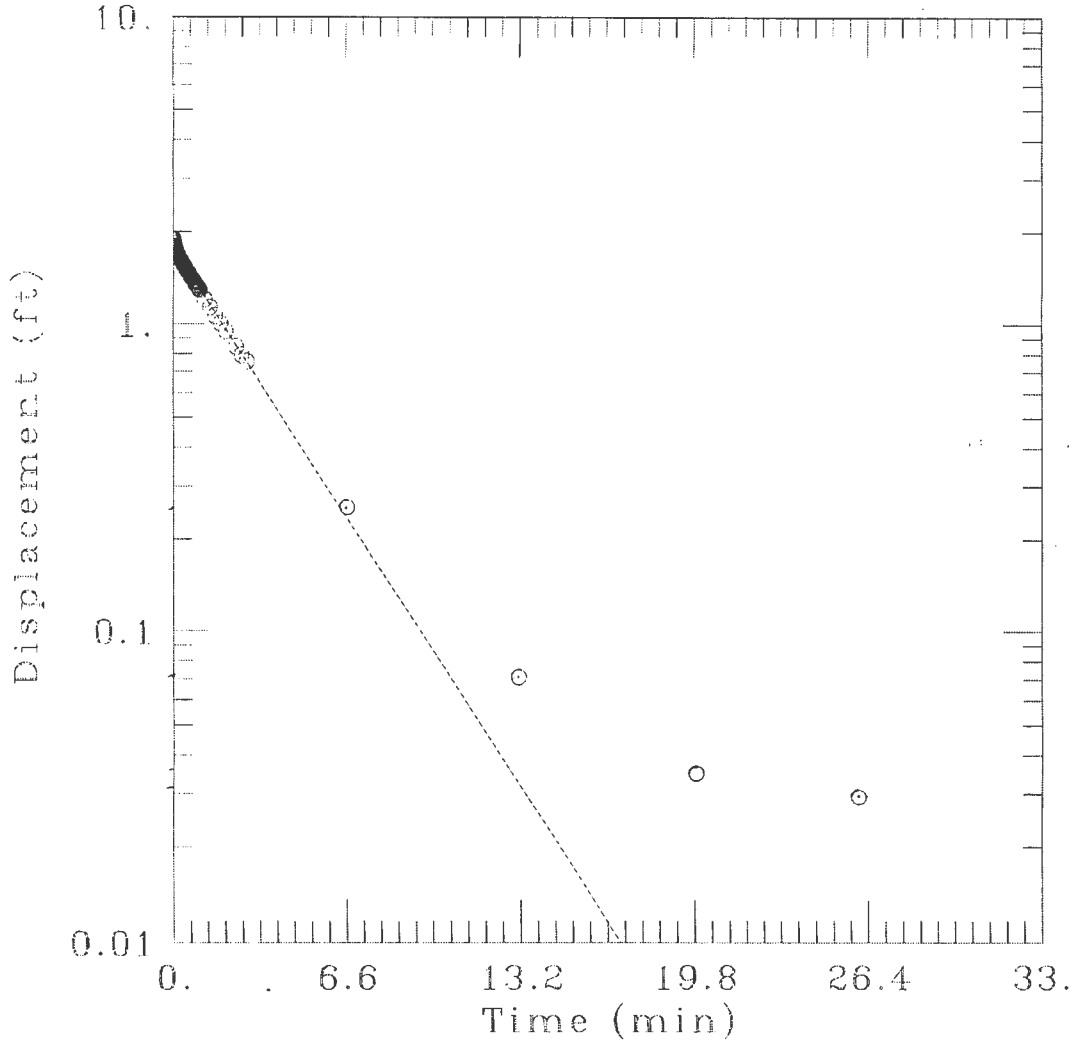
Details of slug test data are provided on Test Description sheets included in this appendix

Rising Head Slug Test for MW25-10



Details of slug test data are provided on Test Description sheets included in this appendix

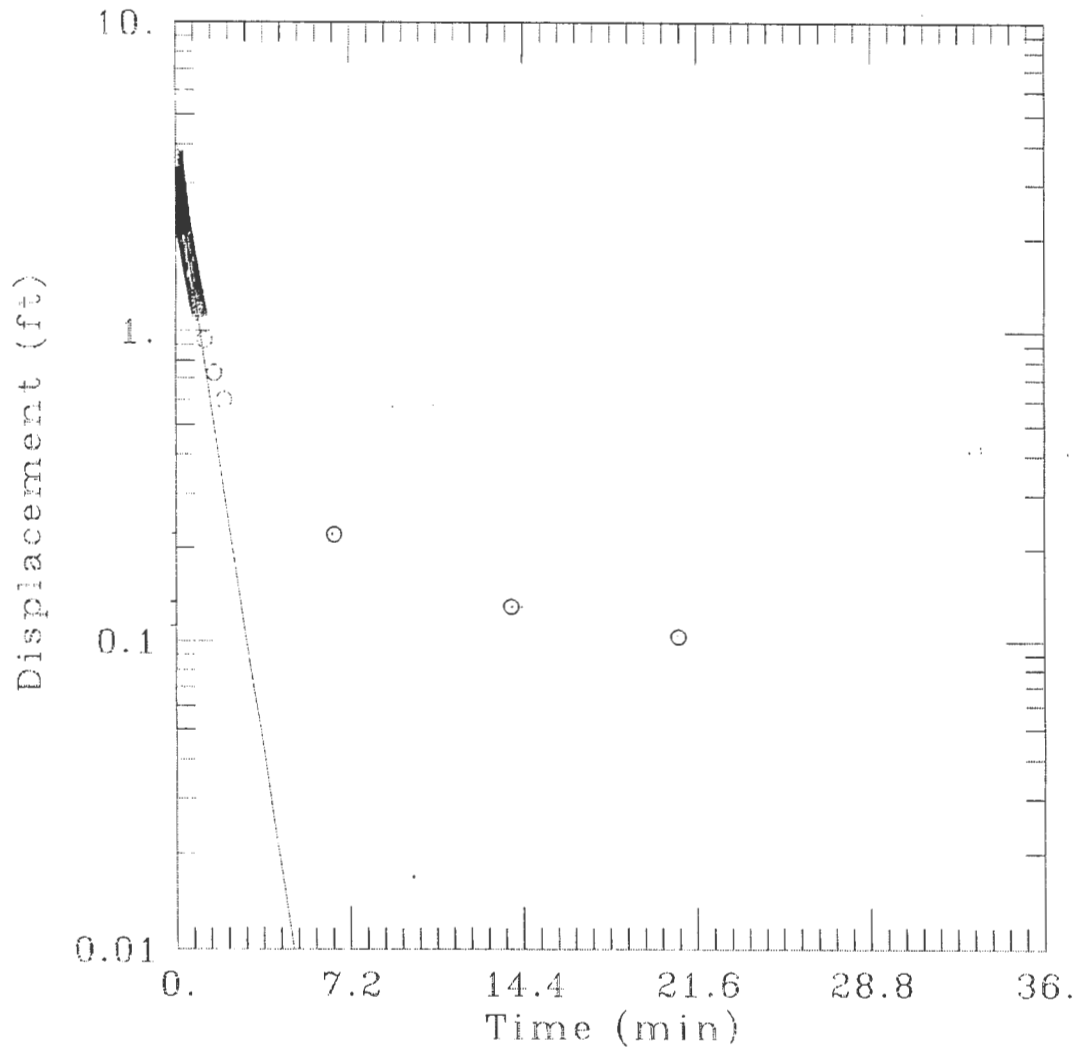
Rising Head Slug Test for MW25-11



Details of slug test data are provided on Test Description sheets included in this appendix

(Note: not all of the data points were saved to the plot file during the export process in Aqtesolv)

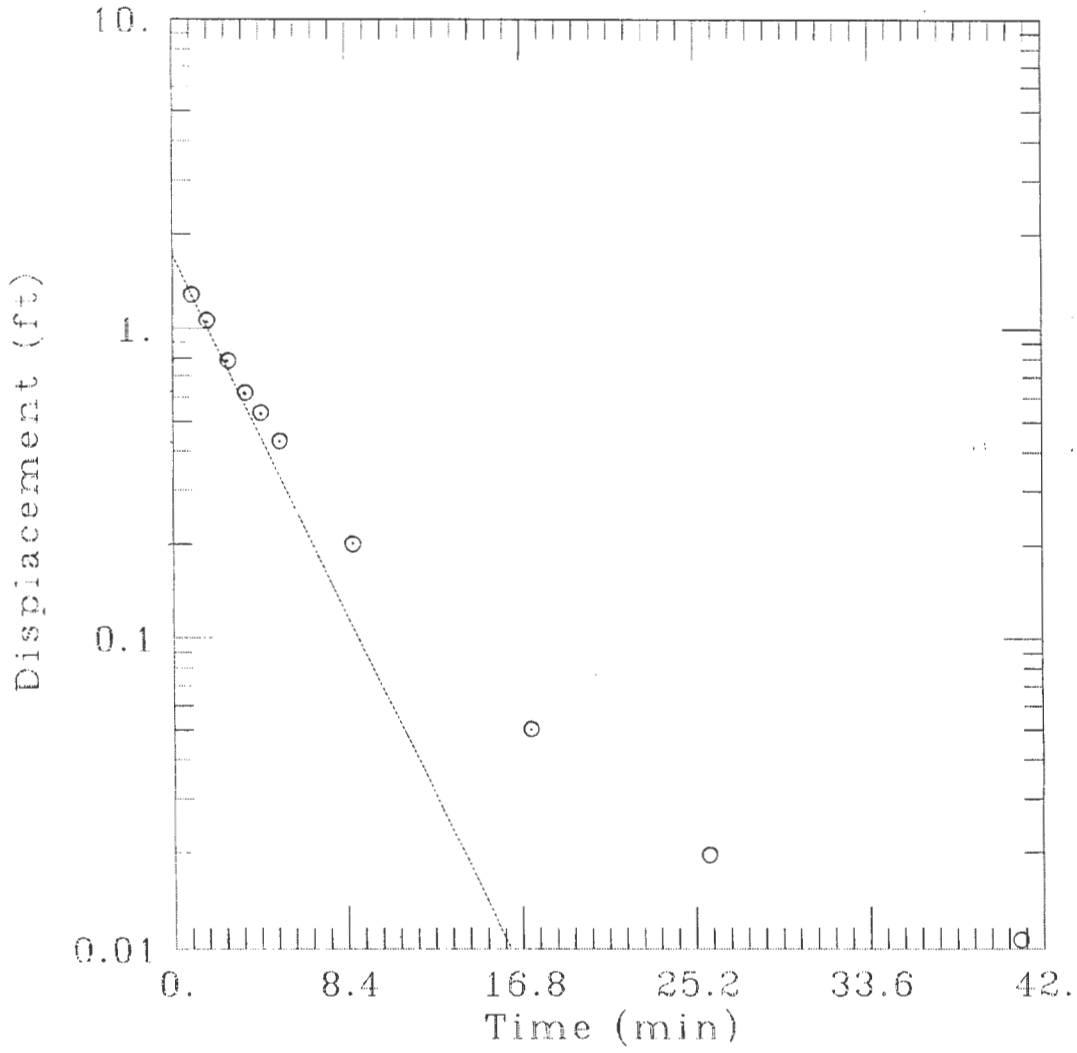
Rising Head Slug Test for MW25-12D



Details of slug test data are provided on Test Description sheets included in this appendix

(Note: not all of the data points were saved to the plot file during the export process in Aqtesolv)

Rising Head Slug Test for MW25-13



Details of slug test data are provided on Test Description sheets included in this appendix

(Note: not all of the data points were saved to the plot file during the export process in Aqtesolv)

Rising Head Slug Test for MW25-14D

United States Department of the Interior

FISH AND WILDLIFE SERVICE
3817 Luker Road
Cortland, New York 13045

June 21, 1994

Mr. Michael Duchesneau
Project Manager
Engineering-Science, Inc.
Prudential Center
Boston, MA 02199

Dear Mr. Duchesneau:

This responds to your letter of May 12, 1994, requesting information on the presence of endangered or threatened species in the vicinity of the Seneca Army Depot located at Romulus, Seneca County, New York.

Except for occasional transient individuals, no Federally listed or proposed endangered or threatened species under our jurisdiction are known to exist in the project impact area. Therefore, no Biological Assessment or further Section 7 consultation under the Endangered Species Act (87 Stat. 884, as amended; 16 U.S.C. 1531 et seq.) is required with the U.S. Fish and Wildlife Service (Service). Should project plans change, or if additional information on listed or proposed species becomes available, this determination may be reconsidered. A compilation of Federally listed and proposed endangered and threatened species in New York is enclosed for your information.

The above comments pertaining to endangered species under our jurisdiction are provided pursuant to the Endangered Species Act. This response does not preclude additional Service comments under the Fish and Wildlife Coordination Act or other legislation.

For additional information on fish and wildlife resources or State-listed species, we suggest you contact:

New York State Department of
Environmental Conservation
Region 8
6274 East Avon-Lima Road
Avon, NY 14414
(716) 226-2466

New York State Department of
Environmental Conservation
Wildlife Resources Center - Information Serv.
New York Natural Heritage Program
700 Troy-Schenectady Road
Latham, NY 12110-2400
(518) 783-3932

The National Wetlands Inventory (NWI) maps of the Dresden, Geneva South, Ovid, and Romulus Quadrangles are now available in draft form and there may be wetlands in the project vicinity. Copies of NWI maps may be obtained through:

CLEARS
Cornell University
464 Hollister Hall
Ithaca, NY 14853
(607) 255-6520

An order form listing the topographic quadrangles that have been mapped in New York State is enclosed for your information. However, while the NWI maps are reasonably accurate, they should not be used in lieu of field surveys for determining the presence of wetlands or delineating wetland boundaries for Federal regulatory purposes.

Work in certain waters and wetlands of the United States may require a permit from the U.S. Army Corps of Engineers (Corps). If a permit is required, in reviewing the application pursuant to the Fish and Wildlife Coordination Act, the Service may concur, with or without stipulations, or recommend denial of the permit depending upon the potential adverse impacts on fish and wildlife resources associated with project implementation. The need for a Corps permit may be determined by contacting Mr. Paul Leuchner, Chief, Regulatory Branch, U.S. Army Corps of Engineers, 1776 Niagara Street, Buffalo, NY 14207 (telephone: (716) 879-4321).

If you have any questions regarding this letter, contact Tom McCartney at (607) 753-9334.

Sincerely,

Mark W. Clough

ACTING FOR

David A. Stilwell
Acting Field Supervisor

FEDERALLY LISTED AND PROPOSED ENDANGERED AND THREATENED SPECIES IN NEW YORK

Common Name	Scientific Name	Status	Distribution
FISHES			
Sturgeon, shortnose*	*Acipenser brevirostrum*	E	Hudson River & other Atlantic coastal rivers
REPTILES			
Turtle, green*	*Chelonia mydas*	T	Oceanic summer visitor coastal waters
Turtle, hawksbill*	*Eretmochelys imbricata*	E	Oceanic summer visitor coastal waters
Turtle, leatherback*	*Dermochelys coriacea*	E	Oceanic summer resident coastal waters
Turtle, loggerhead*	*Caretta caretta*	T	Oceanic summer resident coastal waters
Turtle, Atlantic ridley*	*Lepidochelys kempii*	E	Oceanic summer resident coastal waters
BIRDS			
Eagle, bald	*Haliaeetus leucocephalus*	E	Entire state
Falcon, peregrine	*Falco peregrinus*	E	Entire state - re-establishment to former breeding range in progress
Plover, piping	*Charadrius melodus*	E T	Great Lakes Watershed Remainder of coastal New York
Tern, roseate	*Sterna dougallii dougallii*	E	Southeastern coastal portions of state
MAMMALS			
Bat, Indiana	*Myotis sodalis*	E	Entire state
Cougar, eastern	*Felis concolor couguar*	E	Entire state - probably extinct
Whale, blue*	*Balaenoptera musculus*	E	Oceanic
Whale, finback*	*Balaenoptera physalus*	E	Oceanic
Whale, humpback*	*Megaptera novaeangliae*	E	Oceanic
Whale, right*	*Eubalaena glacialis*	E	Oceanic
Whale, sei*	*Balaenoptera borealis*	E	Oceanic
Whale, sperm*	*Physeter catodon*	E	Oceanic
MOLLUSKS			
Snail, Chittenango ovate amber	*Succinea chittenangoensis*	T	Madison County
Mussel, dwarf wedge	*Alasmidonta heterodon*	E	Orange County - lower Neversink River

* Except for sea turtle nesting habitat, principal responsibility for these species is vested with the National Marine Fisheries Service.

Region 5 - 05/07/93 - 2 pp.

FEDERALLY LISTED AND PROPOSED ENDANGERED AND THREATENED SPECIES IN NEW YORK (Cont'd)

Common Name	Scientific Name	Status	Distribution
BUTTERFLIES			
Butterfly, Karner blue	*Lycaeides melissa samuelis*	E	Albany, Saratoga, Warren, and Schenectady Counties
PLANTS			
Monkshood, northern wild	*Aconitum noveboracense*	T	Ulster, Sullivan, and Delaware Counties
Pogonia, small whorled	*Isotria medeoloides*	E	Entire state
Swamp pink	*Helonias bullata*	T	Staten Island - presumed extirpated
Gerardia, sandplain	*Agalinis acuta*	E	Nassau and Suffolk Counties
Fern, American hart's-tongue	*Phyllitis scolopendrium* var. *americana*	T	Onondaga and Madison Counties
Orchid, eastern prairie fringed	*Platanthera leucophea*	T	Not relocated in New York
Bulrush, northeastern	*Scirpus ancistrochaetus*	E	Not relocated in New York
Roseroot, Leedy's	*Sedum integrifolium* ssp. *Leedyi*	T	West shore of Seneca Lake
Amaranth, seabeach	*Amaranthus pumilus*	T	Atlantic coastal plain beaches

APPENDIX I

ODAST MODEL

Transient Solution to the Advective-Dispersive Equation for One-Dimensional Flow, Type Three Boundary Condition (Decaying Source, Constant Location, Variable Time, Solution of van Genuchten and Alves, 1982) - Checked against Solute ONE3-D by THW 1/5/95

SEAD-25
Benzene

Hydrogeologic Data

Hydraulic conductivtiy	$K := 0.53 \cdot \frac{m}{day}$
Hydraulic gradient	$I := 0.02 \cdot \frac{ft}{ft}$
Effective porosity	$n_e := 0.175$
Total porosity	$n := 0.37$
Longitudinal dispersivity (EPRI, 1985)	$\alpha_x := 3 \cdot m$
Concentration of Injected Contaminant	$C_s := 60.80 \cdot \frac{mg}{liter}$
Initial Dissolved Contaminant Concentration	$C_o := 3.04 \cdot \frac{mg}{liter}$

Retardation Coefficient Calculation

Solute Decay Rate	$\lambda := 0.002 \cdot \frac{1}{day}$
Source Decay Rate	$\gamma := 0.0002 \cdot \frac{1}{day}$
Soil sorption coefficient (EPA, 1990)	$K_{oc} := 83 \cdot \frac{mL}{gm}$
Bulk density (Freeze and Cherry, 1979)	$\rho_b := 1.80 \cdot \frac{gm}{cm^3}$
Organic carbon content	$f_{oc} := 0.62 \cdot \%$
Retardation coefficient	$R := 1 + \frac{\rho_b \cdot K_{oc} \cdot f_{oc}}{n}$ $R = 3.503$

Groundwater Hydraulics Calculations

Groundwater velocity (pore-water)	$v_x := \frac{K \cdot I}{n_e}$	$v_x = 0.061 \cdot \frac{m}{day}$
Contaminant velocity	$v_c := \frac{v_x}{R}$	$v_c = 0.017 \cdot \frac{m}{day}$
Longitudinal dispersion coefficient	$D_x := \alpha_x \cdot v_x$	$D_x = 1.956 \cdot \frac{ft^2}{day}$

Initial Plume Distribution Calculation

week := 7·day i := 1..520 x := 1·m

Δt := 1·week

$t_i := \Delta t \cdot i$

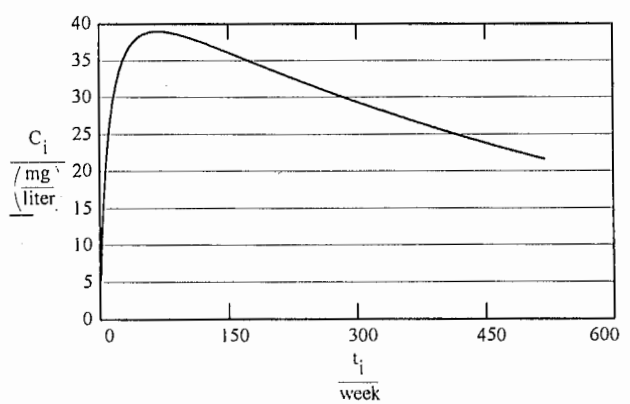
For Retarded Flow with Biodegradation and a Decaying Source (van Genuchten and Alves, 1982)

$$C_i = C_0 \cdot \exp(-\lambda \cdot t_i) \cdot \left[1 - \frac{1}{2} \cdot \left(1 - \operatorname{erf}\left(\frac{R \cdot x - v_x \cdot t_i}{2 \cdot \sqrt{D_x \cdot R \cdot t_i}} \right) \right) - \left(\frac{v_x^2 \cdot t_i}{\pi \cdot D_x \cdot R} \right) \cdot \exp\left[-\frac{(R \cdot x - v_x \cdot t_i)^2}{4 \cdot D_x \cdot R \cdot t_i} \right] + \frac{1}{2} \cdot \left(1 + \frac{v_x \cdot x}{D_x} + \frac{v_x^2 \cdot t_i}{D_x \cdot R} \right) \cdot \exp\left(\frac{v_x \cdot x}{D_x} \right) \cdot \left(1 - \operatorname{erf}\left(\frac{R \cdot x + v_x \cdot t_i}{2 \cdot \sqrt{D_x \cdot R \cdot t_i}} \right) \right) \right] \dots$$

$$+ C_s \cdot \exp(-\gamma \cdot t_i) \cdot \left[\left[\frac{v_x}{v_x + v_x \cdot \sqrt{1 + \frac{4 \cdot D_x \cdot R}{v_x^2} \cdot (\lambda - \gamma)}} \right] \cdot \exp\left[\frac{\left[v_x - v_x \cdot \sqrt{1 + \frac{4 \cdot D_x \cdot R}{v_x^2} \cdot (\lambda - \gamma)} \right] \cdot x}{2 \cdot D_x} \right] \cdot \left[1 - \operatorname{erf}\left[\frac{R \cdot x - t_i \cdot \left[v_x \cdot \sqrt{1 + \frac{4 \cdot D_x \cdot R}{v_x^2} \cdot (\lambda - \gamma)} \right]}{2 \cdot \sqrt{D_x \cdot R \cdot t_i}} \right] \right] \dots \right.$$

$$+ \left[\frac{v_x}{v_x - v_x \cdot \sqrt{1 + \frac{4 \cdot D_x \cdot R}{v_x^2} \cdot (\lambda - \gamma)}} \right] \cdot \exp\left[\frac{\left[v_x - v_x \cdot \sqrt{1 + \frac{4 \cdot D_x \cdot R}{v_x^2} \cdot (\lambda - \gamma)} \right] \cdot x}{2 \cdot D_x} \right] \cdot \left[1 - \operatorname{erf}\left[\frac{R \cdot x + t_i \cdot v_x \cdot \sqrt{1 + \frac{4 \cdot D_x \cdot R}{v_x^2} \cdot (\lambda - \gamma)}}{2 \cdot \sqrt{D_x \cdot R \cdot t_i}} \right] \right] \dots$$

$$\left. + \left[\frac{v_x^2}{2 \cdot D_x \cdot R \cdot (\lambda - \gamma)} \right] \cdot \exp\left[\frac{v_x \cdot x}{D_x} - (\lambda - \gamma) \cdot t_i \right] \cdot \left(1 - \operatorname{erf}\left(\frac{R \cdot x + v_x \cdot t_i}{2 \cdot \sqrt{D_x \cdot R \cdot t_i}} \right) \right) \right]$$



SEAD-25
TCE

Transient Solution to the Advective-Dispersive Equation for One-Dimensional Flow, Type Three Boundary Condition (Decaying Source, Constant Location, Variable Time, Solution of van Genuchten and Alves, 1982) - Checked against Solute ONE3-D by THW 1/5/95

Hydrogeologic Data

Hydraulic conductivtiy	$K := 0.53 \cdot \frac{m}{day}$

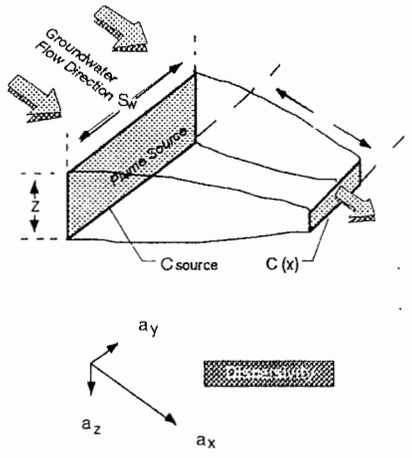
APPENDIX I

SCREEN 3 MODEL RUNS
SEAD-25 / SEAD-26

APPENDIX A.1 DOMENICO ANALYTICAL MODEL

The Domenico (1987) analytical model, used by BIOSCREEN, is designed for the multidimensional transport of a decaying contaminant species. The model equation, boundary conditions, assumptions, and limitations are discussed below.

Domenico Model with Instantaneous Reaction Superposition Algorithm



$$\frac{C(x,y,o,t)}{(Co+BC)} = \frac{1}{8}\exp\left[\frac{x}{\alpha_x 2}\left(1-\left(1+4\lambda\alpha_x/v\right)^{1/2}\right)\right] erfc\left[\frac{\left(x-vt\left(1+4\lambda\alpha_x/v\right)^{1/2}\right)}{2(\alpha_x vt)^{1/2}}\right]$$

$$\left\{erf\left[\frac{(y+Y/2)}{2(\alpha_y x)^{1/2}}\right]-erf\left[\frac{(y-Y/2)}{2(\alpha_y x)^{1/2}}\right]\right\}$$

$$\left\{erf\left[\frac{(Z)}{2(\alpha_z x)^{1/2}}\right]-erf\left[\frac{(-Z)}{2(\alpha_z x)^{1/2}}\right]\right\}-BC$$

where: $v=\frac{K\cdot i}{\theta_e R}$ $\qquad BC=\Sigma\ \frac{C(ea)_n}{UF_n}$

Definitions

BC	Biodegradation capacity (mg/L)
C(x,y,z,t)	Concentration at distance x downstream of source and distance y off centerline of plume at time t (mg/L)
C_S	Concentration in Source Zone (mg/L)
Co	Concentration in Source Zone at t=0 (mg/L)
x	Distance downgradient of source (ft)
y	Distance from plume centerline of source (ft)
z	Distance from surface to measurement point (assumed to be 0; concentration is always assumed to be at top of water table).
$C(ea)_n$	Concentration of electron acceptor n in groundwater (mg/L)
UF_n	Utilization factor for electron acceptor *n* (i.e., mass ratio of electron acceptor to hydrocarbon consumed in biodegradation reaction)
α_x	Longitudinal groundwater dispersivity (ft)
α_y	Transverse groundwater dispersivity (ft)
α_z	Vertical groundwater dispersivity (ft)
θ_e	Effective Soil Porosity
λ	First-Order Degradation Rate (day^{-1})
υ	Groundwater Seepage Velocity (ft/yr)
K	Hydraulic Conductivity (ft/yr)
R	Constituent retardation factor
i	Hydraulic Gradient (cm/cm)
Y	Source Width (ft)
Z	Source Depth (ft)

The initial conditions are:

1) $c(x, y, z, 0) = 0$ (Initial concentration = 0 for x, y, z, > 0)
2) $c(0, Y, Z, 0) = C_0$ (Source concentration for each vertical plane source = C_0 at time 0)

The key assumptions in the model are:

1) The aquifer and flow field are homogenenous and isotropic.
2) The groundwater velocity is fast enough that molecular diffusion in the dispersion terms can be ignored (may not be appropriate for simulation of transport through clays).
3) Adsorption is a reversible process represented by a linear isotherm.

The key limitations to the model are:

1) The model should not be applied where pumping systems create a complicated flow field.
2) The model should not be applied where vertical flow gradients affect contaminant transport.
3) The model should not be applied where hydrogeologic conditions change dramatically over the simulation domain.

The most important modifications to the original Domenico model are:

1) The addition of "layer cake" source terms where three Domenico models are superimposed one on top of another to yield the 5-source term used in BIOSCREEN (see Connor et al., 1994; and the Source Width description in the BIOSCREEN Data Entry Section).
2) Addition of the instantaneous reaction term using the superposition algorithm (see Appendix A.2, below). For the instantaneous reaction assumption, the source concentration is assumed to be an "effective source concentration" (Coe) equal to the observed concentration in the source zone plus the biodegradation capacity (see "Source Concentration" on the BIOSCREEN Data Entry section).

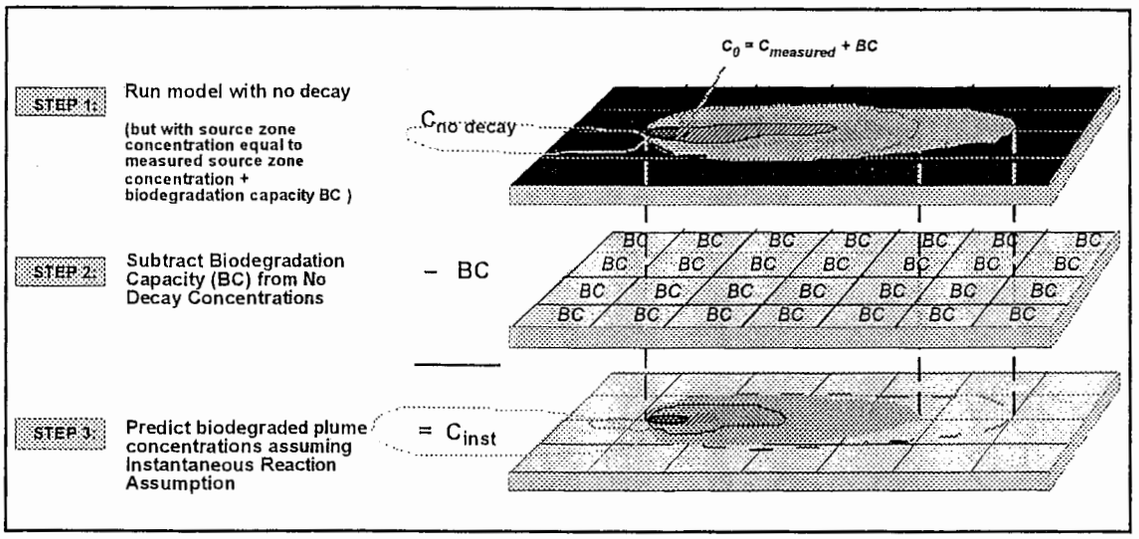
APPENDIX A.2 INSTANTANEOUS REACTION - SUPERPOSITION ALGORITHM

Early biodegradation research focused on the role of dissolved oxygen in controlling the rate of biodegradation in the subsurface (Borden *et al.*, 1986; Lee *et al*, 1987). Because microbial biodegradation kinetics are relatively fast in comparison to the rate of oxygen transport in the groundwater flow system, Borden demonstrated that the biodegradation process can be simulated as an instantaneous reaction between the organic contaminant and oxygen. This simplifying assumption was incorporated into the BIOPLUME I numerical model which calculated organic mass loss by superposition of background oxygen concentrations onto the organic contaminant plume. In BIOPLUME II, a dual-particle mover procedure was incorporated to more accurately simulate the separate transport of oxygen and organic contaminants within the subsurface (Rifai *et al*, 1987; Rifai, *et al*, 1988).

In most analytical modeling applications, contaminant biodegradation is estimated using a first-order decay equation with the biodecay half-life values determined from research literature or site data. However, by ignoring oxygen limitation effects such first-order expressions can significantly overestimate the rate and degree of biodegradation, particularly within low-flow regimes where the rate of oxygen exchange in a groundwater plume is very slow (Rifai, 1994). As a more accurate method of analysis, Newell recommended incorporation of the concept of oxygen superposition into an analytical model (Connor et al., 1994) in a manner similar to that employed in the original BIOPLUME model (Borden *et al.* 1986). By this method, contaminant mass concentrations at any location and time within the flow field are corrected by subtracting 1 mg/L organic mass for each 3 mg/L of background oxygen, in accordance with the instantaneous reaction assumption. Borden *et al* (1986) concluded this simple superposition technique was an exact replacement for more sophisticated oxygen-limited models, as long as the oxygen and the hydrocarbon had the same transport rates (e.g., retardation factor, R = 1).

In their original work, Borden *et al.* (1986) noted that for highly sorptive contaminants the oxygen-superposition method might erroneously characterize biodegradation due to the differing transport rates of dissolved oxygen and the organic contaminant within the aquifer matrix. However, as demonstrated by Connor *et al.* (1994), the oxygen superposition method and BIOPLUME II (dual particle transport) are in reasonable agreement for contaminant retardation factors as high as 6. Therefore, the superposition method can be employed as a reasonable approximation in BIOSCREEN regardless of contaminant sorption characteristics.

BIOSCREEN employs the same superposition approach for all of the aerobic and anaerobic biodegradation reactions (based on evaluation of O_2, NO_3, SO_4, Fe^{2+}, and CH_4). Based on work reported by Newell *et al.* (1995), the anaerobic reactions (nitrate, ferric iron, and sulfate reduction and methanogenesis) are amenable to simulation using the instantaneous reaction assumption. The general approach is presented below:



Based on the biodegradation capacity of electron acceptors present in the groundwater system, this algorithm will correct the non-decayed groundwater plume concentrations predicted by the Domenico model (Appendix A.1) for the effects of organic constituent biodegradation.

To summarize:

1) The original BIOPLUME model (Borden *et al.* 1986) used a superposition method to simulate the fast or "instantaneous" reaction of dissolved hydrocarbons with dissolved oxygen in groundwater.
2) Borden *et al.* (1986) reported that this version of BIOPLUME was mathematically exact for the case where the retardation factor of the contaminant was 1.0.
3) Rifai and Bedient (1990) developed the BIOPLUME II model with a dual-particle tracking routine that expanded the original BIOPLUME model to handle contaminants with retardation factors other than 1.0, in addition to other improvements.
4) Connor et al. (1994) compared the superposition method with the more sophisticated BIOPLUME II model and determined that the two approaches yielded very similar results for readily biodegradable contaminants with retardation factors between 1.0 and 6.0.
5) BIOSCREEN was developed using the superposition approach to simulate the "instantaneous" reaction of aerobic and anaerobic reactions in groundwater. The biodegradation term in BIOSCREEN is mathematically identical to the approach used in the original BIOPLUME model. This mathematical approach (superposition) matches the more sophisticated BIOPLUME II model very closely for readily biodegradable contaminant retardation factors of up to 6.0. BIOSCREEN simulations using the instantaneous reaction assumption at sites with retardation factors greater than 6.0 should be performed with caution and verified using a more sophisticated model such as BIOPLUME III.

APPENDIX A.3 DERIVATION OF SOURCE HALF-LIFE

Purpose: Determine the source half-life relationship used in BIOSCREEN (see Source Half-Life discussion in BIOSCREEN Data Entry Section, pg 30).

Given:

1) There is a finite amount of soluble organic compounds in source zone (the area with contaminated soils and either free-phase or residual NAPL.

2) These organics dissolve slowly as fresh groundwater passes through source zone. Assume the change in mass due to dissolution can be approximated as a first order process:

$$M(t) = M_0 e^{-k_s t} \qquad (1)$$

Procedure:

1) Calculate initial mass of dissolvable organics in source zone, M_0

2) Determine initial source concentration from monitoring well data, C_0

3) Apply conservation of mass to a control surface containing source zone.

4) Set the expressions for mass at time $t \geq 0$ based on dissolution and conservation of mass equal to each other and solve for an expression describing the concentration at time $t \geq 0$.

5) Apply initial conditions for concentration at time $t=0$ and solve for the first order decay constant, k_s.

Assumptions:

1) Groundwater flowrate is constant, $Q(t)=Q_0$

2) Groundwater flowing through the source zone is free of organic compounds. This implies that no mass is added to the system, only dissolution occurs.

Calculations:

1) Calculate initial mass of dissolved/soluble organic compound, M_0 by using procedure described under "Soluble Mass in NAPL, Soil" page in BIOSCREEN Data Input section.

2) Determine initial concentration, C_0 of organic compound in groundwater leaving the source zone. This may be a spatial average, maximum value, or other value representative of the groundwater concentration leaving the source area. (Note that for the instantaneous reaction assumption, C_0 equals the concentration observed in monitoring wells plus the biodegradation capacity to account for rapid biodegradation reactions in the source zone. See "Soluble Mass in NAPL, Soil" page in BIOSCREEN Data Input section).

$$C(t=0) = C_0 \qquad (2)$$

3) Apply conservation of mass to a control surface that contains the source zone. The mass present in the source zone at time $t \geq 0$ is the initial mass plus the change in mass.

$$M(t) = M_0 + \int\int_{C.S.} \int_t Q(t)\ C(t)\ dt\ dA \qquad (3)$$

DERIVATION OF SOURCE HALF-LIFE, Cont'd

Applying the assumptions equation (3) simplifies to

$$M(t) = M_0 - \int_t Q_0\ C(t)\ dt \qquad (4)$$

4) Set the two expressions for mass of organic compound in the source zone at time $t \geq 0$ (equations (1) and (4)) equal to each other and solve for an expression describing the concentration leaving the source zone.

$$M_0\ e^{-k_s t} = M_0 - \int_t Q_0\ C(t)\ dt \qquad (5)$$

$$\frac{d}{dt}\left[\int_t Q_0\ C(t)dt = M_0 - M_0 e^{-k_s t}\right] \qquad (6)$$

$$Q_0\ C(t) = k_s\ M_0\ e^{-k_s t} \qquad (7)$$

$$C(t) = \frac{k_s M_0}{Q_0}\ e^{-k_s t} \qquad (8)$$

5) Apply the initial condition for concentration leaving the source zone at time $t=0$, *eqn (2)* to the expression for $C(t)$, *eqn (8)* and solve for the first order decay coefficient, k_s

$$C_0 = \frac{k_s M_0}{Q_0} \qquad (9)$$

$$\therefore \quad k_s = \frac{Q_0 C_0}{M_0} \qquad (11)$$

Summary: The decay coefficient for the source zone in BIOSCREEN is:

$$k_s = \frac{Q_0 C_0}{M_0}$$

The expression for mass at any time $t \geq 0$ is:

$$M(t) = M_0\ e^{-k_s t}$$

Similarly the expression for source zone concentration any time $t \geq 0$ is:

$$C(t) = C_0\ e^{-k_s t}$$

Acknowledgments: *Original derivation developed by C. Newell. Detailed derivation developed by Xiaoming Liu, Anthony Holder, and Thomas Reeves.*

APPENDIX A.4 DISPERSIVITY ESTIMATES

Dispersion refers to the process whereby a plume will spread out in a longitudinal direction (along the direction of groundwater flow), transversely (perpendicular to groundwater flow), and vertically downwards due to mechanical mixing in the aquifer and chemical diffusion. Selection of dispersivity values is a difficult process, given the impracticability of measuring dispersion in the field. However, dispersivity data from over 50 sites has been compiled by Gelhar *et al.* (1992) (see figures A.1 and A.2, next page).

The empirical data indicates that longitudinal dispersivity, in units of length, is related to scale (distance between source and measurement point; the plume length; Lp in BIOSCREEN). Gelhar *et al.* 1992) indicate there is a considerable range of dispersivity values at any given scale (on the order of 2 - 3 orders of magnitude), 2) suggest using values at the low end of the range of possible dispersivity values, and 3) caution against using a single relationship between scale and dispersivity to estimate dispersivity. However, most modeling studies do start with such simple relationships, and BIOSCREEN is programmed with some commonly used relationships representative of typical and low-end dispersivities:

- Longitudinal Dispersivity

  Alpha x $= 3.28 \cdot 0.83 \cdot \left[\log_{10}\left(\frac{L_p}{3.28}\right)\right]^{2.414}$ *(Xu and Eckstein, 1995)*

  (L_p in ft)

- Transverse Dispersivity

  Alpha y= 0.10 alpha x *(Based on high reliability points from Gelhar et al., 1992)*

- Vertical Dispersivity

  Alpha z = very low (i.e. 1 x e-99 ft) *(Based on conservative estimate*

Other commonly used relationships include:

Alpha x	= 0.1 Lp	*(Pickens and Grisak, 1981)*
Alpha y	= 0.33 alpha x	*(ASTM, 1995) (EPA, 1986)*
Alpha z	= 0.05 alpha x	*(ASTM, 1995)*
Alpha z	= 0.025 alpha x to 0.1 alpha x	*(EPA, 1986)*

The BIOSCREEN input screen includes Excel formulas to estimate dispersivities from scale. BIOSCREEN uses the Xu and Eckstein (1995) algorithm for estimating longitudinal dispersivities because 1) it provides lower range estimates of dispersivity, especially for large values of Lp, and 2) it was developed after weighting the reliability of the various field data compiled by Gelhar *et al.*. (1992) (see Figure A.1). BIOSCREEN also employs low-end estimates for transverse and vertical dispersivity estimates (0.10 alpha x and 0, respectively) because: 1) these relationships better fit observed field data reported by Gelhar *et al.* to have high reliability (see Figure A.2), 2) Gelhar *et al.* recommend use of values in the lower range of the observed data, and 3) better results were realized when calibrating BIOSCREEN to actual

field sites using lower dispersivities. The user can override these formulas by directly entering dispersivity values in the input screen cell.

Note that the Domenico model and BIOSCREEN are not formulated to simulate the effects of chemical diffusion. Therefore, contaminant transport through very slow hydrogeologic regimes (e.g., clays and slurry walls) should probably not be modeled using BIOSCREEN unless the effects of chemical diffusion are proven to be insignificant. Domenico and Schwartz (1990) indicate that chemical diffusion is small for Peclet numbers (seepage velocity times median pore size divided by the bulk diffusion coefficient) greater than 100.

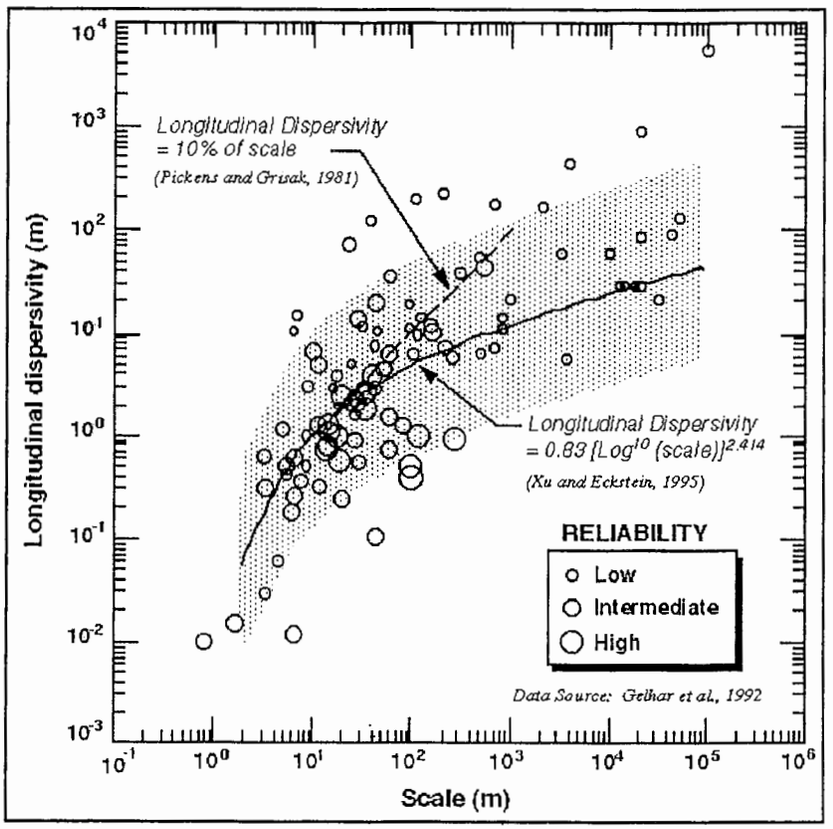


Figure A.1. Longitudinal dispersivity vs. scale data reported by Gelhar *et al.* (1992). Data includes Gelhar's reanalysis of several dispersivity studies. Size of circle represents general reliability of dispersivity estimates. Location of 10% of scale linear relationship plotted as dashed line (Pickens and Grisak, 1981). Xu and Eckstein's regression (used in BIOSCREEN) shown as solid line. Shaded area defines ± 1 order of magnitude from the Xu and Eckstein regression line and represents general range of acceptable values for dispersivity estimates. Note that BIOSCREEN defines scale as Lp, the plume length or distance to measurement point in ft, and employs the Xu and Eckstein algorithm with a conversion factor (see page 15).

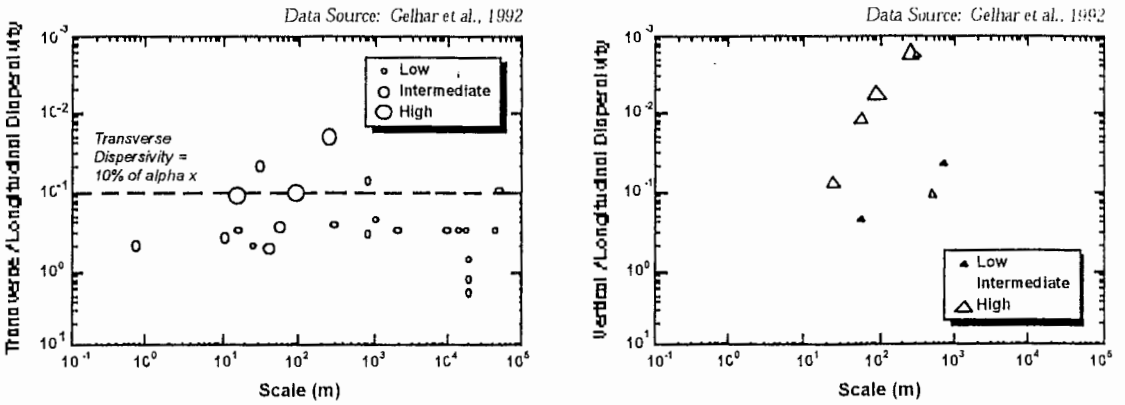

Figure A.2 Ratio of transverse dispersivity and vertical dispersivity to longitudinal dispersivity data vs. scale reported by Gelhar *et al.* (1992). Data includes Gelhar's reanalysis of several dispersivity studies. Size of symbol represents general reliability of dispersivity estimates. Location of transverse dispersivity relationship used in BIOSCREEN is plotted as dashed line.

APPENDIX K

RESPONSE TO COMMENTS

Response to Comments
from
United States Environmental Protection Agency (US EPA)

Draft Remedial Investigation (RI)
Fire Training and Demonstration Pad (SEAD-25) & Fire Training Pit and Area (SEAD-26)
Seneca Army Depot Activity, Romulus, NY

Comments Dated March 26, 1998

This is regarding the above referenced document prepared by Parsons Engineering-Science (Parsons ES) for SEDA through the U.S. Army Corps of Engineers New York District and Huntsville Division. While most of the EPA's May 9, 1997 comments were agreed to, a number of agreed-to changes were either not made at all, or not addressed satisfactorily, in the revised report. These are discussed below.

SECTION 3.0

Comment on Parsons ES's Response 10: It is still inappropriate to construct the 736 foot contour line. There is no basis to determine how far beyond the control point the 736 contour line is extended. This line should be removed from areas where there is no control.

Response to 10: Agreed. The 736 foot contour line has been removed from areas where there is no control on Figure 3-6.

Comment on Parsons ES's Response 13: The original response indicated that the request for a hydrogeologic flow section was acknowledged. However, a review of the revised document does not indicate that a hydrogeologic flow section has been completed for either of the sites.

Response to 13: Acknowledged. The hydrogeologic flow section already exists in the text as Section 3.1.6.2 (Groundwater Flow Directions) for the Till/Weathered Shale Aquifer and the Competent Shale Aquifer.

Comment on Parsons ES's Response 22: A review of the text indicates that the text has not been changed as originally requested.

Response to 22: Agreed. The text on page 3-52 para. 2 has been revised to state that monitoring well MW26-1 is located to the east of the site.

Comment on Parsons ES's Response 27: A review of the referenced figure, Figure 3-20, indicates that the requested change has not been made.

Response to 27: Agreed. The 744 potentiometric contour line on Figure 3-20 has been changed to pass through monitoring well MW26-10.

Comment on Parsons ES's Response 32: The requested change has not been made as originally requested and indicated in the response.

Response to 32: Agreed. Figure 3-24 has been revised to match Figure 3-24.

SECTION 4.0

Comment on Parsons ES's Response 4: The TAGM value for 1,2-dichloroethene should be used for comparison purposes with 1,2-dichloroethene (trans), as previously requested, since trans and cis commonly are not reported separately and can co-elute.

Response to 4: Acknowledged. As stated in the original EPA Comment #4, there is a TAGM value for 1,2-dichloroethene(trans) of 300 ug/kg. However, studies indicate that cis-1,2-DCE is the primary breakdown product of TCE as a result of the biodegradation process. Parsons ES purposely did not use the referenced TAGM value because it has been shown that over 90% of the DCE produced through the reduction dechlorination process of TCE is cis-1,2-DCE. The TAGM value for 1,2-dichloroethene (trans) will be added to Table 4-7. However, a footnote will also be added stating that this is the TAGM for 1,2-dichloroethene (trans) and that the product reported in the table is most likely the concentration for cis-1,2-DCE.

The USEPA "Symposium on Natural Attenuation of Chlorinated Organics in Ground Water" (EPA/540/R-96/509) was the reference used for this response.

Comment on Parsons ES's Response 13: A review of the text indicates that the text has not been revised as originally requested and indicated in the response.

Response to 13: Disagree. The statement discussing the origin of the inorganics found in the groundwater from Sampling Round 1 was removed from the text on page 4-67, paragraph 1. For this round of comments, the statement has also been removed from the Sampling Round 2 discussion on page 4-67, paragraph 3.

Comment on Parsons ES's Response 14: The text has not been changed, and still indicates that the referenced sample, SW25-6, was not used as a background sample because the contaminants detected were not site-related contaminants. This is not true since the compounds detected were SVOCs and PAHs which are site-related contaminants of concern. The text should be revised as originally requested.

Response to 14: Agreed. The text on page 4-74, paragraph 1, has been revised to state: "Although SW25-6 was intended as the background location at SEAD-25, it was not used because it was found to be impacted by elevated levels of SVOCs, and PAHs, which were detected in the sediment sample at this location. The presence of these constituents are not associated with past site activities but with storm drain discharges."

Comment on Parsons ES's Response 21: Based on a review of the data it does not appear that the requested text has been added as originally requested and indicated in the response to the comment.

Response to 21: Agreed. In response to the initial EPA comment, TPH was added to the list of compounds impacting the site on page 4-85 in the first paragraph of Section 4.1.8. Two sentences were also added relating the soil gas results to the groundwater and soil results on page 4-86. For this round of EPA comments, additional text has been added to summarize the soil gas survey results on page 4-85.

SECTION 5.0

Significant changes were made to the text, which require the following comments.

GENERAL COMMENT: This modeling effort is based on very limited field data, using data from only a few wells collected at a single point in time to characterize plume fate and transport over a period of 20, 40 or 100 years. Consequently, the limitations on any conclusions drawn from these models must be more clearly stated.

Response to GENERAL COMMENT: A description of the model and model limitations are discussed in the literature in Appendix I. Limitations due to field data will be more clearly discussed in the text. The following paragraph has been added to the Discussion of Model on page 5-45: "BIOSCREEN incorporates a number of simplifying assumptions and was designed primarily as a screening tool. This model was selected to evaluate the effects of natural attenuation on BTEX in groundwater because of the lack of sufficient data to perform more complex modeling efforts. BIOSCREEN is not intended to be a substitute for detailed mathematical models or for

making a final selection of remedial action alternatives. Taking into account these limitations, the model results serve as an initial indicator of the potential for natural attenuation to meet the remedial action objectives established for SEAD-25."

Comment Page 5-45, p4: "Recalcitrant" is not the same as non-degrading. Chloride is not a "recalcitrant" solute.

Response: Agreed. This term has been removed from the text.

Comment on Table 5-6: The value used for f_{oc} appears to be low and consequently provides a low calculated value for the Retardation factor. Please provide the literature source and reason for choosing a low f_{oc}.

Response: The value of f_{oc} (0.0008) was selected based upon the range of values presented in the BIOSCREEN User's Manual and the till description from SEAD-25 soil boring logs. The till is classified as sand and silty clay till materials. A range of values between 0.0002 and 0.02 was presented in the BIOSCREEN User's Manual. The two sources have been added to the Data Source column in Table 5-6.

Comment Figure 5-1: What is the source of the width and concentration given for the source zones? The information provided in this figure does not match what is presented in the text or figures of actual field data.

Response: The source zone widths were determined by measuring the contours of the BTEX isopleths shown in Figure 4-3. The methodology is described in the BIOSCREEN User's Manual. For instance, the width of zone 3 in the model is 64 ft, which corresponds to the width of the 1000 ug/l isopleth.

The source zone concentrations are based on the geometric mean between BTEX concentration isopleth contours as shown in Figure 4-3. These concentrations were adjusted upward to the original source concentrations. Therefore, these numbers are higher than the actual field data concentrations shown in Figure 4-3. This methodology is also presented in the BIOSCREEN User's Manual.

The following footnotes were added to Table 5-6: "Because a decaying source was used, the source concentration on the input screen (representing concentrations 20 years ago) were adjusted so the source concentration on the centerline output screen (representing concentrations now) were equal to 3 mg/L." and

"The source zone widths were determined by measuring the contours of the BTEX isopleths shown in Figure 4-3. Refer to the BIOSCREEN User's Manual for methodology."

Comment on Page 5-46, Discussion of Model Results.

First Bullet: To state that the "instantaneous reaction model did not show a good correlation" is misleading, since in fact, the results show no correlation. Further explanation beyond a "probabl(e) overestimat(ion of) the source decay rate" is needed to explain the null result for the instantaneous model.

Response: Agreed. The Bullet has been changed to state that the instantaneous model results did not correlate to site data.

Second Bullet: This conclusion is not apparent from the text or figures. Figure 5-2 seems to indicate the opposite. The meaning of the statement "This is represented by the upper value shown in the input screen for source half-life of 100 years." is unclear.

Response: Agreed. The statement should read ..."decrease"... not "increase." The referenced statement has been removed from the text.

Third Bullet: It is somewhat circular to say that the model indicates a fairly good match with the estimated plume length since the site data was calibrated to fit the first order decay model.

Response: Acknowledged. The first order decay model was used as the primary model to try to model the plume. We also tried the instantaneous model to reproduce the plume length and concluded that the first order decay model was a better match.

Fourth Bullet: Please clarify. ("The model results are somewhat conservative estimates." - of what?)

Response: This statement has been expanded to: "The model results are somewhat conservative estimates of solute transport and solute decay rates in the plume.... The Koc value for benzene is lower than either toluene, ethylbenzene, or xylenes and would therefore overestimate the mobility of the other BTEX compounds since theoretically, they have a greater affinity for the organic carbon fraction of the soil. The decay rate or half-life for benzene is greater than the half-lives of the other BTEX compounds and therefore probably over estimates the time for the dissolved BTEX compounds to decay in the aquifer".

Fifth Bullet: What is the "actual solute transport" and why would it "lie somewhere between" the first-order reaction model and the instantaneous model since the site data was specifically calibrated to the first-order model, and the instantaneous model gave a null result for reasons that are unknown or were not adequately explained. The results do not appear to support this conclusion.

Response: Agreed. The actual solute transport is best represented by the first order decay model as stated in the third bullet, although this model is likely to be conservative because the model does not account for biodegradation of the source. This statement has been revised to the following: " The first-order decay model results are likely to be conservative because the model does not account for decay of the source material and likely biodegradation of the source."

Comment on Page 5-51, para 1: The source for the numbers used, and the reason for their use in this paragraph is unclear. It appears that circular reasoning is being used, since the only mass accurately known is the current mass.

Response: Acknowledged. The paragraph describes the calibration process. The original source mass, shown as 14 kg, was adjusted so that the mass in the source closely matched that observed by the most current sampling data. The following sentence has been added to the beginning of the paragraph to clarify that this is a discussion of the calibration process: "As part of the calibration process, we looked at matching the plume length and mass in the source area with the field data."

Comment on Section 5.4.3 Groundwater Contaminant Transport at SEAD-26: The goals for this modeling effort seem particularly ambitious considering that there is only one field data point with detected VOCs (MW-7) to calibrate the results. The Army could re-evaluate the need to conduct modeling at this SEAD.

Response: Agreed. The results of the model are a very preliminary approximation of the effects of natural attenuation on the soluble mass of BTEX in groundwater. However, we feel that the model provides a basis for further discussion of the plume. We realize the limitations of the results as stated in the first sentence of the Discussion of the Model Results.

Comment on Page 5-62: The conclusions stated in this paragraph would seem to result from the initial assumptions and constraints on the model rather than on the characteristics of the site. For example, it is stated that "The 40- and 100-year simulations using the same input parameters indicates that the plume length shows the same decay characteristics [as the 20-year simulation] and that the solute concentrations continue to show non-detectable levels at the nearest

downgradient well." Would it be possible for the 40- and 100-year simulations using the same input parameters to show anything other than the same decay characteristics as the 20-year simulation? The conclusions should clearly state the limitations of the modeling results caused by the limited model input data.

In the final sentence, it is stated that the "first-order decay model does not take into account biodegradation of the soluble mass in soils." This appears to contradict the description of the model on page 5-45, which describes the second of the three model types as "2. Solute transport with biodegradation modeled as a first-order decay process."

Response: a) Agreed. The limitations of the modeling results due to the lack of site specific data were stated in the first sentence of the Discussion of Model Results.

b) The first order decay model assumes biodegradation of the dissolved constituents in the plume and not the soluble mass in the soils (source area). For the first-order decay model, the solute degradation rate is proportional to the solute concentration. Therefore, theoretically, as the solute concentration decreases over time (assuming a degrading or finite source term), the degradation rate should decrease over time. The following phrase has been added to the final sentence: "Although the first-order decay model assumes biodegradation of the dissolved constituents in the plume, ...".

SECTION 6.0 and SECTION 7.0

Comment on Parsons ES's Response # 2c: No such appendix was located in the revised Remedial Investigation Report.

Response to #2c: Agree. Appendix L will be added with toxicity profiles.

Comment on Parsons ES's Response #4e: This discussion should be included in the text.

Response to #4e: Agree. New text will be added.

Comment on Parsons ES's Response #9: This discussion should be included in the text.

Response to #9 : Agree. New text will be added.

Comment on Parsons ES's Response #11: The text and tables have not been consistently revised to correct the distinction between a 95% UCL concentration (or a 95% confidence interval) and a 95th percentile exposure parameter. See, for example, the text on Page 6-12 and Table 6.3.

Response to #11 : Agree. The document will be reviewed to make requested corrections.

Comment on Parsons ES's Response #27: The reference or rationale for the "four times the detected value" criteria presented on Page 6-42, 4th Paragraph, third and fourth bullets should be provided. The algorithms are not provided as indicated on Page 6-42, 5th Paragraph. In Table 6.3, Page 4 the data in the "No. of Rejected SQLs" and "No. of Hits" columns appear reversed. Table 6.3 should be checked and corrected as appropriate.

Response to #27 : Agree. A paragraph will be added that discusses the rationale for the "four times the detected value" criteria. The word "algorithm" on page 6-42 will be changed to "series of steps" to remove confusion. The column headings in Table 6-3 are correct as presented.

Comment on Parsons ES's Response #31: This discussion should be included in the text.

Response to #31 : Agree. New text will be added.

Comment on Parsons ES's Response #33: The text on Page 6-60 has not been revised.

Response to #33 : Agree. Text will be revised as requested.

Comment on Parsons ES's Responses #40 through #44 were not provided so the appropriateness of the responses could not be evaluated.

Response to #40 through #44 : Agree. Responses #40 through #44 were faxed to the USEPA on April 15, 1998. These responses were approved verbally by the USEPA on May 13, 1998. No further changes are required.

Comment on Parsons ES's Response #47: On Page 6-70, the term "exposure interval" is correctly defined as ET x EF x ED, yet the exposure intervals for the resident child and adult (Table 6-5) are based on 365 days/year (versus the assumed 350 days/year exposure) and the exposure interval for the site worker (Table 6-6) is based on 24 hours/day, 365 days/year, 25 years (versus the assumed 8 hours/day, 20 days/year, 25 years exposure). Either the "Exposure Interval" column or the note can be deleted in Table 6-5 and 6-6; they provide redundant and, at the moment, incorrect information. Since the exposure point concentrations in air are dependent on

the exposure interval, separate exposure point concentrations in air should be calculated and presented for both the RME and CT parameters for the site worker, resident child and adult, and construction worker.

Response to #47 : Agree. Tables 6-5 and 6-6 will be revised to include calculations of emission rates and air concentrations for each exposure duration corresponding to the RME and CT cases for the resident adult and child, and the site worker (6 different cases and calculations in all). The text will also be modified to reflect this change. The exposure interval, t, used in the model described on page 6-70 should not be defined as ET x EF x ED, and the text will be revised accordingly. Rather, t is the duration of emissions which corresponds with the exposure duration of concern for risk assessment. This distinction is important because passive volatile emissions from the soil surface continue to occur in the absence of an exposed receptor. Therefore, t is correctly defined as the exposure duration of concern, expressed in seconds.

Comment on Parsons ES's Response #51: The body surfaces corresponding to the assumed surface areas for the site worker and construction worker should be provided.

Response to #51: Agree. The body surfaces corresponding to the surface areas used in the exposure assessments will be identified in the text.

Comment on Parsons ES's Response # 52: The risk assessment now evaluates the potential for noncarcinogenic health effects for a resident child and a resident adult separately, as appropriate. However, potential carcinogenic risks for a resident adult are still evaluated incorrectly. Such risks should be evaluated based on 6 years at the child's exposure rate and 24 years at the adult's exposure rate, for a total exposure of 30 years prorated over a 70-year lifetime. In Table 6-26 for instance, Adult Intake (Car) is based on the adult exposure rate for 30 years. The "Averaging Time" for Adult (Nc) of 10, 950 days is correct, although it should not be computed as "6 x 365 Child 24 x 365 Adult" as indicated in the notes to the table.

Response to #52: Agree. Carcinogenic risks will be re-calculated based on 6 years of exposure for a child and 24 years of exposure for an adult. In each case, adult and child intakes will be weighted as recommended in RAGS Part B, Section 3.1.2.

Comment on Parsons ES's Response #54: The exposure parameters for both the RME and CT analyses are still not provided consistently. On Page 6-117 for instance, the water ingestion rates for the resident child are not provided.

Response to #54: Agree. The requested exposure parameters will be added to the text.

Comment on Parsons ES's Response #55: The USEPA qualification on the dermal exposure methodology has not been provided; the discussion on pages 5-51 and 5-52 of the USEPA' Dermal Exposure Assessment: Principles and Applications should be consulted. The equations for Absorbed Dose and Absorbed Dose per Event have not been corrected for the CW and CF terms.

Response to #55: Agree. The USEPA qualification on the dermal exposure methodology will be added to the text and the equations will be corrected.

Comment on Parsons ES's Response #56: It is not clear from the text or the corresponding tables how EPC-Cderm was calculated. In the note on Table 6-38 reference is incorrectly made to Table 6-29. The text should be reviewed for consistency and corrected. For instance, on Page 6-125 it is incorrectly stated that "The same groundwater concentrations that were used in the two previous exposure scenarios were used in this scenario."

Response to #56: Agree. The calculation of EPC-Cderm will be explained in the text and in Tables 6-38 and 6-39. The cross-reference in the footnote will be corrected to Tables 6-40 and 6-41.

Comment on Parsons ES's Response #59: Tables 6-40 and 6-41 still report EPC-Groundwater in mg/l while the model uses concentration in the shower water in ug/l. It is not clear why the "Efficiency of Release" equals 0.00 for a number of chemicals in Tables 6-40 and 6-41. Model input and output should be reviewed and corrected.

Response to #59: Agree. The tables will be corrected. The equations in the tables and text will be revised to be consistent with an EPC expressed in mg/l.

Comment on Parsons ES's Response #60: The inhalation rate for the child should be presented and referenced.

Response to #60: Agree.

Comment on Parsons ES's Response #64: The equations have not been corrected to include CF.

Response to #64: Agree. The equations for DA will be revised to include the conversion factor (CF).

Comment on Parsons ES's Response #65: The text has not been corrected. On Page 6-121, "Table 5-18" should be corrected to "Table 5-8".

Response to #65: Agree. The corrections will be made.

Comment on Parsons ES's Response #66: The USEPA permeability coefficient for water of 1E-03 was not used. The calculations presented in Table 6-45 should be corrected. Use of the permeability coefficient for water as a default for metals without specific permeability coefficients should be indicated on Page 6-132.

Response to #66: Agree. The default permeability coefficient will be used and the appropriate tables corrected.

Comment on Parsons ES's Response #69: The text on Page 6-145, 5th Paragraph has not been revised.

Response to #69: Agree. The paragraph will be revised to include provisional criteria provided by USEPA.

Comment on Parsons ES's Response #78:

a. The risk estimates have not been revised to present only one significant figure. See, for example, Table 6-51.

Response to #78 a.: Agree. All risk tables will be revised to express all risk estimates to one significant figure.

b. A consistent presentation of scientific notation is not provided. See, for example, the text on Page 6-158 (where the 4.7×10^{-10} convention is used) and Table 6-51 (where the 4.7E-10 convention is used).

Response to #78 b.: Agree. The text will be amended to discuss the different notations used including an explanation of why the tables use a different form from the text.

d. The text and tables are still misleading. The statements on Page 6-158 that the inhalation pathway (2nd Paragraph) and the dermal exposure pathway (4th Paragraph) ". . . adds no additional risk . . ." is not true. Due to the lack of toxicological criteria, risks from inhalation exposure were not quantified. Due to the lack of chemical-specific dermal

absorption factors, dermal exposure and the risk from dermal exposure were not just quantified. The USEPA's current carcinogen assessment methodology is such that any exposure results in some incremental cancer risk. The 0E+00 entries for Total HQ and Total CR should be deleted from Tables 6-53, 6-54, 6-57 and 6-58. The 0E+00 entries for child hazard index, adult hazard index, and cancer risk should be deleted from Table 6-88.

Response to #78 d.: Agree. Risk tables showing no quantified risks will be deleted. The summary tables will show risks from these pathways as "not quantified" with an explanatory footnote.

g. With the exception of lead, no toxicological information is provided for the other chemicals of concern without toxicity criteria. The list of chemicals on Page 6-206 needs revision.

Response to #78 g.: Agree. The list on page 6-206 will be revised. Toxicological profiles will be provided for significant compounds in an appendix.

Comment on Parsons ES's Response #90: The text on Page 6-205, 3rd Paragraph should be corrected.

Response to #90: Agree.

Comment on Parsons ES's Response #91: The 400 mg/kg revised interim soil lead guidance value is not a "clean-up goal"; the USEPA directive should be consulted. Also on Page 6-206, 2nd Paragraph, comparison of surface water and sediment data to NYSDEC ambient water quality criteria and sediment criteria based on the protection of aquatic biota is inappropriate for the evaluation of potential human health risks.

Response to #91: Agree. The phrase "clean-up goal" will be replaced with "residential screening level". The references to aquatic criteria for sediment and NYSDEC ambient water quality criteria will be removed.

Comment on Parsons ES's Response #92: The USEPA guidance should be consulted and the text revised accordingly. The statement that ". . . using oral absorption to estimate dermal absorption . . ." indicates a misunderstanding of how dermal exposure is quantified and how toxicity criteria based on oral exposure are adjusted for use in assessing dermal exposure. There is no such term "oral dermal adjustment factors" and no basis for describing them as "conservative". Where available, chemical-specific oral absorption factors reported in the scientific literature were

used to adjust toxicity criteria based on "delivered dose" to "absorbed dose"; in the absence of chemical-specific factors, a non-conservative default factor of 1 was used.

Response to #92: Agree. The discussion of the adjustment of oral toxicity factors for use in dermal assessment will be revised.

Additional comment: It appears that text should continue past page 7-305, but the document sent to EPA does not include this.

Response to Additional comment: Agree. The final pages of Section 7 will be included in the new text.

New York Department of Environmental Conservation
on
Draft Remedial Investigation (RI)
Fire Training and Demonstration Pad (SEAD-25) & Fire Training Pit and Area (SEAD-26)
Seneca Army Depot Activity, Romulus, NY
Comments Dated February 9, 1998

Figure 1-9 - General Soil Map: Due to the quality of the reproduction, this figure is nearly illegible.

Response: Agreed. Figure 1-9, the soil map, has been reproduced to be more legible.

Figure 1-10 - Surficial Soil Map: Due to the quality of the reproduction, this figure is nearly illegible.

Response: Agreed. Figures 1-10 and 1-11, the surficial soil maps, have been reproduced to be more legible.

Section 1.5.4 - Hydrogeology at SEDA: The statement on page 1-36 that data demonstrates a higher amount of precipitation in the spring and relatively lower amounts in the summer is contradicted numerous times throughout the remainder of the text. The following Table 1-3, Figure 1-14, Section 3.1.3, etc..., describe June as the month (and summer as the season) with the highest amounts of precipitation. The discussion in Section 1.5.4 should be changed as necessary.

Response: Agreed. The text has been revised on pages 1-35 and 1-36. The reference to decreasing precipitation in the summer has been removed from the last paragraph on page 1-35. On page 1-36, paragraph 1, the text now states that increasing precipitation occurs in the late summer and early fall (August and September).

Section 1.5.5 - Regional Topography: Is it correct that the Depot's land surface generally slopes upwards to the North? Figure 1-6 seems to indicate that the land slopes upwards to the South.

Response: Agreed. the text has been revised on page 1-36 (Section 1.5.5) to state that the land slopes upwards to the South.

Section 2.3.7.4 - Groundwater Sampling: The discussion here needs to be updated. Future tense is used when discussing the second round of sampling.

Response: Agreed. The discussion in Section 2.3.7.4 (page 2-52) has been revised and the future tenses removed.

Section 2.3.8 - Aquifer Testing: The discussion here needs to be updated. Future tense is used throughout the discussion.

Response: Agreed. The disucssion in Section 2.3.8 (page 2-52) has been revised and the future tenses removed.

Figure 4-2 - SEAD-25 Distribution of BTEX in Soils: The data presented needs units of measure.

Response: Agreed. The units have been added to the legend on Figure 4-2.

Figure 4-8 - SEAD-26 Total TICs in Surface Soils: The title of this figure should indicate with what analytical parameter these TICs are associated (i.e., SVOCs).

Response: Agreed. The title of Figure 4-8 has been revised to SVOC TICs.

Figure 4-12 - SEAD-26 Distribution of TICs in Soil: This figure does not appear to include the data from Figure 4-8 (SEAD-26 Total of All [SVOC] TICs in Surface Soils). The complete data set should be included, or the title of the figure should qualify the information presented. Likewise, Figures 4-10, 4-11, and 4-13 should include surface soil data or the title should qualify the information presented.

Response: Agreed. Figure 4-12 only presents TICs in the subsurface soils and therefore does not include the data from Figure 4-8, which presents surface soil data. The title of Figure 4-12 has been revised to SVOC TICs in Subsurface Soils. Page 4-139, paragraph 2, has been revised to discuss "subsurface" soils. The figures referenced in this paragraph show subsurface soil PAHs (Figure 4-10), TCL SVOCs (Figure 4-11), SVOC TICs (Figure 4-12), and total SVOCs (Figure 4-13). The title of these figures have also been revised to Subsurface Soils.

Comments for
Draft RI for the Fire Training Areas
by The United States Environmental Protection Agency (USEPA)

Draft RI for the Fire Training Areas

Section 6.0 and 7.0

Comment #1 Because of the volume of comments on 6.0 and the similarity of Sections 6.0 and 7.0, the review of Section 7.0 was cursory; only the site-specific data usage was reviewed in detail. Since the format and methodologies appear consistent between Section 6.0 and 7.0, the specific comments on Section 6.0 generally apply to Section 7.0 and should be corrected as noted in the following comments.

Response #1 Agreed. Both Sections 6.0 and 7.0 have been revised in accordance with this set of comments.

Comment #2 **General Comment:** The overall approach and content of the Baseline Risk Assessment was compared to that outlined in the Draft Final Generic Remedial Investigation/Feasibility (RI/FS) Work Plan. To conform to the Work Plan, the following items should be included in the Baseline Risk Assessment:

a) Evaluation of the potential for inhalation of contaminated respirable particulates by construction workers during intrusive soil activities.

b) Separate assessments of the potential for adverse, noncarcinogenic health effects in resident children.

c) "Summary toxicity profiles which summarize pertinent information regarding the chemicals".

d) "Comparison of exposure concentrations to ARARs" in the Risk Characterization.

Response #2

a) Agreed. This exposure pathway has been included.

b) Agreed. The Hazard Index for noncancer health effects has been calculated and presented for a future residential child. The Hazard Index has been based upon a 30-year exposure (includes both child and adult exposure periods).

c) Agreed. Toxicity profiles will be provided in an Appendix to the risk assessment for chemicals that contribute significantly to risk.

d) Disagree. ARARs are appropriately compared with all site chemical measurements in Section 4. Comparison with EPCs in Section 6 is therefore redundant, and unnecessary. In light of this, the ARAR comparison has not been repeated in Section 6.

Comment #3

Page 6-3, P1: While not incorrect, on-site surface soil is defined here, and throughout Section 6.0 and Section 7.0 as soil collected from the "0 to 0.5 foot range" or from "0 to 6 inches below grade". However, the Soil Investigation described in Section 2.2.5 indicates that samples "0 to 2 inches below grade for the RI program" or "from 0 to 2 inches below the organic matter" were collected from soil borings at SEAD-25 and SEAD-26 and that "grab samples of surface soils... from 0 to 2 inches below ground surface" were collected at SEAD-26. The text should be revised to better, and more accurately, describe the surface soil and surface/subsurface soil data sets.

Response #3

Disagree. The definition of surface soil as 0 to 6 inches accurately describes the treatment of soil sample data for the risk assessment. Details of the exact depth of each sample can be obtained in earlier sections of this RI.

Comment #4

Page 6-3, P1: The text should be revised to include more complete descriptions of the samples included in each data set. Specifically:

a) Based on the number of surface soil and soil analyses reported in Table 6-3, it appears that data from samples collected to characterize background (i.e., SEAD25-6 and SEAD25-7) were included in the soil data sets.

b) Information should be provided to account for the 44 groundwater analyses reported in Table 6-3. Based on Section 2.3.7.4 Groundwater Sampling, three monitoring wells were sampled during the ESI and 19 monitoring wells were sampled during the Phase I RI The rationale for combining data from monitoring wells screened in the till/weathered shale and the competent shale should be provided. It also appears that data from samples collected to characterize background (i.e., MW25-1, MW25-6, and MW25-7D) were included in the groundwater data set.

c) Based on the number of surface water samples reported in Table 6.3, it appears that a duplicate analysis was included as a separate analysis and that samples collected to characterize background were included in the data set.

d) Based on the number of sediment samples reported in Table 6.3, it appears that two duplicate analyses were included as separate analyses and that samples collected to characterize background were included in the data set.

e) Since the baseline risk assessment is intended to characterize risks associated with contaminant at or migrating from SEAD-25, surface water and sediment data from upstream locations should be used to distinguish site-related contamination and contamination that could have originated from off-site sources and to select site-related chemicals of potential concern.

f) A rationale should be provided for the inclusion of data from samples collected to characterize background in the data sets.

Response #4

a) Agreed. Background data have been removed from data sets used to determine EPCs for the risk assessment.

b) Agreed. A cross-reference to Section 2 has been inserted for details on the sample sets. The following sentence has been added: "Data from the deep (i.e. bedrock) groundwater wells were included with the shallow well data for the risk assessment, since the bedrock wells are no deeper than 15-20 feet from the surface and potentially would be accessible if a drinking water supply well were developed in the future." Background data have been removed from data sets used to determine EPCs for the risk assessment.

c). Agreed. Background data have been removed from data sets used to determine EPCs for the risk assessment. Results of duplicate analyses have been averaged to yield results for a single sample.

d). Agreed. Background data have been removed from data sets used to determine EPCs for the risk assessment. Results of duplicate analyses have been averaged to yield results for a single sample that has been included in the estimate of the EPC.

e) Disagree. Background for drainage ditches throughout SEDA has not been defined. Therefore, to be conservative, all samples found in the drainage ditches have been considered in this risk assessment. It should be noted that the upstream surface water and sediment data for SEAD 25 show similar compounds and concentrations to that at the site. Runoff from non-point sources (e.g.; roadways) are the likely source of conditions in the drainage ditches surrounding SEAD 25.

f) Agreed. Background data have been removed from data sets used to determine EPCs for the risk assessment.

Comment #5

Page 6-5: Toxicity data should be presented in hierarchal order.

Response #5

Agreed.

Comment #6

Page 6-5, P4: " literature-derived calculations..." were not and should not be used in the human health evaluation. The text should be corrected.

Response #6 Agreed. "...literature-derived calculations..." has been replaced with "...EPA Risk Assessment Issue Papers...".

Comment #7 **Page 6-7, Sec. 6.2.1.1, P1:** "...four sites.... " in the last sentence should be corrected as the background data set includes data from "the SEAD-25 RI, 25 ESIs, the Ash Landfill, and the OB Grounds site."

Response #7 Agreed

Comment #8 **Page 6-9, P1:** While referred to as "replicates", these samples are referred to as "duplicates" in the remainder of Section 6.0. The terminology should be made consistent throughput.

Response #8 Agreed. The word "replicate" in this paragraph has been replaced with "duplicate".

Comment #9 **Page 6-9. Section 6.2.2:** The results of the split sample analyses are not mentioned in this subsection. A brief discussion of the comparability of the sample data to the split sample data should be presented.

Response #9 Disagree. The results of the split samples analyses have not been provided by the COE laboratory for inclusion in this assessment.

Comment #10 **Page 6-11, Sec. 6.2.2.3, P2:** As no prior mention is made in Section 6.0, some discussion of Phase I and II samples and results should be provided. The statement regarding "comparison to reference standards" and the term "reference standard" should be clarified. No such comparison is made in Section 6.0.

Response #10 Agreed. A cross-reference to Section 4 for a description of Phase I and Phase II samples has been inserted. The phrases "reference standards" and "reference concentrations" on page 6-11 has been replaced with: "State and Federal groundwater criteria (NYS Class GA and/or federal Maximum Concentration Limits)".

Comment #11 **Page 6-11, Sec. 6.2.2.3, P3:** There is difference between a 95% upper confidence limit and a 95th percentile value. The USEPA's Supplemental Guidance to RAGS: Calculating the Concentration Term (USEPA, 1992; Publication 9285.7-08I) should be consulted and the text and tables in Section 6.0 should be revised accordingly.

Response #11 Agreed. Page 6-11 has been corrected to use only the 95% upper confidence limit (UCL) of the mean.

Comment #12 **Page 6-11, Sec. 6.2.2.3, P3:** Clarification should be provided as to how non-detects are treated in each calculation involved with establishing the data sets and estimating the exposure point concentrations. It appears that in selecting chemicals of potential concern non-detects are set equal

to the SQLs, whereas in the derivation of exposure point concentrations non-detects are set equal to one-half of the SQLs.

Response #12 Disagree. Treatment of non-detects as one-half the SQL in calculation of EPCs for the risk assessment is discussed in the first paragraph on page 6-12. Compounds not detected in any sample for a media were eliminated from the risk assessment.

Comment #13 **Page 6-12, Sec. 6.2.2.4, P4:** The data qualifiers presented are typically used with organic chemical analyses. For completeness, data qualifiers used with the inorganic chemical analyses should also be provided.

Response #13 Disagree. The qualifiers shown on page 6-12 are applied consistently to both organic and inorganic data by the data validators. The 1st sentence of Section 6.2.2.4 has been revised to refer specifically to qualifiers applied by data validators (and not laboratories).

Comment #14 **Page 6-13, Sec. 6.2.2.5, P1:** Sample handling and sample transportation should be included in the list of possible sources of sample contamination.

Response #14 Agreed.

Comment #15 **Page 6-16, Sec. 6.2.3:** It appears from the numbers of analyses reported in Table 6-3 that duplicate samples were included in the data sets as separate analyses. Data from duplicate samples should not be treated as separate analyses; data from duplicate samples should be "composited" or averaged. The analyses should be revised accordingly.

Response #15 Agreed. Results of duplicate analyses have been averaged to yield results for a single sample. Table 6-3 and all affected subsequent tables have been revised.

Comment #16 **Page 6-26, P1:** The discussion of the WRS test should be revised to include (per Gilbert, 1987) that the two data sets need not be drawn from normal distributions and that the test can handle a moderate number of non-detected values by treating them as ties. The methodology for handling ties should also be briefly presented, assuming they were handled as described in Gilbert (1987).

Response #16 Agreed. The points regarding the type of distribution and ties have been added. The method for handling ties recommended by Gilbert (1987) was followed, and this method has been so referenced in the 2nd paragraph on page 6-26.

Comment #17 **Page 6-26:** The Wilcoxon Rank Sum Test (WRS Test) is employed to compare on-site soil and groundwater data sets to background soil and groundwater data sets. The statistical method is generally appropriate, however the small sample size comprises its results.

Response #17 Agreed. The WRS Test is consistent with recent EPA guidance. The soil background database is comprised of approximately 60 data points. The groundwater database is comprised of approximately 34 data points. This should not compromise the results.

Comment #18 **Page 6-27, P1:** The text should be revised to indicate that the "four analytes" are in groundwater.

Response #18 Agreed.

Comment #19 **Page 6-27, P2:** The text should be revised to indicate that the four inorganic analytes (arsenic, cadmium, selenium, and thallium), not "five", "were shown to occur in the SEAD-25 groundwater data set...".

Response #19 Agreed.

Comment #20 **Page 6-27:** By convention, confidence limits are set at 95%, rather than 97.5%.

Response #20 Agreed. The text will cite only the 95% confidence level.

Comment #21 **Figures 6-2 to 6-9:** The figures should be revised to include the concentration units.

Response #21 Agreed.

Comment #22 **Page 6-37, P1:** It is not clear, at this point in the text, what "...among the largest r measurements" means; only later in the text is this term described. The text should be revised accordingly.

Response #22 Agreed. The text has been revised to first define "r".

Comment #23 **Page 6-37, P2:** "Under normal conditions,..." should be rephrased to avoid confusion with "mormal distribution". It does not seem that "low detection levels" would necessitate the use of "... non-detect values..." in conducting the Quantile test. The text should be revised accordingly.

Response #23 Agreed. "Under normal conditions,..." has been changed to "Typically,...". The phrase "low detection levels and" has been deleted.

Comment #24 **Page 6-37:** Typo noted: alpha should be .05, not .5.

Response #24 Agreed. Alpha value has been changed from 0.5 to 0.05 in three instances.

Comment #25 **Page 6-39, Sec. 6.2.4:** USEPA Region II guidance for conducting exposure assessments is to select 90th - 95th percentile exposure parameters for the RME analyses and 50th percentile exposure parameters for the CT analyses, but not vary the exposure point

concentrations in the two analyses. The CT analyses should be revised accordingly.

Response #25 Agreed. All CT analyses and tables have been revised to incorporate the same EPC used in the RME analyses.

Comment #26 **Page 6-39, Sec. 6.2.4, P2:** The reference "(from Gilbert, 1997)" should be corrected to read "(from Gilbert, 1987)".

Response #26 Agreed. Date has been changed to 1987.

Comment #27 **Page 6-39, Sec. 6.2.4, P3:** In deriving exposure point concentrations, The underlying distribution of the data for each chemical of potential concern in each data set should be determined statistically and the appropriate equation should be used to calculate the 95% UCL concentration. The USEPA's Supplemental Guidance to RAGS, Calculating the Concentration Term, indicates that it is the USEPA's experience that most large environmental contaminant data sets from soil sampling are lognormally distributed rather than normally distributed and that in most cases it is reasonable to assume that soil sampling data are lognormally distributed. In cases where there is a question about the distribution of the data set, they recommend that a statistical test should be used to identify the best distributional assumption for the data set. The USEPA guidance should be consulted and the analyses should be revised accordingly. Gilbert (1987) should be consulted for the appropriate statistical tests. No basis (e.g., USEPA guidance, statistical validity, etc.) is provided for the use of the "Three RME and CT selection guidelines" or for the statement that these guidelines "... assure the use of conservative (i.e., health-protective) exposure point values...".

Response #27 Agreed. The text has been revised to describe a different method to calculate exposure point concentrations (EPCs) in keeping with USEPA's "Calculating the Concentration Term Guidance". Appropriate statistical tests (i.e., Shapiro-Wilk) have been performed for each chemical in each media-specific data set. These tests have been used to determine if the data distribution is either normal or lognormal. If the data appear to be normally distributed based on these tests, then the 95% UCL of the normal mean has been selected as the EPC. Otherwise, the 95% UCL of the mean based on a lognormal distribution has been calculated (with the H-statistic) and used as the EPC. Frequency of detection is no longer used is a basis to select the EPC.

Comment #28 **Table 6.3:** Aroclor 1232 is incorrectly listed in the table. The table should be revised to list Aroclor 1242. The subheading for "Metals" should be corrected.

Response #28 Agreed.

Comment #29 **Table 6.3:** Maximum values are used as the exposure point concentration. This practice is inappropriate when the 95% UCL is lower than the maximum recorded value, as is the case in this data set.

Response #29 Agreed. Maximum values will no longer be selected as EPCs. See response to Comment #27.

Comment #30 **Page 6-56, Sec. 6.3.3.1:** Consideration should be given to evaluating exposure of site maintenance workers to contaminants on respirable particulates made airborne during the "regular mowing of the area" indicated on Page 6-54.

Response #30 Agreed. Exposure of Site Maintenance Workers to contaminants on respirable particulates has been calculated and assessed.

Comment #31 **Page 6-56, Sec. 6.3.3.2:** Acknowledgement should be made of the potential for off-site populations to be exposed to contaminants in groundwater in the future.

Response #31 Disagree. Groundwater is migrating toward the southwest, away from the nearest site boundary. Current plume information, and the long distance to the southwest boundary of the site (over 2 miles away) indicate that offsite migration of contaminants is highly unlikely.

Comment #32 **Page 6-57, P4:** The text should be revised to clarify the phrase "intended current land use scenario".

Response #32 Agreed. The phrase has been changed to "anticipated future land use".

Comment #33 **Page 6-58, top:** The term "ideal scenarios" is inappropriate and should be reworded.

Response #33 Agreed. The phrase "ideal scenarios" has been changed to "representative scenarios."

Comment #34 **Page 6-58, P1:** This text is redundant and somewhat inconsistent with earlier presentations. In general, redundant text should be eliminated so as to not burden the reader and to avoid inconsistencies in presentation.

Response #34 Agreed. The text on pages 6-50 and 6-58 has been revised to remove redundancy and inconsistency.

Comment #35 **Page 6-58, Sec. 6.3.4.2.1, P1:** The text regarding groundwater transport modeling should be revised to include reference to this analysis in the RI Report and to indicate that the results were used only in the discussion of fate and transport mechanisms.

Response #35 Agreed. The following text has been added to the paragraph in Section 6.3.4.2.1:

"Groundwater modeling is discussed in Section 5. It should be noted that modeling results were not used as the basis for this risk assessment. This risk assessment used only direct on-site measurements to estimate exposure concentrations".

Comment #36

Page 6-60, Sec. 6.3.4.5: Comments on the Integration of Exposure Pathways include:

a) Both surface and subsurface soil data should be used to evaluate exposure to soil in the future, residential land use scenario as construction, utility repairs, and yardwork could easily bring contaminants detected in deeper soil to the surface. About 75% of the samples were collected at depths of less than or equal to 4 feet and the deepest samples were collected at a depth of 8 feet (i.e., the approximate depth of a basement).

b) As mentioned previously, consideration should be given to evaluating exposure of site maintenance workers to contaminants on respirable particulates made airborne during the "regular mowing of the area".

c) Consideration should be given to eliminating surface water ingestion as a pathway of concern as such exposure, during wading activities, seems unlikely.

d) Consideration should also be given to evaluating the surface water and sediment pathways for an older child or adolescent rather than for the resident child/adult as it seems that these age groups might be more prone to wading acitivities.

e) For the construction worker, potential exposure to VOCs passively released to the ambient air from soil is not as relevant as VOC release during activities, like digging an excavation, that may enhance VOC release.

f) Construction workers also have the potential to be exposed to contaminants on respirable particulates made airborne during activities like diggin and excavation. Construction worker exposure to VOCs and contaminated respirable particulates during intrusive activities in the soil should be evaluated.

Response #36

a) Disagree. The current assessment includes the most plausible types of residential exposure to surface soil. The type of construction and utility repair activities mentioned in the comment which would penetrate subsurface soils would be performed by a construction worker, and are adequately represented by the construction worker scenario in this risk assessment.

b) Agreed. See response to Comment No. 29.

c) Agreed. The surface water ingestion pathway has been eliminated.

d) Disagree. The child and child/adult analysis covers the possible range of exposures. Noncancer risks for the child have been calculated and presented separately from the child/adult, as requested in an earlier comment. This should provide a reasonable and adequate assessment to protect future residents of all ages from exposures via this pathway.

e) Agreed. Potential VOC emissions and worker exposures during construction has been modeled and assessed.

f) Agreed. Potential particulate emissions and worker exposures during construction has been modeled and assessed.

Comment #37 **Page 6-62, P1:** The belief that biotic intake pathways, such as the ingestion of garden vegetables, ".. would represent a minor incremental increase in uptake..." is unsupported. The text should be revised accordingly.

Response #37 Agreed. The 1st paragraph on page 6-62 has been revised as follows:

Cattle are not presently nor are they anticipated to be raised on SEAD 25 land. Therefore, consideration of exposures from ingestion of beef at the site is not appropriate. Similarly, there are no fish in the intermittent surface water at the site. Therefore, ingestion of fish from SEAD 25 is not plausible. The soil at the Fire Demonstration Pad where chemicals were found is extremely gravelly and could not be used to grow vegetables. Therefore, ingestion of garden vegetables grown in this soil is not an exposure pathway of concern.

Comment #38 **Page 6-62, Sec. 6.3.4.6:** The text (here and throughout Section 6.0) should be revised to correct for the distinction between an exposure pathway (e.g., groundwater) and an exposure route (e.g., ingestion).

Response #38 Agreed.

Comment #39 **Page 6-63, Sec. 6.3.4.6.5, P1:** Metals should be added to the list of chemical types detected in soil. For the on-site construction worker, the phrase "will come into contact with" should be changed to "could come in contact with".

Response #39 Agreed.

Comment #40 **Page 6-65, P2:** The statement that "Short-term (i.e., subchronic) and acute exposures were not evaluated" is incorrect as the exposure

Response #45 Agreed. The text has been changed to explain the location of receptors and identify that the nearest receptor is conservatively located within the emission area.

Comment #46 **Page 6-69, Sec. 6.3.5.1.2, P1:** "Current off-site" use was not considered in this anlysis. The text or the analysis should be revised accordingly.

Response #46 Agreed. The phrase "off-site" has been removed from the first sentence of Section 6.3.5.1.2 on page 6-69.

Comment #47 **Page 6-69, Sec. 6.3.4.1.2, P2:** The text should be revised to:

- indicate that an inhalation rate of 20 m^3/day is appropriate for a construction worker since it corresponds to 2.5 m^3/hour over an 8-hour workday;
- indicate that 234 days is the EF for the construction worker in the CT analysis, and
- describe the 9-year ED and 5-year ED in the CT analysis.

Response #47 Agreed. Paragraph 2 on page 6-69 has been revised to clarify which values of EF and ED were used for each receptor, and to include the 2.5 m^3/hr inhalation rate for site workers and construction workers, based on an 8-hour work day.

Comment #48 **Table 6-5:** All parameters (e.g., H, K_d, K_{oc}) used to derive the ambient air concentrations should be provided so the reader can work through the calculations. One method of data presentation (e.g., scientific notation) should be selected and used consistently. The values for E_i/area appear incorrect; the calculations should be checked and the values revised accordingly.

Response #48 Agreed. Physical property data have been included in Table 5-2. A sentence has been added to this effect. Calculations and formatting have been checked and corrected.

Comment #49 **Table 6-7:** The text indicates that chemicals of potential concern without toxicological criteria were not carried through the quantitative risk assessment, yet such chemicals appear in this table and others throughout Section 6.0. The text or the tables should be revised accordingly.

Response #49 Agreed. Provisional toxicological criteria have been inserted for chemicals where appropriate. Remaining chemicals without criteria will be deleted from tables. Tables have been footnoted to indicate that some chemicals shown do not have toxicological criteria relevant to the exposure route.

Comment #50 **Tables 6-7 to 6-12:** The values for Intake (Nc) and Intake (Car) appear incorrect. The unit conversion and/or the calculations should be checked and the values revised accordingly.

Response #50 Agreed. The unit conversion error in Tables 6-7 to 6-12 has been corrected.

Comment #51 **Page 6-85, Sec. 6.3.5.3:** Much of the methodology for assessing dermal exposure to soil is discussed in the corresponding section for sediment that appears later in the text. The methodology should be fully described here, the first time it is presented. The text should be revised to consistently include all parameters for both the RME and CT analyses and descriptions of each parameter. Assigning chemicals without credible ABSs for exposure to soil and ABS of 0% is misleading. It should be stated that USEPA Region II recommends quantifying dermal exposure for cadmium, arsenic, PCBs, dioxinx/furans and pentachorophenol (others are under development) only since credible values are not available for the other chemicals of concern. The text and tables should be revised accordingly. Rather than assigning a value of 0% ABS, these chemicals should be evaluated qualitatively in the uncertainty section.

Response #51 Agreed. The dermal assessment methodology discussion has been moved to page 6-85 and later redundancy has been removed, with proper cross-referencing. Text regarding ABS values and Region 2 policy has been revised. Tables have been revised to include only the chemicals recommended by Region 2.

Comment #52 **Page 6-85:** When combining childhood and adult risk estimates a composite 30 year duration (i.e., 6 childhood and 24 adult) should be used rather than individual 6 year (childhood) and 30 year (adult) durations.

Response #52 Agreed. A 6-year child and 30-year total adult/child exposure have been assessed for each pathway.

Comment #53 **Page 6-93, Sec. 6.3.5.4.1:** The statement that "Antimony, arsenic, cadmium, selenium, and thallium were found to be above background" contradicts the text in Section 6.2.3. The text should be revised accordingly.

Response #53 Agreed. This text has been deleted.

Comment #54 **Page 6-93, Sec. 6.3.5.4.2, P2:** While the USEPA only recommends that 6-year and 24-year exposure rates be used in estimating soil exposure and the associated cancer risks for an adult residing at a site for 30 years, using this approach consistently throughout the exposure assessment is acceptable. The text should be revised to consistently include all

parameters for both the RME and CT analyses and descriptions of each parameter.

Response #54 Agreed.

Comment #55 **Page 6-96, Sec. 6.3.5.5.2:** Much of the methodology for assessing dermal exposure to water is discussed in the corresponding section for surface water that appears later in the text. The methodology should be fully described here, the first time it is presented. The text should be revised to include the qualifications on the use of this approach by the USEPA in their Dermal Exposure Assessment: Principles and Applications (USEPA, 1992, EPA/600/8-91/011B). CW and CF are not needed in the equation for absorbed dose and the supporting text. Both parameters should appear in the equation for DA and the supporting text. The units (e.g., hours/day, events/day, etc.) should be checked and revised accordingly so they properly cancel in each equation.

Response #55 Agreed. The complete dermal assessment methodology discussion has been moved to page 6-96 and later redundancy has been removed, with proper cross-referencing.

Comment #56 **Tables 6-27 and 6-28:** The values for absorbed dose/event appear incorrect; the calculations should be checked and the values revised accordingly. The units for absorbed dose/event should be revised to mg/cm^2-event. The Permeability Coefficient appears as K_p in the text; the text or table should be revised accordingly. The parameter "B" does not appear to have been used in the calculations and should be deleted.

Response #56 Agreed. All requested changes have been made to Tables 6-27 and 6-28. Calculation and unit conversion errors have been corrected in these Tables.

Comment #57 **Page 6-100, Sec. 6.3.5.6.1, P2:** The equation for C_{inf} should be revised to indicate that $[(E)(F_w)(Ct/1000)]$ is divided by F_a. The desription of F_w should be revised to include the CT value of 8 L/min.

Response #57 Agreed. The equation for C_{inf} and the description of F_w have been corrected as requested.

Comment #58 **Tables 6-27 - 6-30:** Dermal and inhalation pathways for water-borne contaminants are evaluated concurrently. Such an evaluation dictates the need to apportion the COCs between the water and vapor phases so as to avoid double counting.

Response #58 Agreed. Partitioning of chemicals between air and water has been calculated and the appropriate water concentrations have been used to calculate inhalation and dermal exposures without double counting. Tables 6-27 through 6-30 have been revised accordingly.

Comment #59 **Table 6-29 - 6-30:** The values for EPC-Air are incorrect since EPC-Groundwater was input in mg/L rather than the ug/L called for in the shower model. The columns for Efficiency of Release should be revised so that values do not appear as 0.00.

Response #59 Agreed. Tables 6-29 and 6-30 have been corrected as requested.

Comment #60 **Page 6-106, P1:** The USEPA guidance in RAGS' (USEPA, 1989, EPA/540/1-89/002) recommends 20 m^3/day (or 0.83 m^3/hour) as the average inhalation rate for adults. The analyses should be revised accordingly.

Response #60 Agreed. The 1st sentence on page 6-106 has been changed to cite an inhalation rate of 0.83 m3/hr and the calculations in Tables 6-31 and 6-32 have been changed accordingly.

Comment #61 **Page 6-106, Sec. 6.3.5.7.1:** The statement (here and throughout Sec. 6.3.5) that "...current concentrations are likely to be reduced over time" should be revised or eliminated since, in the absence of remedial action, concentrations might not be reduced until the source is depleted.

Response #61 Agreed. This statement has been deleted.

Comment #62 **Page 6-106, Sec. 6.3.5.7.2:** The text should be revised to include descriptions of the exposure parameters used in the analyses.

Response #62 This exposure pathway, ingestion of surface water, has been deleted as requested (see Comment #36).

Comment #63 **Page 6-107, Sec. 6.3.5.8.2, P1:** As mentioned previously, consideration should be given to eliminating surface water ingestion as a pathway of concern as such exposure, during wading activities, seems unlikely. "The quantitative assessment of this exposure pathway..." does not include current uses. The text should be revised accordingly. CF is not needed in the equation for absorbed dose and the supporting text. The text should be revised to include both the bases and descriptions of the exposure parameters used in the analyses.

Response #63 The recommended corrections have been made. "Current use" and "CF" have been deleted from the text and equation.

The exposure parameter values used are already described in this section on pages 6-111 and 6-114.

Comment #64 **Page 6-110:** There is no need to include the equation for DA_{event} twice; the text should be revised accordingly. The parameter "tau" does not appear in the equation for DA_{event} in the USEPA's Dermal Exposure Assessment: Principles and Applications. The reason for its inclusion here should be presented or the text, equation, nad analyses should be revised accordingly. Values of the parameter "B" and "tau" are from

Table 5-8 of the USEPA guidance; the text should be revised accordingly. CF should appear in the equations for DA and DA_{event} and the supporting text in order for the units to properly cancel.

Response #64 Agreed. The text on pages 6-110 and 6-111 has been revised as requested.

Comment #65 **Page 6-110, P3:** The text should be revised to read, "...if the exposure time per event (ET) is less than the breakthrough time..."

Response #65 Agreed. The word "than" has been inserted in the sentence.

Comment #66 **Page 6-114, P1:** The USEPA in their Dermal Exposure Assessment: Principles and Applications recommends using a K_p of 1E-03 as the default for water. The text and analyses should be revised accordingly.

Response #66 Agreed. Kp = 1E-03 has been used as the default value.

Comment #67 **Page 6-114, Sec. 6.3.5.9:** It is not clear what is meant by the phrases "...apparent lack of sediment, ..." and "The sediment points on and around SEAD-25 are seasonal...". The text should be revised accordingly.

Response #67 Agreed. This text has been deleted. This paragraph has been replaced with the following:

The ingestion of on-site sediment is limited to a future resident, since current land use precludes public contact with sediment. Ingestion of sediment is assumed to occur when the drainage ditches are dry, when the sediment could potentially be ingested by children in the same manner as soil. This pathway is assumed to have the same exposure frequency (EF) and exposure duration (ED) used for the surface water pathway, since ingestion of dry sediment is expected to be about as infrequent as wading in the wet drainage ditches.

Comment #68 **Page 6-115, Sec. 6.3.5.9.2:** The units for IR should be revised to read "(mg sediment/day)". The text should be revised to include descriptions of the exposure parameters used in the analyses.

Response #68 Agreed. Units for IR have been corrected to "mg sediment/day". The following paragraph has been added to Section 6.3.5.9.2:

The values for parameters EF, ED, BW, and AT for both the RME and CT are the same as those used for the surface water exposure pathway. The values used for the sediment ingestion rate (IR) are the same as the EPA default values for residential soil ingestion. For the RME, IR = 200 mg/day for the child and 100 mg/day for an adult. For the CT, IR = 100 mg/day for the child and 50 mg/day for an adult.

Comment #69 **Page 6-121, Sec. 6.4:** The toxicological criteria should be updated to reflect provisional criteria provided in the USEPA's Health Effects Assessment Summary Tables FY-1995 Annual (USEPA, 1995, EPA 540/R-95-036) and FY-1995 Supplement (USEPA, 1995, EPA/540/R-95/142). As discussed in the Draft Generic RI/FS Work Plan, the USEPA's Superfund Health Risk Technical Support Center should be contracted for provisional criteria for chemicals of concern without toxicological criteria in IRIS or HEAST. Table 6-41 (not Table 6-29 as indicated in P2) and all risk estimates should be revised accordingly.

Response #69 Agreed. Provisional criteria have been obtained from the Superfund Technical Support Center. These and the 1995 HEAST Tables have been reviewed to update Table 6-41 and all risk tables.

Comment #70 **Page 6-123, Sec. 6.4.1.2:** The USEPA's guidance in RAGS recommends multiplying, not dividing, oral RfDs by oral absorption efficiencies for use in characterizing risks from dermal exposure. The text and all risk estimates should be revised accordingly.

Response #70 Agreed. The oral to dermal RfD conversion error has been corrected in Table 6-41, and all related risk calculations have been corrected.

Comment #71 **Page 6-124:** There is no reason to assume 100% absorption for the metals not listed here. Besides Owen (1990), there are other readily available literature sources that should be consulted for oral absorption efficencies, including the ATSDR Toxicity Profiles and Carsons et al's Toxicology and Biological Monitoring of Metals in Humans (Carson, B.L., H.V. Ellis, III and J.L. McCann, 1986, Lewis Publishers, Inc.). The list and the appropriate analyses should be revised accordingly.

Response #71 Agreed. The ATSDR Toxicity Profiles have been reviewed and have been used to update the oral absorption factors. A more appropriate and conservative absorption factor than 1.0 has been assumed for compounds where direct absorption factors are not available.

Comment #72 **Pgae 124:** The discussion regarding the adjustment of oral toxicity factors for dermal exposure is incorrect. Assuming 100% oral absorption when adjusting a toxicity factor to account for the difference between administered and absorbed dose serves to underestimate risk rather than overestimate it. Consequently, many of the adjusted dermal RfDs and Slope Factors in Table 6-41 are calculated incorrectly. This error is most apparent for cadmium.

Response #72 Agreed. The paragraph in question on page 6-124 has been deleted and replaced with a description of more appropriate assumed absorption factors. Table 6-41 and all related risk calculations have been corrected.

Comment #73 **Page 6-124, Sec. 6.4.1.3:** The text should be revised to include a statement that chronic RfDs and RfCs were used to characterize risks associated with less than chronic exposures.

Response #73 Agreed. The following sentence has been added to the paragraph in Section 6.4.1.3: "For children and construction workers, chronic RfDs and RfCs were used to conservatively assess risks for shorter exposure periods."

Comment #74 Page 6-127, P1: It is unnecessarily conservative to assume that all chromium detected in site samples is the hexavalent species. Consideration should be given to characterizing chromium risks based on the toxicological criteria for trivalent chromium or to assuming that only a percentage of the total chromium is present as the hexavalent species. The USEPA regards all Aroclor mixtures as Group B probable human carcinogens. The text should be revised accordingly.

Response #74 Aroclor-1242 has been added to the list under Group B on page 6-127. Assuming that all chromium is hexavalent does not influence overall risks at this site.

Comment #75 Table 6-41: The toxicological criteria listed in the table should be checked against the most recent IRIS entries and the 1995 HEAST and revised accordingly. The table should be revised to include provisional criteria provided by the Superfund Health Risk Technical Support Center. A few apparent errors (e.g., the inhalation RfD listed for 1,4-dichlorobenzene is the RfC) were noted that should be corrected. As there are two oral RfDs for cadmium, one for water exposure and one for food exposure, both RfDs should be listed and used to characterize risks associated with exposure to the respective media. The values for Dermal RfD and Carc. Slope Dermal should be revised as indicated in other comments.

Response #75 Agreed. Table 6-41 has been revised to include the most recent and correct toxicological criteria, including the correct RfD for 1,4-dichlorobenzene.

Comment #76 Page 6-131, P2: Relative potencies of 0.01 and 0.001 are recommended for benzo[k]fluoranthene and chrysene, respectively, in the USEPA's Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons (USEPA, 1993, EPA/600/R-93/089). The text, the slope factors in Table 6-41, and all corresponding analyses should be revised accordingly.

Response #76 Agreed. The relative potencies for benzo(k)fluoranthene and chrysene have been changed as requested.

Comment #77 Page 6-131, Sec. 6.4.2.2: The USEPA's guidance RAGS recommends dividing, not multiplying, oral slope factors by oral absorption

efficiencies for use in characterizing risks from dermal exposure. The text and all risk estimates should be revised accordingly.

Response #77 Agreed. The text and risk estimates have been corrected as requested.

Comment #78 Page 6-132, Sec. 6.5: Comments on the Risk Characterization include:

a) Risk estimates should be corrected to one significant figure as more than one significant figure implies a precision that is not possible with the current risk assessment methodologies.

b) One convention for reporting risk estimates in scientific notation (i.e., 4E-04) should be used. The text or the tables should be revised accordingly. It might help the reader to indicate, for instance, that 4E-04 means either 0.0004 (as a hazard index) or 4 in 10,000 (as an estimated cancer risk).

c) If the hazard indices or estimated cancer risks are less than or within the USEPA's risk criteria, there is no need to single out which exposure pathways, exposure routes, or chemicals of potential concern are the predominant contributors to the risk estimates. Doing so only brings undo attention to results that are of little significance.

d) Stating that the risks from dermal exposure to soil or sediment are "zero" or 0.0E+00 is incorrect as absorbed dose was not quantified for most chemicals of potential concern. The text and the corresponding tables should be revised accordingly, if not eliminated altogether.

e) The presentation of RME and CT risks is inconsistent, as quite often the CT risks are not presented. Similarly, the presentation of medium-specific risks is inconsistent as not all medium-specific risks are presented.

f) Consistent terminology should be used throughout (e.g., USEPA-defined target range vs. USEPA target range).

g) The potential for adverse health effects should be addressed qualitatively for all chemicals of concern without at least one toxicological criterion (i.e., an oral RfD, RfC, oral slope factor, or inhalation unit risk). Such a risk characterization could be in the form of a brief toxicological profile and a brief discussion of the extent and magnitude of site-related contamination for each chemical.

Response #78

a) Agreed. All cancer and noncancer risk estimates have been presented to one significant figure in scientific notation.

b) Agreed. See response to part (a).

c) Agreed. Where appropriate, text discussing low risk exposures has been deleted.

d) Agreed. The tables and text have been corrected as requested.

e) Acknowledged. The revised text will be more consistent, with emphasis only on pathways, routes and chemicals which contribute significantly to potential risk.

f) Agreed. "USEPA target range" has been used throughout the risk characterization.

g) Disagree. The group of compounds with no toxicological criteria, after inclusion of provisional criteria, are already discussed in the Uncertainty section (Section 6.5.5.3).

Comment #79 Page 6-134, P3: A reference should be provided for the "National Contingency Plan".

Response #79 Agreed. The regulatory citation for the Code of Federal Regulations has been added.

Comment #80 Page 6-134, Sec. 6.5.1.3: Since concentrations of TICs are unsupported best-guesses, qualifiers such as "fairly low" and other concentration-related statements should be removed from the text.

Response #80 Agreed. All references to TIC concentrations have been deleted. Two sentences which specify numeric concentrations in soil boring and groundwater samples have been deleted in their entirety.

Comment #81 Page 6-150, P2: "Noncarcinogenic exposures for the Central Tendency scenario" were not "a full order of magnitude lower than the RME scenario". If that was the case, the CT hazard index would have to be 0.31. The text should be revised accordingly.

Response #81 Agreed. The "order of magnitude" language has been revised.

Comment #82 Page 6-166, P4: The chemical-specific hazard indices presented only account for about one-half the RME total hazard index. The text should be revised to include a more complete accounting, if possible.

Response #82 Agreed. All risk estimates will change following revisions of tables and calculations. An appropriate complete accounting of chemical-specific risks has been included in this section in the revised text.

Comment #83 Page 6-167, P1: The total RME pathway risk is 1.8E-06. The text should be revised accordingly.

Response #83 Acknowledged. Risk estimates and text have been changed since the calculations have been revised.

Comment #84 Page 6-167, P4: The total pathway risk presented is for the CT scenario, not the RME scenario. The text should be revised accordingly.

Response #84 Acknowledged. Risk estimates and text have been changed since the calculations have been revised.

Comment #85 Page 6-167, P5: The text should be revised to indicate that the CT risks were within the "USEPA target range".

Response #85 Acknowledged. Risk estimates and text have been changed since the calculations have been revised.

Comment #86 Tables 6-70 and 6-71: The tables were not included in the copy of the draft RI Report.

Response #86 Acknowledged. Tables have been included in the revised report.

Comment #87 Page 6-179, Sec. 6.5.4.2, P5: A total RME cancer risk below the USEPA target range should not be regarded as "elevated". The text should be revised accordingly.

Response #87 Acknowledged. Risk estimates and text have been changed since the calculations have been revised.

Comment #88 Page 6-182, Sec. 6.5.5.2: There is a certain "double-counting" when estimating exposure to VOCs in groundwater from both inhalation and dermal contact as VOCs released into the air should not be available for dermal contact. In the inhalation of ambient air analyses, use of maximum 1-hour average concentrations to assess long-term exposure is very conservative. The text should be revised to indicate these exposures may be overestimated.

Response #88 Agreed. Double-counting of VOCs in showering exposure routes has been corrected. The following sentence has been added to the 4th paragraph on page 6-182 after the 2nd sentence: "Use of maximum 1-hour average ambient air concentrations to assess long-term inhalation exposure is conservative (i.e., tends to overestimate risk)."

Comment #89 Page 6-182, Sec. 6.5.5.2, P4: It does not appear, based on the earlier text, that "several sources were checked" regarding soil absorption factors. It appears that only the USEPA's Dermal Exposure Assessment: Principles and applications was consulted. The text should be revised accordingly.

Response #89 The sentence in question has been deleted.

Comment #90 Page 6-183, P1: Site-specific exposure frequencies that reflect seasonal conditions could have been used in the CT analysis. The CT analysis should be used to examine the sensitivity of the risk estimates to such parameters.

Response #90 Acknowledged.

Comment #91 Page 6-184: The USEPA soil lead guidance cited is outdated. The USEPA's Revised Interim Soil Lead Guidance for CERCLA Sites and RCRA Corrective Action Facilities (USEPA, 1994, EPA/540/F-94/043) should be consulted and the text revised accordingly. The current screening level for lead in residential soils is 400 ppm.

Response #91 Agreed. The cleanup goal has been changed to 400 ppm and the EPA guidance document has been referenced.

Comment #92 Page 6-184, P3: The statement that "Oral toxicity values were used without adjustment to calculate risks from dermal exposure..." is incorrect. The statement that "...carcinogenic risks from dermal exposure to PAH's were summed separately from other compounds" is incorrect as no such analysis was presented. The text should be revised accordingly.

Response #92 Agreed. The 3rd paragraph on page 6-184, 2nd sentence has been revised to reflect new oral-dermal adjustment factors and/or assumptions included in the revised risk analysis. The last sentence of this paragraph has been deleted.

Comment #93 Page 6-185, Sec. 6.5.5.5: As conducted, EPCs were also varied in the CT analysis. The text should be revised accordingly.

Response #93 In the revised calculations, the same EPCs have been used for both the RME and CT analyses, as requested in EPA's earlier comment.

Comment #94 Appendix E: The curves generated by Aquetsolv should be provided in the appendix for review to check the portion of the data was used for the calculations.

Response #94 Agreed. The Aquetsolv curves have been included in Appendix E.

Comment #95 Appendix F: Curves should be presented for the data presented in this Appendix.

Response #95 Agreed. The vertical connection test curves have been included in Appendix F.

Comment #96 Appendix I (ODAST Model): This model should be referred to in the text if it is being used to support the analysis. The equations given in the

text do not correspond to the equations given in the appendix. The output graphs given in the appendix also seem to bear no relation to the information given in the text. The concentration input for BTEX at SEAD-25 given in the Appendix (3.04 mg/l) corresponds to Figure 4-3 but does not correspond to Table 5-6. (See also Model Output comment). As it stands, the information given in the appendix and the text is insufficient to determine if the model results are credible.

It is unclear what simplifications were made to the model for its application to SEAD-26. These should be more clearly stated.

The validity of the modeling effort for predicting the change in concentration with time is questionable since only one true data point is available for each site. For SEAD-25, the concentration versus time graph is generated from this single data point and an initial condition based on the results of a previous model run, and cannot be considered reliable. For SEAD-26 the prediction is based solely on an initial concentration in one well and cannot be considered reliable.

Response #96 Acknowledged. Please see Section 5.0 Response #34.

RCRA Programs Branch

Comment #1 In SEAD 25, justify the assumption that natural attenuation of benzene, ethylbenzene, and total xylenes will occur in about 40 years in soil of SEAD-25. How do you demonstrate that VOCs are not migrating to an appreciable extent from soil to groundwater?

The fugacity and groundwater modeling systems should be described in detail.

Response #1 Acknowledged. Please see Section 5.0 Response #34.

Comment #2 It is anticipated that the following ARARs will be applicable during the remedial activities.

- 40 CFR Part 261 - Identification and listing of hazardous waste;
- 40 CFR Part 262 - Standards Applicable to Generators of Hazardous Waste;
- 40 CFR Part 264 - Standards for Owners and Operators of Hazardous Waste Treatment, Storage, and Disposal Facilities; and
- 40 CFR Part 265 - Groundwater Monitoring
- 40 CFR Part 268 - Land Disposal Restrictions.

Response #2 Agreed. The Project Scoping Plan (July 1995) presents a preliminary list of ARARs and "to be considered" (TBC) in accordance with 40 CFR Part 300. The Feasibility Study (FS) presents a comprehensive list of chemical-specific, action-specific, and location-specific ARARs. The

above-mentioned ARARs are identified as action-specific ARARs that must be met as part of the remedial action objectives.

Comments for
Draft RI for the Fire Training Areas
by The New York State Department of Environmental Conservation (NYSDEC)
and the New York State Department of Health (NYSDOH)

Draft RI for the Fire Training Areas

Comment #1 The report is well over 1,000 pages long, not counting the appendices. We realize this report contains the results of the remedial investigation for two separate sites, but many sections are duplicated and repeated verbatim in the separate discussions of SEADs 25 and 26. Wherever possible the consultant should consolidate these common items in future documents in order to facilitate their timely review. The consultant should also consider that this document will ultimately be part of the public record for the Seneca Army Depot Activity and as such must be manageable with regards to review by the public.

Response #1 **Agreed**. Any suggestions to eliminate, consolidate or reduce the size of the document is appreciated. We recognize that this is a large volume of technical information, however, it does represent the environmental conditions at two (2) independent sites.

Comment #2 The RI report should include a remedial action objective for each of these two sites. Without an agreed remedial action objective, it is unclear what the feasibility study report will address.

Response #2 **Disagree**. Remedial action objectives are not part of the RI as the need for a remedial action has not been determined until the RI is complete. If site conditions indicate unacceptable risk then remedial action objectives will be developed to reduce site conditions to acceptable levels of risk. The objectives of the RI are to collect a sufficient quantity and quality of data to accurately represent and assess site conditions.

A remedial action objective was established in the Project Scoping Document for SEAD-25 and SEAD-26 (July 1996). Section 1.1, Purpose of Report, in the Draft RI, has been expanded slightly to incorporate text from the Project Scoping Plan describing the purpose and intent of the RI.

Comment #3 The document leaves the impression that there is no need for remedial actions at SEAD 25 and 26 from an ecological standpoint. Without going into detailed comment, which would be interminable, given the magnitude of the material presented, we basically disagree with your conclusion that the site presents minimal actual or potential threat to wildlife. We think the actual toxicity of these sites derived through experimentation is the only definitive method for assessing the ecological effects since the site has a host of VOCs, SVOCs, pesticides,

nitroaromatics, herbicides and metals present and there is no way of knowing how these compounds interact toxicologically.

The following areas with potential for or actual exposure to biota are in need of remediation. Additionally, some of these areas need to be remediated to prevent the migration of contamination to now uncompromised media.

a. SEAD-25; The Fire Training and Demonstration Pad

i. Perimeter drainage ditches to minimize biota exposure or migration to more valuable habitats.

ii. Site soils to eliminate source of groundwater contamination.

b. SEAD-26; The Fire Training Pit and Area

i. Site perimeter drainage's - to prevent migration to other habitats and eliminate exposure.

ii. Site soils to eliminate exposure and a source of groundwater contamination.

iii. Fire training pit to eliminate bird exposure to contaminated drinking water and soils. Minute quantities of PAHs (0.002 μg benzo(a)pyrene/egg, Eisler, 1987) are known to cause embryonic growth reduction and increased incidence of abnormal survivors. These quantities could easily be transported on bird feet or feathers to distant nests.

Response #3

Disagree. The ecological risk assessments performed for these SEADs followed EPA guidance and used current accepted ecological risk assessment methods. Furthermore, the approach followed in these ecological risk assessments was described in the Work Plan for these sites before the assessments were performed. Serious concerns regarding the assessment methods would have been appropriately raised and resolved during the review of the Work Plan. As to the findings of these assessments, the risks presented in this report were calculated objectively based upon the data collected at the site during the RI.

Please note that the ecological risks have been re-calculated based upon revised exposure point concentrations (EPCs), in consideration of EPA's comments on the handling of background data, duplicates, and concentration term statistics in the draft human health risk assessments. These new EPCs have resulted in a new set of ecological risk estimates which may have affected the overall conclusions. However, no change in overall methodology has been made, nor should it be, since the approach conforms to EPA CERCLA guidance.

Comment #4 Throughout this report there appear to be contradictions in the definitions of a "surface soil" sample. Section 4.1.4, for instance, defines surface soil as "soil that exists from 0 to 6 inches": However, Table 4-5 states that surface soil samples were taken from a depth of 0.17 feet (2.04 inches). A surface soil sample as defined in the Generic Installation Remedial Investigation/Feasibility Study Work Plan for the Seneca Army Depot Activity is one collected from a depth of 0 to 2 inches below any overlying organic matter. Please explain or correct these discrepancies.

Response #4 **Acknowledged.** The statement in Section 4.1.4 has been changed to 0-2 inches (0.17 feet).

Comment #5 Unlike previous reports from this consultant, the sampling data summary tables in this report lack a "maximum value detected" column. It has been our experience that this column is very helpful in the review of the sampling data. Please replace this column or explain its absence.

Response #5 **Disagree.** Maximum values for each compound by media are shown in the summary statistics tables.

Comment #6 Discussions of potential future land uses in this and future documents must address the proposal for future uses scheduled to be presented by the Local Redevelopment Authority (LRA) on October 8, 1996. The LRA's reuse plan will represent the first time concrete proposals for reuse of the base have been produced.

Response #6 **Acknowledged.** The future uses of the site as proposed by the LRA and by the Seneca Army Depot as presented in their Reuse Plan and Implementation Strategy (December 1996) will be considered during the process of evaluating and selecting the preferred remedial actions for SEAD-25 and SEAD-26.

Comment #7 The consultant should include a discussion justifying the use of only the surface soil sample results in the calculation of risk to current site workers and future on-site residents of these sites.

Response #7 **Agreed.** A paragraph explaining this aspect of the soil exposure pathways has been added.

Comment #8 The RI report has demonstrated that SEADs 25 and 26 are impacted by considerable levels of polycyclic aromatic hydrocarbons (PAHs). Of greatest concern are those PAHs which are considered carcinogenic. We would like to request that the consultant list separately the results for the individual and total carcinogenic PAHs in the soil and sediment sample summary tables. Furthermore, Figures 4-5, 4-6; and 4-14 should include the total carcinogenic PAH levels for the samples. The following is a list of PAHs considered to be carcinogenic:

benz(a)anthracene	chrysene	dibenz(a,e)pyrene
benzo(b)fluoranthene	dibenz(a,h)acridine	dibenzo(a,h)pyrene
benzo(j)fluoranthene	dibenz(a,j)acridine	dibenzo(a,i)pyrene
benzo(k)fluoranthene	dibenz(a,h)anthracene	dibenzo(a,l)pyrene
benzo(a)pyrene	dibenz(c,g)carbozole	ideno(1,2,3-cd)pyrene
		5-methylchrysene

Response #8 **Disagree.** Where an exposure scenario poses a significant risk based on EPA cancer risk or non-cancer risk guidelines, the influential chemicals have been highlighted in the Risk Characterization section (Sections 6.5 and 7.5). If carcinogenic PAHs are significant, they have been so noted in the Risk Characterization.

The soil and sediment summary tables have been revised to show individual and total carcinogenic PAHs.

Specific Comments:

Comment #1 **Figure 3-4 and 3-5:** Symbol for Fill and Weathered Shale appears to be incorrectly shown.

Response #1 **Acknowledged.** This discrepancy has been corrected.

Comment #2 **Figure 4-10 through 4-13:** These figures lack units of measurement. Please revise the figures.

Response #2 **Acknowledged.** The figures have been revised to show units of measurement.

Comment #3 **Tables 4-22 and 4-28:** These tables also lack units of measurement. Please revise these tables.

Response #3 **Acknowledged.** These tables have been revised to show units of measurements.

Comment #4 **Table 6-3:** On page 7 of this table the Reasonable Maximum Exposure (RME) concentration for chromium in sediment is listed as 0.000 MG/KG. The actual concentration, as listed in Table 4-13 and Table 6-3 is 76.6 MG/KG. Is this a typographical error or was the RME of 0.000 actually used in risk calculations?

Response #4 **Agreed.** The typographic error in Table 6-3 has been corrected.

Comment #5 **Section 6.3.2.1 - Onsite Receptors:** It is not completely appropriate to state that "there is no pressure to develop land in this area". It must be kept in mind that the Local Redevelopment Authority is working very hard to develop productive reuses of the base property in order to minimize the negative impact that base closure will have on the

surrounding community. As such, it appears to us that there is indeed a great deal of pressure to develop this area.

Response #5

Agreed. The BRAC process has been developing over the last two years. When this report was first prepared the future land use was as it had always been, i.e., part of the military mission associated with SEDA. The BRAC closure process has now provided directions as to future land use and this has been incorporated into this document where appropriate. The sentence referring to pressure to develop land has been deleted.

Comment #6

Table 6-7: According to the footnotes in this table, the average time (AT) in days for the noncarcinogenic effects should be 10950 days. However, the column lists a value of 9125 days. Which figure was actually used in the calculation of non-carcinogenic risk? Please correct the discrepancy.

Response #6

Agreed. The table has been corrected.

Comment #7

Sections 6.5.5.2 and 7.5.5.2 - Uncertainty in Exposure Assessment: These sections must include a discussion of how the lack of dermal absorption factors (ABS), for all the compounds of concern except cadmium and PCBs, seriously underestimates risk. By using an ABS value of zero in the calculation of absorbed dose the result is, naturally, zero absorbed dose and thus zero risk. This result is misleading as many chemicals are indeed known to cause adverse health effects from a dermal exposure pathway. For instance, skin application of benzo(a)anthracene and benzo(a)pyrene are known to cause cancer in animals and are suspected of causing cancer in humans. In order to provide a complete picture of reviewers of this document the consultant must accurately and thoroughly discuss underestimations of risk as well as overestimations of risk.

The consultant may want to consider developing a table which lists on one side factors that will lead to an overestimation of risk (i.e., sampling bias) and on the other side factors which will lead to an underestimation or risk (i.e., lack of ABS values).

Response #7

Agreed. A paragraph has been added to the Sections 6.5.5.2 and 7.5.5.2 which discusses the potential underestimation of risk associated with the limitation of dermal exposure assessments to five compounds.

Comment #8

Sections 6.5.5.4 and 7.5.5.4 - Uncertainty in Risk Characterization: These sections seem to be saying that by ignoring possible synergism's between chemicals, risk if overestimated. In truth, by not considering the potential for synergism and potentiation between chemical contaminants, risk is actually underestimated. These sections should also contain definitions of the terms synergism and antagonism.

Response #8

Agreed. The paragraph in Sections 6.5.5.4 and 7.5.5.4 has been expanded to provide a more complete discussion of synergism and antagonism, and the uncertainties associated with ignoring these possible interactions. The discussion of synergism has been corrected to state that ignoring synergism underestimates risk.

Draft RI for the Fire Training Areas

Comments by Frye

Comment #1 Per EPA Guidance, the RI report should discuss, at a minimum, chemical-specific ARARs (scattered references to MCLs and NYS GA groundwater standards are made throughout the text). Also per EPA Guidance, an RI report should contain a conclusion/recommendation section wherein the recommendation for no-further-action or to perform a Feasibility Study is made. This recommendation is based upon the result of the risk assessment and ARARs (note, TAGMs are NOT ARARs). Include a separate section discussing chemical-specific ARARs which includes a listing of all identified chemical-specific ARARs and a comparison of each COC thereto as wells as a conclusion/recommendation section in the report.

Response #1 As required by 40 CFR Part 300.430(b)(9), project scoping for remedial investigations/reasibility studies (RI/FS), a preliminary list of ARARs and "To-Be-Considered"(TBCs) was developed and presented in the Project Scoping Plan for SEAD-25 and SEAD-26 (July 1995). These included separate tables for Location Specific ARARs, Action Specific ARARs and Chemical Specific ARARs. The data collected from the RI is compared to applicable chemical specific ARARs. It is the intention of the EPA that ARARs must be attained for any hazardous substances left on site at the completion of remedial actions and that remedial actions should also comply with ARARs. The list of ARARs will be refined and evaluated during the RI/FS process. Each ARAR identified in the Project Scoping Document will be evaluated to determine if they are applicable and relevant and appropriate based upon jurisdictional requirements (in the case of applicability) and appropriate and relevant based on a comparison of the action, location, or chemicals covered by the requirement and related conditions of the site. Only those requirements that are determined to be both relevant and appropriate must be complied with. The detailed analysis of chemical specific, action specific, and location specific ARARs is presented in the feasibility study report. Section 8 of the Draft RI provides a summary section of the results of the RI. Text has been added to provide further discussions of the chemical specific ARARs and recommendations for a feasibility study including a detailed analysis of remedial alternatives.

Comments by Bradley

Comment #1 Previous comments adequately addressed.

Response #1 Acknowledged.

Comments for
Draft RI for the Fire Training Areas
by The United States Environmental Protection Agency (USEPA)

Draft RI for the Fire Training Areas

General Comments

Comment #1 The report should present a discussion of data validation issues and data usability as it relates to the DQO which have been set for the site. The text should present rationale for the data rejections which are presented in the data tables and how these data rejections may affect the overall usability of the data.

Response #1 **Acknowledged.** Sections 6.2 and 7.2 of the report describe the data usability issues such as data validation, analytical methods, precision, accuracy, representativeness, comparability and completeness.

Comment #2 The results of the grain-size distribution analyses for the sediment samples were not presented in the document as originally discussed in the work plan for these sites. The results of the hardness analyses or TOC analyses were also not presented or discussed in the RI Report. The TOC analyses should be used to correct the site-specific TAGMs based on the TOC results, as is discussed in TAGM-4046.

Response #2 **Acknowledged.** The grain size analysis results for the sediment samples are shown in Appendix A. The average site-wide value for TOC is approximately 1% and therefore the TAGMs for soil were not adjusted.

Specific Comments

Section 1.0

Comment #1 **Page 1-20, P2:** The third sentence of this paragraph appears to be incomplete. The sentence should be reviewed and corrected as needed.

Response #1 **Acknowledged.** The sentence has been reworded to : ".....have been collected from 16 glacial till locations..... "

Comment #2 **Page 1-35; P1:** A figure should be provided showing the potentiometric head changes described in the text. The figure should be combined with the precipitation data for the same period.

Response #2 A potentiometric map was not developed because the precipitation data used was from a station located approximately 10 miles from the site. On-site precipitation data would be needed to accurately assess the local effects on groundwater levels.

Section 3.0

Comment #1 **Page 3-2, Sec. 3.1.3, P2:** It is reasonable to state that rainfall descreases during January and February, since at this time of the year precipitation would be frozen. It would be more appropriate if the text compared precipitation amounts throughout the year and not rainfall.

Response #1 **Agreed.** The text should state that the seasonal variations in precipitation are shown in Table 1-3. The text has been modified accordingly.

Comment #2 **Page 3-4, Sec. 3.1.4.2, P1:** The thickness of the till should be presented in the text.

Response #2 **Agreed.** The text has been modified to include the till thicknesses.

Comment #3 **Page 3-4, Sec. 3.1.4.2, P3:** Grain size distribution curves should be provided in the appendices of this document.

Response #3 **Agreed.** The grain size distribution curves are included in Appendix A.

Comment #4 **Page 3-5, Sec. 3.1.4.3:** The locations for the stated ranges of weathered shale should be presented in the text.

Response #4 **Agreed.** The text has been modified to include the locations of the weathered shale.

Comment #5 **Page 3-36, P2:** The locations stated where the competent shale was encountered should be presented in the document.

Response #5 **Agreed.** The text has been revised on Page 3-6 to state the location of the competent shale.

Comment #6 **Figures 3-4 and 3-5:** The shading used for the lithological units are reversed. The screened and open sections of each well should be shown on the geologic cross sections along with a water level mark for both shallow and deep wells at each cluster.

Response #6 **Acknowledged.** The shading for the lithological units has been corrected. Water level elevations have been added for the wells. Well construction details are provided in Table 2-4.

Comment #7 **Page 3-12, Sec. 3.1.5.1, P2:** The tense of the text here should be changed i.e., "..groundwater is expected..." should read, " groundwater was expected...."

Response #7 **Disagree.** This statement means that the groundwater flow should follow the slope of the bedrock surface. In this context, groundwater flow does not have a past tense, since it reflects the current conditions.

Comment #8 **Table 3-1:** The header should define whether the depths and elevations provided are for competent or weathered bedrock.

Response #8 **Acknowledged.** The travel times used to characterize bedrock surface were between 12,600 and 14,400 ft/sec. These correspond to competent shale formations. A footnote has been added to Table 3-1 clarifying this.

Comment #9 **Page 3-14, Sec. 3.1.6.2.1, P1:** What is "groundwater topography"? Should this be groundwater potentiometric surface or groundwater water table?

Response #9 **Acknowledged.** This sentence has been reworded from groundwater topography to groundwater contour.

Comment #10 **Figure 3-6:** There is no basis for the construction of the 736 equipotential contour line downgradient of wells MW25-15 and MW25-19.

Response #10 **Disagree.** The 736 contour line shown in this figure is inferred from the countours and the general topography of SEAD-25 and is appropriate for this site.

Comment #11 **Figure 3-7:** See comment above for the 736 contour line and apply to the 737 line in this figure.

Response #11 **Disagree.** See Response #10.

Comment #12 **Figure 3-8:** The 738 equipotential contour crosses the 738 topographic contour line in the area of well MW25-13. Field notes should be reviewed for indications that this "stream" was flowing at the time of water level measurements. If no water was present at this time the contouring in this figure should be corrected accordingly.

Response #12 **Acknowledged.** The stream was not observed to be flowing during the field investigation. The 738 contour line has been changed to a dashed line to indicate that this elevation is inferred.

Comment #13 **Figures 3-6 through 3-8:** Flow direction arrows should be drawn at 90 degrees to the equipotential contour lines. It is appropriate to construct hydrogeologic flow sections for the site to aid in an understanding of site flow conditions.

Response #13 **Acknowledged.**

Comment #14 **Figures 3-9 and 3-10:** The contouring presented should be truncated between control points and should be checked for accuracy (i.e., triangulation between data points).

Response #14 **Disagree.** The contouring shown in these figures represents reasonable extrapolations between the monitoring well elevations shown.

Comment #15 **Page 3-19, Sec. 3.1.6.2.2, P1:** It is not appropriate to calculate a horizontal flow gradient between MW25-5D and MW25-7D since these wells are parallel to the potentiometric contours shown on the figures. This may account for the large difference between the calculated gradients presented in the text.

Response #15 **Agreed.** This text has been removed from the section.

Comment #16 **Table 3-3:** Hydraulic conductivities have a logarithmic distribution and thus the average value presented in the table and associated text should be a geometric mean and not an arithmetic mean.

Response #16 **Acknowledged.** Since the data sets were determined to be lognormally distributed, the values for average hydraulic conductivity shown in Table 3-3 were re-calculated using a geometric mean rather than an arithmetic mean.

Comment #17 **Page 3-25, P1:** The results of the groundwater velocity calculations are incorrect since the values used for the average hydraulic conductivity are miscalculated, as previously commented.

Response #17 **Acknowledged.** The groundwater velocities were re-calculated using the new geometric means.

Comment #18 **Page 3-25, Sec. 3.1.6.4.3, P1:** See comment above on calculation of flow velocities.

Response #18 **Acknowledged.** See response #17.

Comment #19 **Figures 3-11 and 3-12:** A review of the detailed vegatative cover-type map (Figure 3-12) indicates that the areas mapped are different from those presented on Figure 3-11. This discrepancy should be corrected.

Response #19 **Acknowledged.** The figures have been revised to correct this discrepancy.

Comment #20 **Page 3-50, Sec. 3.2.4.2, P2:** A description of the Darian silt-loam is presented in the text. However, a review of text and the figure indicates be removed or clarified to state that the description is for the area surrounding the site.

Response #20 **Acknowledged.** A statement referring to the areas surrounding the site has been added to the text.

Comment #21 **Page 3-50, Sec. 3.2.4.2., P3:** See previous comment on the presentation of grain-size distribution curves.

Response #21 **Acknowledged.** See comment #3.

Comment #22 **Page 3-52, P2:** MW26-1 is located to the east of the site and not west, as stated in the text.

Response #22 **Acknowledged.** The text has been revised accordingly.

Comment #23 **Figure 3-15:** The 738 contour line should pass through MW26-7, which has a reported elevation of 738.00.

Response #2 **Acknowledged.** The figure has been revised accordingly.

Comment #24 **Table 3-8:** See previous comment presented for Table 3-1.

Response #24 **Acknowledged.** Please see response #8.

Comment #25 **Page 3-57, P1:** Profile identifications should be presented on Figure 3-16 for ease of reference.

Response #25 **Acknowledged.** The location of the GPR profiles are shown in Figure 2-9.

Comment #26 **Page 3-61, Sec. 3.2.6.2, P1:** The April 4, 1994 data set contains four data points and not three, as stated in the text.

Response #26 **Agreed.** The text has been revised to state that the data set contains four data points.

Comment #27 **Figure 3-20:** The 744 potentiometric contour line should pass through MW26-10, which has a reported elevation of 744.00.

Response #27 **Agreed.** The figure has been revised accordingly.

Comment #28 **Figures 3-20 through 3-22:** The contour lines shown on these figures should be truncated between data control points.

Response #28 **Disagree.** The contour lines are considered to be reasonable extrapolations based upon the data collected.

Comment #29 **Page 3-66, Sec. 3.2.6.3:** See previous comment on the presentation of the hydraulic conductivity results.

Response #29 **Acknowledged.** The average hydraulic conductivity for SEAD-26 was re-calculated using a geometric mean.

Comment #30 **Table 3-10:** See previous comment on the calculation of hydraulic conductivity averages value.

Response #30 **Acknowledged.** Please see response #29.

Comment #31 **Page 3-66, Sec. 3.2.6.4:** See previous comment on the calculations of flow velocities.

Response #31 **Acknowledged.** The groundwater velocities for SEAD-26 were recalculated using the new hydraulic conductivities based on a geometric mean.

Comment #32 **Figure 3-23 and 3-24:** These figures do not match, the discrepancy should be corrected. The arrow indicating the site in Figure 3-24 is not pointing to the site boundaries.

Response #32 **Acknowledged.** This discrepancy has been corrected.

<u>Section 4.0</u>

Comment #1 **Page 4-1, Sec. 4.0:** The text should clearly state that both DQO documents will be referenced in the RI Report.

Response #1 **Agreed.** The text has been modified accordingly.

Comment #2 **Figure 4-1:** There are locations on this figure which should be contoured with a 1 ppmv contour line, which have not been identified in the text as being related to non-contaminant sources.

Response # **Disagree.** A review of the data did not indicate locations that should be contoured in addtion to those shown on the figure.

Comment #3 **Table 4-5:** TAGM 4046 lists a concentration or the MDL for several compounds. In these instances, the lower of the two numbers should be used for determining which samples exceed the TAGM guidance values.

Response #3 **Acknowledged.** The soil cleanup standards listed in Table 4-5 follow the guidelines established in TAGM 4046.

Comment #4 **Table 4-7:** There is a TAGM value for 1,2-dichloroethene (trans) of 300 ug/kg. It is appropriate to use this value for 1,2-dichloroethene (total) since these compounds typically co-elute and are not differentiated by the laboratory. The use of this value should be reflected in the associated text. There is also a value for chlordane in TAGM-4046 which should be used for comparison with alphachlordane

results. The heading for the last two pages of this table has been cut-off and should be corrected.

Response #4 **Acknowledged.** The TAGM for chlordane has been added and the corrections to the heading have been made.

Comment #5 **Page 4-38, P2:** A figure showing the distribution of semi-volatile (PAHs) in soils should be presented in the RI Report.

Response #5 **Acknowledged.** A figure (Figure 4-16) showing the distribution of PAHs in soils at SEAD-25 has been added to the report.

Comment #6 **Page 4-41, P2:** It is not appropriate to discuss health-related issues in the nature and extent section. The text in this section should discuss the exceedaneces related to guidance values and leave the discussion of health risk to the health risk section.

Reponse #6 **Acknowledged.** This reference has been deleted from the text.

Comment #7 **Page 4-41, P4:** The text should state the concentrations of the samples discussed.

Response #7 **Acknowledged.** The concentrations of the samples discussed have been added to the text.

Comment #8 **Page 4-42, Sec. 4.1.5, P1:** The text should present a comparison between all three rounds of sampling, and how the groundwater chemistry has changed through time.

Response #8 **Acknowledged.** An analysis of changes or trends over time for the groundwater data was not conducted due to the limited data set, and the fact that many of the wells were not installed in earlier sampling rounds. Additionally, the statistical summary table (Table 4-9) shows that there was a 0% frequency of detection for many of the analytes, and a low frequency of detection for the remainder of the organic analytes showing a hit. The metals data may be subjected to a non-parametric type statistical trend analyis after additional sampling rounds are conducted.

Comment #9 **Table 4-9:** Please explain why the "total counts" presented in the groundwater summary table varies from method to method and within each method.

Response #9 The total counts vary under the volatile organics from compound to compound due to the use of either Method 524.1 or TCL volatile organics. The use of both methods was due to the request by EPA to include the 524.1 analysis on certain wells.

Comment #10 **Table 4-10:** The order in which the wells are presented is confusing. The wells should be presented in numerical order.

In addition to NYSDEC GA groundwater standards, Federal MCLs should also be included for each contaminant. The table incorrectly states that there are no standards for Bromoform, Antimony, Beryllium and Thallium, which all have Federal MCLs.

Response #10 **Acknowledged.** The table has been modified to include MCLs if the MCL is lower than the NYSDEC GA groundwater standard or if no GA standard exists for a compound. The order of the wells is due to the manner in which the relational database is queried to create the tables.

Comment #11 **Page 4-65, Sec. 4.1.5.2:** A figure showing the distribution of total, semi-volatiles (including TICs) should be presented in this report.

Response #11 **Acknowledged.** A figure showing the concentrations of SVOCs and TICs in the shallow groundwater from round 2 (March 1996) has been added as Figure 4-15 to the report.

Comment #12 **Page 4-66, P1:** A discussion of the TICs found in Round 2 sample analysis results should be presented.

Response #12 **Acknowledged.** A discussion of the SVOC TICs in groundwater has been added to the section

Comment #13 **Page 4-67, P1:** The text speculates about the origin of the inorganics found in the groundwater. More justification should be given for the conclusions presented here.

Response #13 **Acknowledged.** This statement has been removed from the text. A statistical analysis of background metals concentrations compared to the groundwater sampling concentrations is presented in Section 6.0.

Comment #14 **Page 4-74, P1:** The text states that SW25-6 was not used as background since it was "... impacted by other constituents, not associated with past site activities...: but the text does not elaborate what these impacts were or what caused them. A discussion of these impacts should be presented in the text.

Response #14 **Agreed.** The impacts referred to in the report are elevated levels of SVOCs, and PAHs detected in the sediment sample at this location; presumably from storm drain discharges.

Comment #15 **General Comment:** The results of the average and standard deviations should be rounded to reasonable numbers since the analytical methods cannot typically detect these compounds down to the numbers presented here.

Response #15 **Acknowledged.**

Comment #16 **Page 4-78, Sec. 4.1.7.1, P1:** Toluene is not considered a common laboratory contaminant and the discussion in the text referring to toluene as such should be removed.

Response #16 **Disagree.** Even though toluene is not as common a lab contaminant as acetone, 2-butanone and carbon disulfide, it has been shown to be an artifact from laboratory cross-contamination. Due to the low concentrations present and the fact that toluene has not been shown to be a contaminant of concern at SEDA, it is reasonable to assume that its presence is due to laboratory contamination. The text has been revised to state that the presence of these compounds may be due to laboratory cross-contamination.

Comment #17 **Table 4-14:** The source listed for Di-n-buthylphthalate is given as "????". What is this source?

Response #17 **Acknowledged.** This has been corrected to show none, meaning there are no current sediment quality criteria for this compound.

Comment #18 **Page 4-78:** Is the drainage ditch discussed here "...north..." the northwest ditch previously discussed?

Response #18 The location of the drainage ditch mentioned in this paragraph can be confirmed by the referenced sample locations.

Comment #19 **Table 4-14:** The abbreviations for the sources listed should be presented as footnotes to this table. What is the "west Effect Le" which is listed as a source? If a compound has been qualified as rejected, the concentrations should be removed from the tables and only the qualifier "R" shown.

Response #19 **Acknowledged.** The source abbreviations have been corrected and identified in the table.

Comment #20 **Page 4-86, Sec. 4.1.7.6:** The text states that MW25-2 had the maximum TPH concentration. This appears to be incorrect since this section discusses sediment sample results. The previous paragraph identifies surface water samples. Again, this appears to be incorrect in a sediment discussion.

Response #20 **Acknowledged.** The text has been changed to show the sediment location as SD25-8 rather than MW25-2 and the reference to surface water has been changed to sediment.

Comment #21 **Page 4-86, Sec. 4.1.8:** The text here should state that the site has been impacted by TPH. This section should also summarize the results of the soil gas survey and relate these results to the groundwater and soil sample results.

Response #21 **Acknowledged.** The text has been revised to include TPH. A discussion relating the soil gas survey result to the groundwater and soil sample results has been added to Sec. 4.1.8.

Comment #22 **Table 4-16 and 4-17:** Why do the "total counts" vary between some of the compounds? The asterisks represented on Table 4-17 should be added to the list of notes.

Response #22 Please see comment #9

Comment #23 **Table 4-22:** See previous comments on the variation between total counts.

There are not units presented on this table.

Response #23 Please see response #9. Units have been added to the table.

Comment #24 **Table 4-23:** The wells are not presented in numeric order, is there a significance in the way the wells are presented?

Response #24 The order that the wells appear in this table is a function of the structure of the database and the manner in which the database information is accessed.

Comment #25 **Page 4-155:** The results of all the inorganics should be discussed, especially when analytes exceed their guidance values by as much as 29,900 times, as in the case for calcium.

Response #25 **Acknowledged.** The table incorrectly showed a standard of 50 ug/l for calcium. There is no current groundwater standard for calcium. The table has been corrected to show this.

Comment #26 **Page 4-156, Sec. 4.2.41:** The text here references SEAD-25. This should be corrected to state SEAD-26.

Response #26 **Acknowledged.** The reference has been changed accordingly.

Comment #27 **Table 4-24:** See previous comment on total count variations.

Response #27 Please see response #9.

Comment #28 **Table 4-25:** See previous comment on the "standard source" as it applies to heptachlor.

Response #28 **Acknowledged.** The reference has been changed to New York State Class C Surface Water Standard.

Comment #29 **Page 4-163, Sec. 4.2.4.2:** The standard referenced here for surface waters is incorrectly given as "... New York State Class GA..."

Reponse #29 **Acknowledged.** The text has been changed to New York State Class C Surface Water Quality standards.

Comment #30 **Page 4-164, P1:** The text here references groundwater. This text should be corrected to state surface water.

Response #30 **Acknowledged.** The reference has been changed to surface water.

Comment #31 **Figure 4-14:** The flow direction of the surface water bodies should be presented to aid in interpretation of results.

Response #31 **Acknowledged.** A map showing the surface water flow direction for SEAD 26 is presented in Figure 3-14.

Comment #32 **Page 4-173, Sec. 4.2.5.3:** The text should state the concentrations of contaminants detected and not only state the number of times the contaminants exceeded their respective guidance values.

Response #32 The concentrations of pesticides and PCBs are presented in the preceding Table 4-27.

Comment #33 **Page 4-176, Sec. 4.2.5.6:** The text discusses surface soil results in a section which presents sediment results.

Response #33 **Acknowledged.** The text has been revised to sediment results.

Comment #34 **Page 4-177, Sec. 4.2.6:** Paragraph 3 states that no criteria exceedances were deteced for VOCs in groundwater at SEAD 26. The text should be corrected, as benzene and ethylbenzene were detected above NYSDEC Class GA standards.

Response #34 **Agreed.** The text has been changed to state that the NYSDEC GA standards were exceeded for benzene and ethylbenzene in two wells.

<u>Section 5.0</u>

Comment #1 The Fate and Transport chapter of this RI includes information about the physical and chemical characterstics of the site and the site contaminants. It also includes three modeling efforts (a water balance, fugacity modeling, and one dimensional tranport modeling). It does not, however, provide clear conclusions on the potential fate and transport of contaminants at the two sites. Any conclusions concerning the sites are fragmentary and scattered throughout the section. No overall conclusions concerning the site are presented.

A number of general observations concerning the section as a whole are as follows. Most of these affect the usability of the section at the end of

the chapter. This section should bring together the physical and chemical characterstics of the site and contaminants and the results from the three models. From this, a unified description of the qualitative and, if the data permit it, quantitative description of the primary fate and transport mechanisms acting on each site should be presented.

- Conclusions: The main points of the fate and transport analysis should be summarized in a conclusions section at the end of the chapter. This section should bring together the physical and chemical characteristics of the site and contaminants and the results from the three models. From this, a unified description of the qualitative and, if the data permit it, quantitative description of the primary fate and transport mechanisms acting on each site should be presented.

Response #1 **Acknowledged.** Section 8.0 presents a summary of the fate and transport analysis and the risk assessment for SEAD-25 and SEAD-26.

Comment #2 **Page 5-1, P4:** As shown on Figure 1-3, the elevated pad is <u>not</u> defined by the 742 foot contour.

Response #2 **Disagree.** The fire training pad is located within the 742 foot elevation contour according to Figure 1-3.

Comment #3 **Page 5-2, P3:** Figure 1-13 is not rainfall information. Consider restating the information, or a portion of it, in this section since it is fundamental to the analysis.

Response #3 **Agreed.** The figure reference has been corrected to Figure 1-14 and the references to rainfall have been changed to precipitation.

Comment #4 **Page 5-3, P3:** Water Balance: Why are 1975 and 1957 models and information being used? Why not use more recent models such as the HELP model. Also, what is the point of this exercise? The text states that "understanding the water balance of the site is helpful in evaluating the containmant fate and transport at SEAD-25," yet this analysis or its results are not referred to at all in the rest of the chapter.

When presenting an analysis of this type, the general methodology, assumptions and results should be presented and explained as necessary in the text, with the details of the analysis presented in an appendix. This also applies to the modeling given in sections 5.3 and 5.4.

Response #4 **Acknowledged.** The water balance models presented are standard models that were used to estimate the amount of runoff and evapotranspiration at the site as part of the overall water budget. The results of the water balance are described at the end of section 5.1.1 for

SEAD-25 and section 5.2.1 for SEAD-26. This information is presented to qualitatively and semi-quantitatively assess the potential effects of precipitation on contaminant transport in the vadose zone. Text has been added to indicate that the potential for infiltration of vadose zone contaminants is moderate since most of the water is lost to evapotranspiration or runoff. It also describes the effects on surface water flow and sediment contaminant transport. The HELP model was developed for landfill applications and is therefore not considered appropriate for these sites.

Comment #5 **Page 5-5, P4:** These assumptions concerning snowfall and snowmelt given here are gross generalizations which appear to be the direct cause of the results presented in para 2, Page 5-7.

Response #5 **Acknowledged.** The assumptions stated for snowmelt and snowfall may be somewhat conservative. The results discussed on page 5-7 merely reflect the assumptions made in the previous section.

Comment #6 **Page 5-7, P2:** See comment Page 5-5, p4 above.

Response #6 See response #5.

Comment #7 **Page 5-7, P3:** An explanation of how these results factor into the fate and transport of contaminants at the site should be given in the text.

Response #7 **Acknowledged**. Text has been added to indicate that the BTEX and VOCs in the subsurface at SEAD-25 would not be expected to migrate via this pathway.

Comment #8 **Page 5-7, P4-5:** Summary tables or figures of the analytical results should be reproduced or referenced.

Response #8 **Acknowledged.** References for the summary tables have been inserted in the text.

Comment #9 **Page 5-12, P1:** Reference the section with the discussion of the water balance.

Response #9 **Acknowledged.** A reference for the section discussing the water balance for SEAD-25 has been inserted.

Comment #10 **Page 5-13, Table 5-2:** This table should only include compounds which are relevant to SEAD-25 and SEAD-26. Delete any compounds which are not of concern at the site. Also, the table should not include bioconcentration factors, which are not relevant to this section, or half-life, which is highly dependent on the circumstances under which it is measured.

Response #10 **Acknowledged.** The table has been revised to show the list of compounds of concern that corresponds to the list of compounds shown in Table 6-4, which are the list of compounds quantified in the human health risk assessment. Bioconcentration factors and half-lifes were included as a point of discussion but were not considered relevant for this site. Therefore they have been removed from the table as requested.

Comment #11 **Page 5-20, P2:** The statement that VOCs degrade or decay over time conflicts with various other statements in this chapter concerning degradation of various compounds. Please clarify.

Response #11 This paragraph is meant to describe possible mechanisms affecting the fate and transport of organic chemicals in both groundwater and soils at the site. Specific discussions on the biodegradability of BTEX, chlorinated organics, and PAHs are presented later in the section. The statements made concerning the biodegradation of these specific compounds indicate that the available data on the biodegradability of benzene are contradictory and that toluene and ethylbenzene are generally considered to be biodegradable in the subsurface environment. Data concerning the biodegradability of xylenes is not readily available. Biodegradation of chlorinated organics is not considered a significant migration pathway in the subsurface under most environmental conditions, whereas PAHs , especially the lighter molecular weight compounds, are biodegradable under most environmental conditions.

Comment #12 **Page 5-21, P1:** It is irrelevant how many of the compounds listed in Table 5-2 will volatilize. Discussions in the text should be confined to the contaminants of interest at the site. See also the discussion of Table 5-2 at Page 13ff.

Response #12 The discussion in this paragraph is meant to be a general introduction to the concept of Henry's Law and the factors affecting volatization of organic compounds in the subsurface. More specific discussions related to the chemicals of concern at the site are presented later in the section. The reference to Table 5-2 has been removed.

Comment #13 **Page 5-21, P2:** General statements such as those which begin in this paragraph should be left out unless they are related to specific concerns at the site.

Response #13 As in the above response, this paragraph is a general introduction to residence times. Specific discussions concerning the compounds of concern at the site are discussed later in the section.

Comment #14 **Page 5-21, P4:** How much of the "following information" was obtained from the referenced document? This material should be properly referenced. Also, reproduction of information from a reference should

be limited to that which is directly applicable to the specific site situation.

Response #14 As the paragraph states, the information in the section under aromatic volatile organics was obtained from the referenced document. This information is considered to be relevant to the site.

Comment #15 **Page 5-21, P5:** Equilibrium partitioning assesses distribution of contaminants at steady-state, it does not assess transport pathways.

Response #15 **Acknowledged.** However, the general principles of equilibrium partitioning help to determine how much of the chemical will partition in the water, soil or air phases under equilibrium conditons and thereby what transport pathway will predominate.

Comment #16 **Page 5-22, P3:** The mass of contaminants which are transported in the vapor phase is generally small compared to other modes of transport. Also, it is only minimally affected by barometric pressure. Please explain how it would be affected by convection currents.

Response #16 Convection currents result from the transfer of heat by fluid motion between regions of unequal density resulting from nonuniform heating. In the subsurface, the mass transfer of vapor phase contaminants at SEAD 25 and 26 could be affected by convection currents from the uneven heating of the ground.

Comment #17 **Page 5-22, P5:** Is the affect of salinity on the Henry's Law constant relevant to this site? If so, the reason should be stated, if not, reference to it should be deleted here and in the several other places that it occurs in this chapter.

Response #17 Sodium, manganese, and other mineral salts are present in the groundwater at the site. The concentrations present may contribute to elevated Henry's Law constants for some organic compounds. This statement has been added to the text.

Comment #18 **Page 5-22, P6:** Please explain why releases to the atmosphere and tropospheric lifetime are important factors at these sites.

Response #18 **Acknowledged.** Tropospheric lifetime is not relevent. This paragraph has been removed from the section.

Comment #19 **Page 5-23, P2:** Please clarify the third and fourth sentences "Volatilization represents...".

Response #19 Volatilization of TCE and 1,2-DCE is considered a significant migration pathway because of the relatively high vapor pressures and Henry's Law constants for these compounds. The partitioning of these compounds from groundwater to the vapor phase is directly proportional to the

concentrations in groundwater. At the concentrations of TCE detected in groundwater at SEAD-25 (10 ppb average), the partitioning of this comound into the vapor phase would not be significant. The text has been revised to show that these pathways may be significant if the groundwater concentrations are sufficiently high.

Comment #20 **Page 5-23, P4:** Solubility does not "cause impacts to the groundwater". Please restate or delete. Also, what is the relevance of the state of TCE and DCE since no pure product was found?

Response #20 **Acknowledged.** This statement has been removed from the text. The physical state of TCE and DCE at room temperature is not particularly relevant to the site conditions but does provide a relative indicator and has been retained in the text for reference.

Comment #21 **Page 5-23, P5:** Vapor pressure is not relevant to fate and transport since no pure product was found. Relative humidity and barometric pressure effects on vapor pressure would be negligible in the event that pure product were present.

Response #21 **Acknowledged.** However, the vapor pressure would be relevent to these compounds in the vadose zone.

Comment #22 **Page 5-24, P3:** Please explain how "soil, sediment, and suspended particulate matter represent an important media for the transport of the chemicals."

Response #22 Soil.and sediment act as transport media through erosion and transport by surface water overland flow, infiltration and percolation of precipitation and stream flow, and suspended particulate matter through airborne transport and groundwater flow transport.

Comment #23 **Page 5-24, P5:** Provide backup for this paragraph or delete it. Both biodegradation and volatilization are generally insignificant for PAHs.

Response #23 **Acknowledged.** This paragraph has been removed.

Comment #24 **Page 5-25:** Partitioning Model of Fugacity: See Page 5-3, p 3ff comment.

Response #24 Please see response #4.

Comment #25 **Page 5-25, P1:** Why is the fugacity model for VOCs being applied to SEAD-26 when 5.2.2, Chemical Characterization, states that various appropriate limits for VOCs in different media were not exceeded.

Response #25 Fugacity modeling for VOCs at SEAD-26 will provide a better understanding of the fate and transport characteristics of the low levels of VOCs detected in soils.

Comment #26 **Page 5-39, P2:** There is no figure 5-1 showing TCE breakdown products.

Response #26 **Acknowledged.** The reference to this figure has been deleted.

Comment #27 **Page 5-34, 5-39 Fugacity model results:** The results were not related to the existing conditions on the sites. How well do the model results represent what is happening at the sites? How can this information be used to predict what will happen on the site?

Response #27 The fugacity modeling results predict the partitioning of BTEX and chlorinated solvents in groundwater and soils based upon the assumptions stated earlier in the section. This information is used to assess the degree to which the site contaminants will be available for degradation processes, the potential for migration and to assess potential exposure pathways for the human health risk assessment.

Comment #28 **Page 5-41, P2:** How does this relate to conditions at these sites?

Response #28 Based upon the information presented in this section, TCE which was found in soils and groundwater at SEAD-25 and in soils at SEAD-26, are expected to be moderately sorbed to soils (characterized as till with a high percentage of silt and clay); and that the TCE will be relatively persistent due to the absence of any significant degradation mechanisms.

Comment #29 **Page 5-42, P2,3:** How do the various items mentioned here pertain to the site? Is photochemical oxidation of TCE in air, or the half-life of TCE in water relevant?

Response #29 The paragraphs discussing photoxidation and biodegradation have been deleted from the text since the information presented is not necessarily relevant or conclusive.

Comment #30 **Page 5-42, P4:** The information in this paragraph is incorrect; there is considerable evidence in the literature to microbial biodegradation of PCE and TCE in both laboratory and field environments. What is the purpose of the statement "Biodegradation should be assumed to be of minimal importance except in landfills with active microbial populations"? This type of statement needs to be related to the conditions at the site and backed up with further technical information.

Response #30 This paragraph has been deleted.

Comment #31 **Page 5-42 to 46, Semivolatile Organic Compounds:** A considerable amount of space is devoted to discussing the properties and possible fate

and transport pathways of 2,4-dimethylphenol and naphthalene, which are the two most prevalent SVOCs on the two sites. However, there is no attempt made to identify how these properties and pathways are applicable to the sites being examined.

Response #31 Section 8.0 summarizes the fate and transport characteristics at both SEAD-25 and SEAD-26.

Comment #32 **Page 5-45, P2:** Naphthalene does not have a "relatively high aqueous solubility." Also, the conclusion in the closing statement is not supported by the beginning of the paragraph.

Response #32 **Agreed.** This paragraph has been deleted.

Comment #33 **Page 5-46, P5:** It is incorrect to say that the vadose zone does not need to be modeled with the transport model because it was already estimated within the fugacity modeling. These are entirely different models, the fugacity model being a simple steady state model of contaminant distribution, and the transport model being a time-dependent dynamic model of contaminant movement.

Response #33 **Acknowledged.** This statement has been deleted from the text.

Comment #34 **Page 5-48, Input Parameters:** The nomenclature listed does not match the formula nomenclature (English and Greek mixed, upper and lower case differences). Also, there is no justification for the values listed in Table 5-6, contrary to what the text states.

Reponse #34 **Acknowledged.** The model used in the pre-draft RI has been replaced with a more updated solute transport model (BIOSCREEN) that was not available when the pre-draft report was submitted for review. This model simulates natural attenuation and transport of dissolved hydrocarbons based upon the Domenico analytical transport model. This model is considered to be appropriate for evaluating the potential for natural biodegradation of BTEX contaminants at both SEAD-25 and SEAD-26 using some simplifying assumptions. This model is approved by the EPA and has been used at many disposal sites as a tool for detemining the no-action alternative and for identifying potential sensitive groundwater receptors.

Comment #35 **Page 5-48, P "The graphical...":** Figure 5-1 should be given as four separate figures.

Response #35 **Acknowledged.** The figures have been changed to show the results of the BIOSCREEN modeling as described above and are referenced and numbered separately.

Comment #36 **Model Output:** The actual concentration used at distance "0", 3.98 mg/l, does not correspond to Figure 4-3 which gives the concentration at the source as 3.04 mg/l.

Response #36 Please see comment #34.

Comment #37 **Page 5-49, P4:** Why is the model being run for BTEX at SEAD-26? Section 5.2.2 seems to indicate that VOCs (i.e. BTEX) are not a concern at this site.

Response #37 BTEX was detected in 2 out of 23 groundwater samples at SEAD-26. The highest concentrations of total BTEX (15 ppb) were found in MW26-7 which is at the periphery of the source area (the fire training pit). Other VOCs were also detected at low concentrations including trimethylbenzenes. Due to the low hits on VOCs at SEAD-26, the pre-draft RI stated that VOCs were not of concern. However, the presence of these compounds, even at these concentrations, requires further analysis to determine the migration potential and if they pose a potential threat to human health or the environment. Consequently, a simple solute transport model was used to determine the effects of natural attenuation at the site if no further actions or engineering controls were implemented. The BIOSCREEN model is used as a simple predictive tool to assess the relative effects of biodegradation on the VOCs in groundwater as well as the effects of dipersion and adsorbtion on solute concentrations. These results may be used to estimate the extent of plume migration over time and the time required to naturally degrade contaminant levels to regulatory cleanup requirements.

Comment #38 **Page 5-50, P1:** As with SEAD-25, it is unlikely that the conditions at SEAD-26 represent one-dimensional flow in a homogeneous, isotropic medium. Note the description of the site on Page 10, P2: "The burning pit and surrounding area is composed mostly of fill that is from 6.0 to 14.0 feet thick. On the basis of excavations performed at SEAD-26, the fill contains non-metallic construction debris and boulders as well as metallic debris (e.g., pipes, bucket, steel fragments)."

Response #38 **Acknowledged.** The site geology at SEAD-26 is composed of a mixture of fill materials and glacial till and weathered shale. The pre-draft RI describes the fill material as having a similar compostition to the till and that the contact between the two was not distinct. Hydraulic conductivities were measured in 8 monitoring wells around SEAD-26. The geometric mean of the conductivities was used in the BIOSCREEN model to determine the seepage velocity. The hydraulic conductivities ranged from 1.5×10^{-3} to 3.9×10^{-3}. The conductivities indicate that the geology in SEAD-26 is fairly homogeneous within the confines of the area modeled. However, this geology is not considered to be representative of the geology outside the confines of SEAD-26 or other areas of SEDA as evidenced by the fairly high seepage velocity of 130 ft/yr. A discussion of the modeling for SEAD-26 using the

BIOSCREEN model states that the one of the simplifying assumptions for the model is that the aquifer is homogeneous and isotropic.

Comment #39 **Tranport Modeling, General Comments (see also p 5-3, p 3ff comment):** This modeling effort will require much more support before it can be considered credible for predicting fate and transport on these sites. More background on the model should be provided, including its general methodology, input parameter requirements, assumption made, resulting output, model limitations, and model sensitivity. Appropriate backup should be provided for all of the input values given in Table 5-6. Consider including a generic diagram indicating what the model accomplshes and maps depicting the model output for each site.

Appendix I (ODAST Model), should be referred to in the text if it is being used to support the analysis. The equations given in the text do not correspond to the equations given in the appendix. The output graphs given in the appendix also seem to bear no relation to the information given in the text. The concentration input for BTEX at SEAD-25 given in the Appendix (3.04 mg/l) corresponds to Figure 4-3 but does not correspond to Table 5-6. (See also Model Output comment). As it stands, the information given in the appendix and the text is insufficient to determine if the model results are credible.

It is unclear what simplifications were made to the model for its application to SEAD-26. These should be more clearly stated.
The validity of the modeling effort for predicting the change in concentration with time is questionable since only one true data point is available for each site. For SEAD-25, the concentration versus time graph is generated from this single data point and an initial condition based on the results of a previous model run, and cannot be considerable reliable. For SEAD-26 the prediction is based solely on an initial concentration in one well and cannot be considered reliable.

Response #39 See response # 34.

Comments for
Draft RI for the Fire Training Areas
by The United States Environmental Protection Agency (USEPA)

Draft RI for the Fire Training Areas

General Comments

Comment #1 The report should present a discussion of data validation issues and data usability as it relates to the DQO which have been set for the site. The text should present rationale for the data rejections which are presented in the data tables and how these data rejections may affect the overall usability of the data.

Response #1 **Acknowledged.** Sections 6.2 and 7.2 of the report describe the data usability issues such as data validation, analytical methods, precision, accuracy, representativeness, comparability and completeness.

Comment #2 The results of the grain-size distribution analyses for the sediment samples were not presented in the document as originally discussed in the work plan for these sites. The results of the hardness analyses or TOC analyses were also not presented or discussed in the RI Report. The TOC analyses should be used to correct the site-specific TAGMs based on the TOC results, as is discussed in TAGM-4046.

Response #2 **Acknowledged.** The grain size analysis results for the sediment samples are shown in Appendix A. The average site-wide value for TOC is approximately 1% and therefore the TAGMs for soil were not adjusted.

Specific Comments

Section 1.0

Comment #1 **Page 1-20, P2:** The third sentence of this paragraph appears to be incomplete. The sentence should be reviewed and corrected as needed.

Response #1 **Acknowledged.** The sentence has been reworded to : ".....have been collected from 16 glacial till locations..... "

Comment #2 **Page 1-35; P1:** A figure should be provided showing the potentiometric head changes described in the text. The figure should be combined with the precipitation data for the same period.

Response #2 A potentiometric map was not developed because the precipitation data used was from a station located approximately 10 miles from the site. On-site precipitation data would be needed to accurately assess the local effects on groundwater levels.

Section 3.0

Comment #1 **Page 3-2, Sec. 3.1.3, P2:** It is reasonable to state that rainfall descreases during January and February, since at this time of the year precipitation would be frozen. It would be more appropriate if the text compared precipitation amounts throughout the year and not rainfall.

Response #1 **Agreed.** The text should state that the seasonal variations in precipitation are shown in Table 1-3. The text has been modified accordingly.

Comment #2 **Page 3-4, Sec. 3.1.4.2, P1:** The thickness of the till should be presented in the text.

Response #2 **Agreed.** The text has been modified to include the till thicknesses.

Comment #3 **Page 3-4, Sec. 3.1.4.2, P3:** Grain size distribution curves should be provided in the appendices of this document.

Response #3 **Agreed.** The grain size distribution curves are included in Appendix A.

Comment #4 **Page 3-5, Sec. 3.1.4.3:** The locations for the stated ranges of weathered shale should be presented in the text.

Response #4 **Agreed.** The text has been modified to include the locations of the weathered shale.

Comment #5 **Page 3-36, P2:** The locations stated where the competent shale was encountered should be presented in the document.

Response #5 **Agreed.** The text has been revised on Page 3-6 to state the location of the competent shale.

Comment #6 **Figures 3-4 and 3-5:** The shading used for the lithological units are reversed. The screened and open sections of each well should be shown on the geologic cross sections along with a water level mark for both shallow and deep wells at each cluster.

Response #6 **Acknowledged.** The shading for the lithological units has been corrected. Water level elevations have been added for the wells. Well construction details are provided in Table 2-4.

Comment #7 **Page 3-12, Sec. 3.1.5.1, P2:** The tense of the text here should be changed i.e., "..groundwater is expected..." should read, " groundwater was expected...."

Response #7 **Disagree.** This statement means that the groundwater flow should follow the slope of the bedrock surface. In this context, groundwater flow does not have a past tense, since it reflects the current conditions.

Comment #8 **Table 3-1:** The header should define whether the depths and elevations provided are for competent or weathered bedrock.

Response #8 **Acknowledged.** The travel times used to characterize bedrock surface were between 12,600 and 14,400 ft/sec. These correspond to competent shale formations. A footnote has been added to Table 3-1 clarifying this.

Comment #9 **Page 3-14, Sec. 3.1.6.2.1, P1:** What is "groundwater topography"? Should this be groundwater potentiometric surface or groundwater water table?

Response #9 **Acknowledged.** This sentence has been reworded from groundwater topography to groundwater contour.

Comment #10 **Figure 3-6:** There is no basis for the construction of the 736 equipotential contour line downgradient of wells MW25-15 and MW25-19.

Response #10 **Disagree.** The 736 contour line shown in this figure is inferred from the countours and the general topography of SEAD-25 and is appropriate for this site.

Comment #11 **Figure 3-7:** See comment above for the 736 contour line and apply to the 737 line in this figure.

Response #11 **Disagree.** See Response #10.

Comment #12 **Figure 3-8:** The 738 equipotential contour crosses the 738 topographic contour line in the area of well MW25-13. Field notes should be reviewed for indications that this "stream" was flowing at the time of water level measurements. If no water was present at this time the contouring in this figure should be corrected accordingly.

Response #12 **Acknowledged.** The stream was not observed to be flowing during the field investigation. The 738 contour line has been changed to a dashed line to indicate that this elevation is inferred.

Comment #13 **Figures 3-6 through 3-8:** Flow direction arrows should be drawn at 90 degrees to the equipotential contour lines. It is appropriate to construct hydrogeologic flow sections for the site to aid in an understanding of site flow conditions.

Response #13 **Acknowledged.**

Comment #14 **Figures 3-9 and 3-10:** The contouring presented should be truncated between control points and should be checked for accuracy (i.e., triangulation between data points).

Response #14 **Disagree.** The contouring shown in these figures represents reasonable extrapolations between the monitoring well elevations shown.

Comment #15 **Page 3-19, Sec. 3.1.6.2.2, P1:** It is not appropriate to calculate a horizontal flow gradient between MW25-5D and MW25-7D since these wells are parallel to the potentiometric contours shown on the figures. This may account for the large difference between the calculated gradients presented in the text.

Response #15 **Agreed.** This text has been removed from the section.

Comment #16 **Table 3-3:** Hydraulic conductivities have a logarithmic distribution and thus the average value presented in the table and associated text should be a geometric mean and not an arithmetic mean.

Response #16 **Acknowledged.** Since the data sets were determined to be lognormally distributed, the values for average hydraulic conductivity shown in Table 3-3 were re-calculated using a geometric mean rather than an arithmetic mean.

Comment #17 **Page 3-25, P1:** The results of the groundwater velocity calculations are incorrect since the values used for the average hydraulic conductivity are miscalculated, as previously commented.

Response #17 **Acknowledged.** The groundwater velocities were re-calculated using the new geometric means.

Comment #18 **Page 3-25, Sec. 3.1.6.4.3, P1:** See comment above on calculation of flow velocities.

Response #18 **Acknowledged.** See response #17.

Comment #19 **Figures 3-11 and 3-12:** A review of the detailed vegatative cover-type map (Figure 3-12) indicates that the areas mapped are different from those presented on Figure 3-11. This discrepancy should be corrected.

Response #19 **Acknowledged.** The figures have been revised to correct this discrepancy.

Comment #20 **Page 3-50, Sec. 3.2.4.2, P2:** A description of the Darian silt-loam is presented in the text. However, a review of text and the figure indicates be removed or clarified to state that the description is for the area surrounding the site.

Response #20 **Acknowledged.** A statement referring to the areas surrounding the site has been added to the text.

Comment #21 **Page 3-50, Sec. 3.2.4.2., P3:** See previous comment on the presentation of grain-size distribution curves.

Response #21 **Acknowledged.** See comment #3.

Comment #22 **Page 3-52, P2:** MW26-1 is located to the east of the site and not west, as stated in the text.

Response #22 **Acknowledged.** The text has been revised accordingly.

Comment #23 **Figure 3-15:** The 738 contour line should pass through MW26-7, which has a reported elevation of 738.00.

Response #2 **Acknowledged.** The figure has been revised accordingly.

Comment #24 **Table 3-8:** See previous comment presented for Table 3-1.

Response #24 **Acknowledged.** Please see response #8.

Comment #25 **Page 3-57, P1:** Profile identifications should be presented on Figure 3-16 for ease of reference.

Response #25 **Acknowledged.** The location of the GPR profiles are shown in Figure 2-9.

Comment #26 **Page 3-61, Sec. 3.2.6.2, P1:** The April 4, 1994 data set contains four data points and not three, as stated in the text.

Response #26 **Agreed.** The text has been revised to state that the data set contains four data points.

Comment #27 **Figure 3-20:** The 744 potentiometric contour line should pass through MW26-10, which has a reported elevation of 744.00.

Response #27 **Agreed.** The figure has been revised accordingly.

Comment #28 **Figures 3-20 through 3-22:** The contour lines shown on these figures should be truncated between data control points.

Response #28 **Disagree.** The contour lines are considered to be reasonable extrapolations based upon the data collected.

Comment #29 **Page 3-66, Sec. 3.2.6.3:** See previous comment on the presentation of the hydraulic conductivity results.

Response #29 **Acknowledged.** The average hydraulic conductivity for SEAD-26 was re-calculated using a geometric mean.

Comment #30 **Table 3-10:** See previous comment on the calculation of hydraulic conductivity averages value.

Response #30 **Acknowledged.** Please see response #29.

Comment #31 **Page 3-66, Sec. 3.2.6.4:** See previous comment on the calculations of flow velocities.

Response #31 **Acknowledged.** The groundwater velocities for SEAD-26 were recalculated using the new hydraulic conductivities based on a geometric mean.

Comment #32 **Figure 3-23 and 3-24:** These figures do not match, the discrepancy should be corrected. The arrow indicating the site in Figure 3-24 is not pointing to the site boundaries.

Response #32 **Acknowledged.** This discrepancy has been corrected.

Section 4.0

Comment #1 **Page 4-1, Sec. 4.0:** The text should clearly state that both DQO documents will be referenced in the RI Report.

Response #1 **Agreed.** The text has been modified accordingly.

Comment #2 **Figure 4-1:** There are locations on this figure which should be contoured with a 1 ppmv contour line, which have not been identified in the text as being related to non-contaminant sources.

Response # **Disagree.** A review of the data did not indicate locations that should be contoured in addtion to those shown on the figure.

Comment #3 **Table 4-5:** TAGM 4046 lists a concentration or the MDL for several compounds. In these instances, the lower of the two numbers should be used for determining which samples exceed the TAGM guidance values.

Response #3 **Acknowledged.** The soil cleanup standards listed in Table 4-5 follow the guidelines established in TAGM 4046.

Comment #4 **Table 4-7:** There is a TAGM value for 1,2-dichloroethene (trans) of 300 ug/kg. It is appropriate to use this value for 1,2-dichloroethene (total) since these compounds typically co-elute and are not differentiated by the laboratory. The use of this value should be reflected in the associated text. There is also a value for chlordane in TAGM-4046 which should be

used for comparison with alphachlordane results. The heading for the last two pages of this table has been cut-off and should be corrected.

Response #4 **Acknowledged.** The TAGM for chlordane has been added and the corrections to the heading have been made.

Comment #5 **Page 4-38, P2:** A figure showing the distribution of semi-volatile (PAHs) in soils should be presented in the RI Report.

Response #5 **Acknowledged.** A figure (Figure 4-16) showing the distribution of PAHs in soils at SEAD-25 has been added to the report.

Comment #6 **Page 4-41, P2:** It is not appropriate to discuss health-related issues in the nature and extent section. The text in this section should discuss the exceedaneces related to guidance values and leave the discussion of health risk to the health risk section.

Reponse #6 **Acknowledged.** This reference has been deleted from the text.

Comment #7 **Page 4-41, P4:** The text should state the concentrations of the samples discussed.

Response #7 **Acknowledged.** The concentrations of the samples discussed have been added to the text.

Comment #8 **Page 4-42, Sec. 4.1.5, P1:** The text should present a comparison between all three rounds of sampling, and how the groundwater chemistry has changed through time.

Response #8 **Acknowledged.** An analysis of changes or trends over time for the groundwater data was not conducted due to the limited data set, and the fact that many of the wells were not installed in earlier sampling rounds. Additionally, the statistical summary table (Table 4-9) shows that there was a 0% frequency of detection for many of the analytes, and a low frequency of detection for the remainder of the organic analytes showing a hit. The metals data may be subjected to a non-parametric type statistical trend analyis after additional sampling rounds are conducted.

Comment #9 **Table 4-9:** Please explain why the "total counts" presented in the groundwater summary table varies from method to method and within each method.

Response #9 The total counts vary under the volatile organics from compound to compound due to the use of either Method 524.1 or TCL volatile organics. The use of both methods was due to the request by EPA to include the 524.1 analysis on certain wells.

Comment #10 **Table 4-10:** The order in which the wells are presented is confusing. The wells should be presented in numerical order.

In addition to NYSDEC GA groundwater standards, Federal MCLs should also be included for each contaminant. The table incorrectly states that there are no standards for Bromoform, Antimony, Beryllium and Thallium, which all have Federal MCLs.

Response #10 **Acknowledged.** The table has been modified to include MCLs if the MCL is lower than the NYSDEC GA groundwater standard or if no GA standard exists for a compound. The order of the wells is due to the manner in which the relational database is queried to create the tables.

Comment #11 **Page 4-65, Sec. 4.1.5.2:** A figure showing the distribution of total, semi-volatiles (including TICs) should be presented in this report.

Response #11 **Acknowledged.** A figure showing the concentrations of SVOCs and TICs in the shallow groundwater from round 2 (March 1996) has been added as Figure 4-15 to the report.

Comment #12 **Page 4-66, P1:** A discussion of the TICs found in Round 2 sample analysis results should be presented.

Response #12 **Acknowledged.** A discussion of the SVOC TICs in groundwater has been added to the section

Comment #13 **Page 4-67, P1:** The text speculates about the origin of the inorganics found in the groundwater. More justification should be given for the conclusions presented here.

Response #13 **Acknowledged.** This statement has been removed from the text. A statistical analysis of background metals concentrations compared to the groundwater sampling concentrations is presented in Section 6.0.

Comment #14 **Page 4-74, P1:** The text states that SW25-6 was not used as background since it was "... impacted by other constituents, not associated with past site activities...: but the text does not elaborate what these impacts were or what caused them. A discussion of these impacts should be presented in the text.

Response #14 **Agreed.** The impacts referred to in the report are elevated levels of SVOCs, and PAHs detected in the sediment sample at this location; presumably from storm drain discharges.

Comment #15 **General Comment:** The results of the average and standard deviations should be rounded to reasonable numbers since the analytical methods cannot typically detect these compounds down to the numbers presented here.

Response #15 **Acknowledged.**

Comment #16 **Page 4-78, Sec. 4.1.7.1, P1:** Toluene is not considered a common laboratory contaminant and the discussion in the text referring to toluene as such should be removed.

Response #16 **Disagree.** Even though toluene is not as common a lab contaminant as acetone, 2-butanone and carbon disulfide, it has been shown to be an artifact from laboratory cross-contamination. Due to the low concentrations present and the fact that toluene has not been shown to be a contaminant of concern at SEDA, it is reasonable to assume that its presence is due to laboratory contamination. The text has been revised to state that the presence of these compounds may be due to laboratory cross-contamination.

Comment #17 **Table 4-14:** The source listed for Di-n-buthylphthalate is given as "????". What is this source?

Response #17 **Acknowledged.** This has been corrected to show none, meaning there are no current sediment quality criteria for this compound.

Comment #18 **Page 4-78:** Is the drainage ditch discussed here "...north..." the northwest ditch previously discussed?

Response #18 The location of the drainage ditch mentioned in this paragraph can be confirmed by the referenced sample locations.

Comment #19 **Table 4-14:** The abbreviations for the sources listed should be presented as footnotes to this table. What is the "west Effect Le" which is listed as a source? If a compound has been qualified as rejected, the concentrations should be removed from the tables and only the qualifier "R" shown.

Response #19 **Acknowledged.** The source abbreviations have been corrected and identified in the table.

Comment #20 **Page 4-86, Sec. 4.1.7.6:** The text states that MW25-2 had the maximum TPH concentration. This appears to be incorrect since this section discusses sediment sample results. The previous paragraph identifies surface water samples. Again, this appears to be incorrect in a sediment discussion.

Response #20 **Acknowledged.** The text has been changed to show the sediment location as SD25-8 rather than MW25-2 and the reference to surface water has been changed to sediment.

Comment #21 **Page 4-86, Sec. 4.1.8:** The text here should state that the site has been impacted by TPH. This section should also summarize the results of the soil gas survey and relate these results to the groundwater and soil sample results.

Response #21 **Acknowledged.** The text has been revised to include TPH. A discussion relating the soil gas survey result to the groundwater and soil sample results has been added to Sec. 4.1.8.

Comment #22 **Table 4-16 and 4-17:** Why do the "total counts" vary between some of the compounds? The asterisks represented on Table 4-17 should be added to the list of notes.

Response #22 Please see comment #9

Comment #23 **Table 4-22:** See previous comments on the variation between total counts.

There are not units presented on this table.

Response #23 Please see response #9. Units have been added to the table.

Comment #24 **Table 4-23:** The wells are not presented in numeric order, is there a significance in the way the wells are presented?

Response #24 The order that the wells appear in this table is a function of the structure of the database and the manner in which the database information is accessed.

Comment #25 **Page 4-155:** The results of all the inorganics should be discussed, especially when analytes exceed their guidance values by as much as 29,900 times, as in the case for calcium.

Response #25 **Acknowledged.** The table incorrectly showed a standard of 50 ug/l for calcium. There is no current groundwater standard for calcium. The table has been corrected to show this.

Comment #26 **Page 4-156, Sec. 4.2.41:** The text here references SEAD-25. This should be corrected to state SEAD-26.

Response #26 **Acknowledged.** The reference has been changed accordingly.

Comment #27 **Table 4-24:** See previous comment on total count variations.

Response #27 Please see response #9.

Comment #28 **Table 4-25:** See previous comment on the "standard source" as it applies to heptachlor.

Response #28 **Acknowledged.** The reference has been changed to New York State Class C Surface Water Standard.

Comment #29 **Page 4-163, Sec. 4.2.4.2:** The standard referenced here for surface waters is incorrectly given as "... New York State Class GA..."

Reponse #29 **Acknowledged.** The text has been changed to New York State Class C Surface Water Quality standards.

Comment #30 **Page 4-164, P1:** The text here references groundwater. This text should be corrected to state surface water.

Response #30 **Acknowledged.** The reference has been changed to surface water.

Comment #31 **Figure 4-14:** The flow direction of the surface water bodies should be presented to aid in interpretation of results.

Response #31 **Acknowledged.** A map showing the surface water flow direction for SEAD 26 is presented in Figure 3-14.

Comment #32 **Page 4-173, Sec. 4.2.5.3:** The text should state the concentrations of contaminants detected and not only state the number of times the contaminants exceeded their respective guidance values.

Response #32 The concentrations of pesticides and PCBs are presented in the preceding Table 4-27.

Comment #33 **Page 4-176, Sec. 4.2.5.6:** The text discusses surface soil results in a section which presents sediment results.

Response #33 **Acknowledged.** The text has been revised to sediment results.

Comment #34 **Page 4-177, Sec. 4.2.6:** Paragraph 3 states that no criteria exceedances were deteced for VOCs in groundwater at SEAD 26. The text should be corrected, as benzene and ethylbenzene were detected above NYSDEC Class GA standards.

Response #34 **Agreed.** The text has been changed to state that the NYSDEC GA standards were exceeded for benzene and ethylbenzene in two wells.

<u>Section 5.0</u>

Comment #1 The Fate and Transport chapter of this RI includes information about the physical and chemical characterstics of the site and the site contaminants. It also includes three modeling efforts (a water balance, fugacity modeling, and one dimensional tranport modeling). It does not, however,

provide clear conclusions on the potential fate and transport of contaminants at the two sites. Any conclusions concerning the sites are fragmentary and scattered throughout the section. No overall conclusions concerning the site are presented.

A number of general observations concerning the section as a whole are as follows. Most of these affect the usability of the section at the end of the chapter. This section should bring together the physical and chemical characterstics of the site and contaminants and the results from the three models. From this, a unified description of the qualitative and, if the data permit it, quantitative description of the primary fate and transport mechanisms acting on each site should be presented.

- Conclusions: The main points of the fate and transport analysis should be summarized in a conclusions section at the end of the chapter. This section should bring together the physical and chemical characteristics of the site and contaminants and the results from the three models. From this, a unified description of the qualitative and, if the data permit it, quantitative description of the primary fate and transport mechanisms acting on each site should be presented.

Response #1 **Acknowledged**. Section 8.0 presents a summary of the fate and transport analysis and the risk assessment for SEAD-25 and SEAD-26.

Comment #2 **Page 5-1, P4:** As shown on Figure 1-3, the elevated pad is <u>not</u> defined by the 742 foot contour.

Response #2 **Disagree.** The fire training pad is located within the 742 foot elevation contour according to Figure 1-3.

Comment #3 **Page 5-2, P3:** Figure 1-13 is not rainfall information. Consider restating the information, or a portion of it, in this section since it is fundamental to the analysis.

Response #3 **Agreed.** The figure reference has been corrected to Figure 1-14 and the references to rainfall have been changed to precipitation.

Comment #4 **Page 5-3, P3:** Water Balance: Why are 1975 and 1957 models and information being used? Why not use more recent models such as the HELP model. Also, what is the point of this exercise? The text states that "understanding the water balance of the site is helpful in evaluating the containmant fate and transport at SEAD-25," yet this analysis or its results are not referred to at all in the rest of the chapter.

When presenting an analysis of this type, the general methodology, assumptions and results should be presented and explained as necessary in

the text, with the details of the analysis presented in an appendix. This also applies to the modeling given in sections 5.3 and 5.4.

Response #4 **Acknowledged.** The water balance models presented are standard models that were used to estimate the amount of runoff and evapotranspiration at the site as part of the overall water budget. The results of the water balance are described at the end of section 5.1.1 for SEAD-25 and section 5.2.1 for SEAD-26. This information is presented to qualitatively and semi-quantitatively assess the potential effects of precipitation on contaminant transport in the vadose zone. Text has been added to indicate that the potential for infiltration of vadose zone contaminants is moderate since most of the water is lost to evapotranspiration or runoff. It also describes the effects on surface water flow and sediment contaminant transport. The HELP model was developed for landfill applications and is therefore not considered appropriate for these sites.

Comment #5 **Page 5-5, P4:** These assumptions concerning snowfall and snowmelt given here are gross generalizations which appear to be the direct cause of the results presented in para 2, Page 5-7.

Response #5 **Acknowledged.** The assumptions stated for snowmelt and snowfall may be somewhat conservative. The results discussed on page 5-7 merely reflect the assumptions made in the previous section.

Comment #6 **Page 5-7, P2:** See comment Page 5-5, p4 above.

Response #6 See response #5.

Comment #7 **Page 5-7, P3:** An explanation of how these results factor into the fate and transport of contaminants at the site should be given in the text.

Response #7 **Acknowledged.** Text has been added to indicate that the BTEX and VOCs in the subsurface at SEAD-25 would not be expected to migrate via this pathway.

Comment #8 **Page 5-7, P4-5:** Summary tables or figures of the analytical results should be reproduced or referenced.

Response #8 **Acknowledged.** References for the summary tables have been inserted in the text.

Comment #9 **Page 5-12, P1:** Reference the section with the discussion of the water balance.

Response #9 **Acknowledged.** A reference for the section discussing the water balance for SEAD-25 has been inserted.

Comment #10

Page 5-13, Table 5-2: This table should only include compounds which are relevant to SEAD-25 and SEAD-26. Delete any compounds which are not of concern at the site. Also, the table should not include bioconcentration factors, which are not relevant to this section, or half-life, which is highly dependent on the circumstances under which it is measured.

Response #10

Acknowledged. The table has been revised to show the list of compounds of concern that corresponds to the list of compounds shown in Table 6-4, which are the list of compounds quantified in the human health risk assessment. Bioconcentration factors and half-lifes were included as a point of discussion but were not considered relevant for this site. Therefore they have been removed from the table as requested.

Comment #11

Page 5-20, P2: The statement that VOCs degrade or decay over time conflicts with various other statements in this chapter concerning degradation of various compounds. Please clarify.

Response #11

This paragraph is meant to describe possible mechanisms affecting the fate and transport of organic chemicals in both groundwater and soils at the site. Specific discussions on the biodegradability of BTEX, chlorinated organics, and PAHs are presented later in the section. The statements made concerning the biodegradation of these specific compounds indicate that the available data on the biodegradability of benzene are contradictory and that toluene and ethylbenzene are generally considered to be biodegradable in the subsurface environment. Data concerning the biodegradability of xylenes is not readily available. Biodegradation of chlorinated organics is not considered a significant migration pathway in the subsurface under most environmental conditions, whereas PAHs , especially the lighter molecular weight compounds, are biodegradable under most environmental conditions.

Comment #12

Page 5-21, P1: It is irrelevant how many of the compounds listed in Table 5-2 will volatilize. Discussions in the text should be confined to the contaminants of interest at the site. See also the discussion of Table 5-2 at Page 13ff.

Response #12

The discussion in this paragraph is meant to be a general introduction to the concept of Henry's Law and the factors affecting volatization of organic compounds in the subsurface. More specific discussions related to the chemicals of concern at the site are presented later in the section. The reference to Table 5-2 has been removed.

Comment #13

Page 5-21, P2: General statements such as those which begin in this paragraph should be left out unless they are related to specific concerns at the site.

Response #13 As in the above response, this paragraph is a general introduction to residence times. Specific discussions concerning the compounds of concern at the site are discussed later in the section.

Comment #14 **Page 5-21, P4:** How much of the "following information" was obtained from the referenced document? This material should be properly referenced. Also, reproduction of information from a reference should be limited to that which is directly applicable to the specific site situation.

Response #14 As the paragraph states, the information in the section under aromatic volatile organics was obtained from the referenced document. This information is considered to be relevant to the site.

Comment #15 **Page 5-21, P5:** Equilibrium partitioning assesses distribution of contaminants at steady-state, it does not assess transport pathways.

Response #15 **Acknowledged.** However, the general principles of equilibrium partitioning help to determine how much of the chemical will partition in the water, soil or air phases under equilibrium conditons and thereby what transport pathway will predominate.

Comment #16 **Page 5-22, P3:** The mass of contaminants which are transported in the vapor phase is generally small compared to other modes of transport. Also, it is only minimally affected by barometric pressure. Please explain how it would be affected by convection currents.

Response #16 Convection currents result from the transfer of heat by fluid motion between regions of unequal density resulting from nonuniform heating. In the subsurface, the mass transfer of vapor phase contaminants at SEAD 25 and 26 could be affected by convection currents from the uneven heating of the ground.

Comment #17 **Page 5-22, P5:** Is the affect of salinity on the Henry's Law constant relevant to this site? If so, the reason should be stated, if not, reference to it should be deleted here and in the several other places that it occurs in this chapter.

Response #17 Sodium, manganese, and other mineral salts are present in the groundwater at the site. The concentrations present may contribute to elevated Henry's Law constants for some organic compounds. This statement has been added to the text.

Comment #18 **Page 5-22, P6:** Please explain why releases to the atmosphere and tropospheric lifetime are important factors at these sites.

Response #18 **Acknowledged.** Tropospheric lifetime is not relevent. This paragraph has been removed from the section.

Comment #19 **Page 5-23, P2:** Please clarify the third and fourth sentences "Volatilization represents...".

Response #19 Volatilization of TCE and 1,2-DCE is considered a significant migration pathway because of the relatively high vapor pressures and Henry's Law constants for these compounds. The partitioning of these compounds from groundwater to the vapor phase is directly proportional to the concentrations in groundwater. At the concentrations of TCE detected in groundwater at SEAD-25 (10 ppb average), the partitioning of this comound into the vapor phase would not be significant. The text has been revised to show that these pathways may be significant if the groundwater concentrations are sufficiently high.

Comment #20 **Page 5-23, P4:** Solubility does not "cause impacts to the groundwater". Please restate or delete. Also, what is the relevance of the state of TCE and DCE since no pure product was found?

Response #20 **Acknowledged.** This statement has been removed from the text. The physical state of TCE and DCE at room temperature is not particularly relevant to the site conditions but does provide a relative indicator and has been retained in the text for reference.

Comment #21 **Page 5-23, P5:** Vapor pressure is not relevant to fate and transport since no pure product was found. Relative humidity and barometric pressure effects on vapor pressure would be negligible in the event that pure product were present.

Response #21 **Acknowledged.** However, the vapor pressure would be relevent to these compounds in the vadose zone.

Comment #22 **Page 5-24, P3:** Please explain how "soil, sediment, and suspended particulate matter represent an important media for the transport of the chemicals."

Response #22 Soil.and sediment act as transport media through erosion and transport by surface water overland flow, infiltration and percolation of precipitation and stream flow, and suspended particulate matter through airborne transport and groundwater flow transport.

Comment #23 **Page 5-24, P5:** Provide backup for this paragraph or delete it. Both biodegradation and volatilization are generally insignificant for PAHs.

Response #23 **Acknowledged.** This paragraph has been removed.

Comment #24 **Page 5-25:** Partitioning Model of Fugacity: See Page 5-3, p 3ff comment.

Response #24 Please see response #4.

Comment #25 **Page 5-25, P1:** Why is the fugacity model for VOCs being applied to SEAD-26 when 5.2.2, Chemical Characterization, states that various appropriate limits for VOCs in different media were not exceeded.

Response #25 Fugacity modeling for VOCs at SEAD-26 will provide a better understanding of the fate and transport characteristics of the low levels of VOCs detected in soils.

Comment #26 **Page 5-39, P2:** There is no figure 5-1 showing TCE breakdown products.

Response #26 **Acknowledged.** The reference to this figure has been deleted.

Comment #27 **Page 5-34, 5-39 Fugacity model results:** The results were not related to the existing conditions on the sites. How well do the model results represent what is happening at the sites? How can this information be used to predict what will happen on the site?

Response #27 The fugacity modeling results predict the partitioning of BTEX and chlorinated solvents in groundwater and soils based upon the assumptions stated earlier in the section. This information is used to assess the degree to which the site contaminants will be available for degradation processes, the potential for migration and to assess potential exposure pathways for the human health risk assessment.

Comment #28 **Page 5-41, P2:** How does this relate to conditions at these sites?

Response #28 Based upon the information presented in this section, TCE which was found in soils and groundwater at SEAD-25 and in soils at SEAD-26, are expected to be moderately sorbed to soils (characterized as till with a high percentage of silt and clay); and that the TCE will be relatively persistent due to the absence of any significant degradation mechanisms.

Comment #29 **Page 5-42, P2,3:** How do the various items mentioned here pertain to the site? Is photochemical oxidation of TCE in air, or the half-life of TCE in water relevant?

Response #29 The paragraphs discussing photoxidation and biodegradation have been deleted from the text since the information presented is not necessarily relevant or conclusive.

Comment #30 **Page 5-42, P4:** The information in this paragraph is incorrect; there is considerable evidence in the literature to microbial biodegradation of PCE and TCE in both laboratory and field environments. What is the purpose of the statement "Biodegradation should be assumed to be of minimal importance except in landfills with active microbial populations"? This

type of statement needs to be related to the conditions at the site and backed up with further technical information.

Response #30 This paragraph has been deleted.

Comment #31 **Page 5-42 to 46, Semivolatile Organic Compounds:** A considerable amount of space is devoted to discussing the properties and possible fate and transport pathways of 2,4-dimethylphenol and naphthalene, which are the two most prevalent SVOCs on the two sites. However, there is no attempt made to identify how these properties and pathways are applicable to the sites being examined.

Response #31 Section 8.0 summarizes the fate and transport characteristics at both SEAD-25 and SEAD-26.

Comment #32 **Page 5-45, P2:** Naphthalene does not have a "relatively high aqueous solubility." Also, the conclusion in the closing statement is not supported by the beginning of the paragraph.

Response #32 **Agreed.** This paragraph has been deleted.

Comment #33 **Page 5-46, P5:** It is incorrect to say that the vadose zone does not need to be modeled with the transport model because it was already estimated within the fugacity modeling. These are entirely different models, the fugacity model being a simple steady state model of contaminant distribution, and the transport model being a time-dependent dynamic model of contaminant movement.

Response #33 **Acknowledged.** This statement has been deleted from the text.

Comment #34 **Page 5-48, Input Parameters:** The nomenclature listed does not match the formula nomenclature (English and Greek mixed, upper and lower case differences). Also, there is no justification for the values listed in Table 5-6, contrary to what the text states.

Reponse #34 **Acknowledged.** The model used in the pre-draft RI has been replaced with a more updated solute transport model (BIOSCREEN) that was not available when the pre-draft report was submitted for review. This model simulates natural attenuation and transport of dissolved hydrocarbons based upon the Domenico analytical transport model. This model is considered to be appropriate for evaluating the potential for natural biodegradation of BTEX contaminants at both SEAD-25 and SEAD-26 using some simplifying assumptions. This model is approved by the EPA and has been used at many disposal sites as a tool for detemining the no-action alternative and for identifying potential sensitive groundwater receptors.

Comment #35 **Page 5-48, P "The graphical...":** Figure 5-1 should be given as four separate figures.

Response #35 **Acknowledged.** The figures have been changed to show the results of the BIOSCREEN modeling as described above and are referenced and numbered separately.

Comment #36 **Model Output:** The actual concentration used at distance "0", 3.98 mg/l, does not correspond to Figure 4-3 which gives the concentration at the source as 3.04 mg/l.

Response #36 Please see comment #34.

Comment #37 **Page 5-49, P4:** Why is the model being run for BTEX at SEAD-26? Section 5.2.2 seems to indicate that VOCs (i.e. BTEX) are not a concern at this site.

Response #37 BTEX was detected in 2 out of 23 groundwater samples at SEAD-26. The highest concentrations of total BTEX (15 ppb) were found in MW26-7 which is at the periphery of the source area (the fire training pit). Other VOCs were also detected at low concentrations including trimethylbenzenes. Due to the low hits on VOCs at SEAD-26, the pre-draft RI stated that VOCs were not of concern. However, the presence of these compounds, even at these concentrations, requires further analysis to determine the migration potential and if they pose a potential threat to human health or the environment. Consequently, a simple solute transport model was used to determine the effects of natural attenuation at the site if no further actions or engineering controls were implemented. The BIOSCREEN model is used as a simple predictive tool to assess the relative effects of biodegradation on the VOCs in groundwater as well as the effects of dipersion and adsorbtion on solute concentrations. These results may be used to estimate the extent of plume migration over time and the time required to naturally degrade contaminant levels to regulatory cleanup requirements.

Comment #38 **Page 5-50, P1:** As with SEAD-25, it is unlikely that the conditions at SEAD-26 represent one-dimensional flow in a homogeneous, isotropic medium. Note the description of the site on Page 10, P2: "The burning pit and surrounding area is composed mostly of fill that is from 6.0 to 14.0 feet thick. On the basis of excavations performed at SEAD-26, the fill contains non-metallic construction debris and boulders as well as metallic debris (e.g., pipes, bucket, steel fragments)."

Response #38 **Acknowledged.** The site geology at SEAD-26 is composed of a mixture of fill materials and glacial till and weathered shale. The pre-draft RI describes the fill material as having a similar compostition to the till and that the contact between the two was not distinct. Hydraulic conductivities were measured in 8 monitoring wells around SEAD-26.

The geometric mean of the conductivities was used in the BIOSCREEN model to determine the seepage velocity. The hydraulic conductivities ranged from 1.5×10^{-3} to 3.9×10^{-3}. The conductivities indicate that the geology in SEAD-26 is fairly homogeneous within the confines of the area modeled. However, this geology is not considered to be representative of the geology outside the confines of SEAD-26 or other areas of SEDA as evidenced by the fairly high seepage velocity of 130 ft/yr. A discussion of the modeling for SEAD-26 using the BIOSCREEN model states that the one of the simplifying assumptions for the model is that the aquifer is homogeneous and isotropic.

Comment #39

Tranport Modeling, General Comments (see also p 5-3, p 3ff comment): This modeling effort will require much more support before it can be considered credible for predicting fate and transport on these sites. More background on the model should be provided, including its general methodology, input parameter requirements, assumption made, resulting output, model limitations, and model sensitivity. Appropriate backup should be provided for all of the input values given in Table 5-6. Consider including a generic diagram indicating what the model accomplshes and maps depicting the model output for each site.

Appendix I (ODAST Model), should be referred to in the text if it is being used to support the analysis. The equations given in the text do not correspond to the equations given in the appendix. The output graphs given in the appendix also seem to bear no relation to the information given in the text. The concentration input for BTEX at SEAD-25 given in the Appendix (3.04 mg/l) corresponds to Figure 4-3 but does not correspond to Table 5-6. (See also Model Output comment). As it stands, the information given in the appendix and the text is insufficient to determine if the model results are credible.

It is unclear what simplifications were made to the model for its application to SEAD-26. These should be more clearly stated.
The validity of the modeling effort for predicting the change in concentration with time is questionable since only one true data point is available for each site. For SEAD-25, the concentration versus time graph is generated from this single data point and an initial condition based on the results of a previous model run, and cannot be considerable reliable. For SEAD-26 the prediction is based solely on an initial concentration in one well and cannot be considered reliable.

Response #39

See response # 34.

Draft RI for the Fire Training Areas

Comments by Frye

Comment #1 Per EPA Guidance, the RI report should discuss, at a minimum, chemical-specific ARARs (scattered references to MCLs and NYS GA groundwater standards are made throughout the text). Also per EPA Guidance, an RI report should contain a conclusion/recommendation section wherein the recommendation for no-further-action or to perform a Feasibility Study is made. This recommendation is based upon the result of the risk assessment and ARARs (note, TAGMs are NOT ARARs). Include a separate section discussing chemical-specific ARARs which includes a listing of all identified chemical-specific ARARs and a comparison of each COC thereto as wells as a conclusion/recommendation section in the report.

Response #1 As required by 40 CFR Part 300.430(b)(9), project scoping for remedial investigations/reasibility studies (RI/FS), a preliminary list of ARARs and "To-Be-Considered"(TBCs) was developed and presented in the Project Scoping Plan for SEAD-25 and SEAD-26 (July 1995). These included separate tables for Location Specific ARARs, Action Specific ARARs and Chemical Specific ARARs. The data collected from the RI is compared to applicable chemical specific ARARs. It is the intention of the EPA that ARARs must be attained for any hazardous substances left on site at the completion of remedial actions and that remedial actions should also comply with ARARs. The list of ARARs will be refined and evaluated during the RI/FS process. Each ARAR identified in the Project Scoping Document will be evaluated to determine if they are applicable and relevant and appropriate based upon jurisdictional requirements (in the case of applicability) and appropriate and relevant based on a comparison of the action, location, or chemicals covered by the requirement and related conditions of the site. Only those requirements that are determined to be both relevant and appropriate must be complied with. The detailed analysis of chemical specific, action specific, and location specific ARARs is presented in the feasibility study report. Section 8 of the Draft RI provides a summary section of the results of the RI. Text has been added to provide further discussions of the chemical specific ARARs and recommendations for a feasibility study including a detailed analysis of remedial alternatives.

Comments by Bradley

Comment #1 Previous comments adequately addressed.

Response to Comments
United States Environmental Protection Agency (USEPA), December 29, 1998
Revised Draft Remedial Investigation Report for Fire Training and Demonstration Pad (SEAD 25)
and the Fire Training Pit and Area (SEAD-26)
at the
Seneca Army Depot Activity, Romulus, NY

Based on our review we believe that the BIOSCREEN model provides an estimate of the plume length and a gross estimate of the remediation time of the dissolved phase plume undergoing natural attenuation. Based on the review of the geochemical data presented it is evident that natural attenuation is occurring at the site. However, several issues concerning the natural attenuation study need to be addressed, or at least more clearly stated, in the Groundwater Contaminant Transport sections of the Remedial Investigation Report to address the uncertainties involved in the predicting the effectiveness of natural attenuation:

Comment #1 Based on the calculations provided by the BIOSCREEN model, after a period of 100 years, the source area concentration is still 1,800 ug/L, almost three to four orders of magnitude greater than the compliance concentrations of 0.7 to 5 ug/L. This would suggest that the time to reach cleanup goals by natural attenuation alone, under current site conditions, is unrealistic.

Response #1: Agreed. The time to reach the clean-up goals by natural attenuation alone, is not a realistic time frame for the site, because as mentioned above, the compliance concentrations will in all likelihood not be reached, even after 100 years. While this type of a discussion is best suited for the SEAD-25 Feasibility Study, the text has been clarified, and now it includes a statement about the expected lack of compliance under the existing site conditions. Specifically, the text now notes that the source zone concentration in the plume after 100 years (1,800 µg/L) is still well above the applicable compliance concentrations of 0.7 to 5 µg/L. The new text was added to the end of the first paragraph of the subsection titled, Predictive Simulations of Plume (page 5-54).

Comment #2 While the modeling effort provides a gross estimate of natural attenuation, the only way to document the natural attenuation process with certainty is through long-term monitoring. After a period of several years of groundwater sampling and analysis, the long-term monitoring results should show decreasing concentrations throughout the plume. To date, this is not true. For example, at SEAD-25 the benzene concentrations have more than double from 3,000 ug/L to 6,220 ug/L between sample Round 1 (Fall of 1995) and sample Round 2 (Spring of 1996). While these changes may represent seasonal fluctuations, they also represent an unstable plume indicating that the plume source area may still be active and require removal in order for the dissolved-phase portion of the plume to naturally attenuate.

Response #2 Agreed. Long term monitoring provides data that would document the natural attenuation process with relative certainty. We disagree, however, with the statement in the comment that implies that long term monitoring has been

conducted at SEAD-25, and that the existing data (Fall of 1995 and Spring of 1996) constitutes long term monitoring over which a trend in decreasing concentrations would be observed; the concentrations cited in the comment above are from the source zone of the plume. We acknowledge that the source zone concentrations will likely persists for quite some time, and that the concentrations in the source zone of the plume will likely fluctuate with seasonal changes in the water table elevation, as the water table intersects different zones of VOC-impacted soil. We also agree that source control is a necessary, and typical part of implementing monitored natural attenuation for the dissolved-phase portion of the plume. This approach is well documented by many authors, including (Wilson, 1989). Currently, monitored natural attenuation with source control/remediation is an alternative that is being evaluated for the SEAD-25 FS. However, a discussion of source control issues and remedial response alternatives is more appropriate for the SEAD-25 Feasibility Study (FS) and not the RI report. Given this, text has been added to the report that states that long term monitoring provides data that would document the natural attenuation process with relative certainty. This new text was added to the end of the subsection titled, Additional Data Supporting Biodegradation (page 5-58A).

Comment #3 The assumption of a first-order decay model may not be correct. The first-order decay model assumes that sufficient carbon and electron acceptors are available and that the microbial population is the rate limited factor. Perhaps it is likely that the best fit model is a combination of an instantaneous reaction model and a first-order decay model. The instantaneous reaction model is likely applicable to aerobic respiration and can be documented by the lack of dissolved oxygen within the plume. The instantaneous model may also be applicable to nitrification and possible iron reduction, however, as can be seen from Table 1, the role of these two processes in the natural attenuation process is very small. The first-order decay model appears to be applicable for sulfate reduction and methanogenesis, which are by far, the major processes involved with the natural attenuation process at the site. It should be noted that the sulfate and methane concentrations were not based on field data, but on data provided by BIOSCREEN and Ash Landfill Data (Table 5-6 from the RI). Also, sulfate reduction and methanogenesis may not even be occurring, since these processes occur under strongly reducing conditions (-100mV) and the redox conditions within the plume are greater than +50mV.

Response #3: Agreed. It is possible that a combination of the first-order decay model and an instantaneous reaction model represents the best fit model, given the evidence cited in the comment above. However, the model shows that the first-order decay model fits the actual site data well. For reasons cited in the comment above, it is possible that sulfate reduction and methanogenesis processes have much less impact than was initially considered for the instantaneous reaction model. New Bioscreen instantaneous reaction model runs where sulfate

reduction and methanogenesis processes are not a factor in degradation indicate that the instantaneous reaction model can be better calibrated to the data (compared to the initial model), provided the calibration includes modification of the longitudinal dispersivity value (i.e., it was adjusted up by approximately one order of magnitude). This increased the amount of mixing between hydrocarbons and electron acceptors. However, predictive model runs using this type of instantaneous reaction model input indicate that the source area concentrations would remain well above the applicable compliance concentrations (approximately 500 ug/L) after 100 years. To address this comment, the text has been clarified to include a short discussion of the possibility that the data may support instantaneous reaction model, even though the first order decay model provides the best fit. The text was clarified on page 5-54 of the transport section.

TABLE I
Assimilative capacities for SEAD-25
(Based on Table 5-6 from the RI)

Electron Acceptor/ By-Product	Concentration between background and source (mg/L)	Assimilative Capacity (mg/L)	Comments
O2	3.28	1.0	Based on Field data
N03	0.15	0.0	Based on field data
Fe(II)	4.9	0.2	No background concentration provided
S04	46.3	9.7	No field data. Data extrapolated from Ash Landfill and BIOSCREEN.
CH4	6.6	8.5	No field data. Based on BIOSCREEN data.

ARSENIC

CAS NUMBER

7440-38-2

COMMON SYNONYMS

None.

ANALYTICAL CLASSIFICATION

Inorganic.

PHYSICAL AND CHEMICAL DATA

Water Solubility: insoluble [1]
Vapor Pressure: insignificant at 25°C [1]
Henry's Law Constant: Not Applicable
Specific Gravity: 5.727 at 25/5°C [2]
Organic Carbon Partition Coefficient: NA

BACKGROUND CONCENTRATIONS

Arsenic is a naturally-occurring element. The concentration of arsenic in minimally disturbed soils varies tremendously. A collection of 1,257 soil samples from across the conterminous U.S. determined that 90 percent were less than or equal to 10 ppm, with a geometric mean of 5.2 ppm, but with a maximum value as high as 100 ppm [3].

FATE AND TRANSPORT

Elemental arsenic is extremely persistent in both water and soil. Environmental fate processes may transform one arsenic compound to another; however, arsenic itself is not degraded. Soluble forms of arsenic tend to be quite mobile in water, while less soluble species adsorb to clay or soil particles. Microorganisms in soils, sediments, and water can reduce and methylate arsenic to yield methyl arsines, which volatilize and enter the atmosphere. These forms then undergo oxidation to become methyl arsonic acids and are ultimately transformed back to inorganic arsenic [1].

Bioconcentration of arsenic occurs in aquatic organisms, primarily in algae and lower invertebrates. Biomagnification in aquatic food chains does not appear to be significant, although some fish and invertebrates contain high levels of arsenic compounds which are relatively inert toxicologically. Plants may accumulate arsenic, subject to various factors including soil arsenic concentration, plant type, and soil characteristics [1].

HUMAN TOXICITY

General. Arsenic is a long-recognized human poison capable of producing a lethal reaction and cancer. The major targets of arsenic toxicity are the respiratory system, gastrointestinal system, nervous system, hematological system and skin [1]. Studies in animals suggest that low levels of arsenic may be necessary to maintain good health, but this has not been shown in humans [1]. Arsenic is considered a weak mutagen and has been placed in weight-of-evidence cancer Group A, indicating that it is a human carcinogen [4].

Oral Exposure. A chronic oral RfD of 0.0003 mg As/kg/day is based on a NOAEL of 0.0008 mg As/kg/day for hyperpigmentation, keratosis and possible vascular complications in a chronic oral study in humans [4]. Arsenic is readily absorbed following oral exposure. Acute oral LD_{50} values of 26 mg/kg for mice and 15 to 110 mg/kg for rats are reported [1]. The fatal dose in humans is estimated to be 2 mg/kg [1]. Low-level oral exposure (> 0.01 mg As/kg/day) may cause irritation of the digestive tract, pain, nausea, vomiting, diarrhea, skin abnormalities, decreased production of blood cells, abnormal heart function, blood-vessel damage, liver damage, kidney damage, and impaired nerve function ("pins and needles" sensation). In animal studies, high doses of arsenic (> 14 mg As/kg/day) have resulted in effects on the developing fetus. These effects have not been observed in humans [1]. In humans, chronic, oral exposure to low doses of arsenic (> 0.01 mg As/kg/day) has been shown to cause cancer of the skin, liver, bladder, and lung. The most characteristic effect of long-term oral exposure to arsenic is a darkening of the torso and the appearance of small "corns" or "warts" on the palms, soles and torso. These "corns" or "warts" may develop into skin cancer [1]. An oral slope factor of 1.5 $(mg/kg/day)^{-1}$ has been adopted by the USEPA [4]. The slope factor is based on the increased incidence of skin cancer in humans exposed to arsenic in the drinking water.

Inhalation Exposure. An inhalation RfC is not available for inorganic arsenic [4]. Approximately 40% of an inhaled concentration of arsenic is absorbed [1]. Inhalation of arsenic has not been reported to be fatal in humans, and acute inhalation LC_{50} values are not available [1]. Inhalation of arsenic at concentrations greater than 0.1 mg As/m^3 may result in irritation of the nose and throat, leading to laryngitis, bronchitis or rhinitis [1]. Effects on the skin, nervous system, and gastrointestinal system similar to those found following oral exposure have been observed in humans following inhalation exposure. Of much greater concern, however, is that inhaled arsenic has been found to increase the risk of lung cancer in humans [1]. An inhalation Unit Risk of 0.0043 $(ug\ As/m^3)^{-1}$ was derived by USEPA [4] based on the increased incidence of lung cancer in occupationally exposed workers. Several epidemiology studies have suggested an association between arsenic inhalation and an increased risk of developmental effects (congenital

malformations, low birth weight, spontaneous abortion) [1]. Studies in animals support the view that arsenic is a developmental toxicant, but only at high doses (20 mg/m^3) [1].

Dermal Exposure. Arsenic has not been reported to be fatal following dermal contact [1]. Dermal contact with arsenic may result in mild to severe irritation of the skin and mucous membranes and could lead to dermal sensitization [1].

ECOLOGICAL TOXICITY

General. Arsenic is a relatively common element that is present in air, water, soil, plants, and all living tissues. At comparatively low doses, arsenic stimulates growth and development in various species of plants and animals [5]. Arsenic exists in the trivalent (III) and pentavalent (V) states, and its compounds may be either organic or inorganic [6]. Inorganic arsenic compounds are more toxic than organic compounds [5]. Background concentrations of arsenic in unpolluted river waters and soils in the United States are usually <5 µg/L and <15 mg/kg dry weight, respectively [5]. Arsenic is bioconcentrated by organisms, but does not biomagnify in the food chain.

Vegetation. There is no evidence that arsenic is essential for plant growth [7]. Elemental arsenic is considered to be relatively nontoxic to plants [8]. In plants, arsenic concentrations vary between 0.01 and 1.0 ppm. Plants grown in soils contaminated with arsenic do not show higher concentrations of this element than plants grown on uncontaminated soil [7]. In cases of arsenic toxicity, the roots are usually severely affected and plant growth is limited before large amounts of arsenic are absorbed and translocated [8]. Arsenic in soils is most toxic to plants at the seedling stage where it limits germination and reduces viability [7]. The concentration of arsenic that is toxic to plants was determined to be >10 ppm by the National Academy of Sciences [9].

Aquatic Life. Arsenic is toxic to aquatic organisms within the range of 1.0 to 45.0 mg/L arsenite, which is considered more toxic than arsenate [8]. Arsenic is extremely mobile in the aquatic environment, and its fate depends largely on prevailing pH and Eh conditions [10]. Normal arsenic concentrations in fish are 0.52 ppm for bluegill and 0.14 to 1.95 ppm for minnows [9].

Arsenic can bioaccumulate in aquatic vertebrates and invertebrates from water and food, but concentration factors are relatively low [5,11]. The BCF of inorganic arsenic in most invertebrates and fish exposed for 21 to 30 days did not exceed 17 [5]. The biological half-lives of arsenic in green sunfish and bluegills are 7 days and 1 day, respectively [11]. The lethal threshold of arsenic for minnows has been reported to be 234 mg/L [6]. Micromedex, Inc. [12] reported the 36-hour toxic value for minnows was 11.6 ppm and the 16-hour toxic value was 60 ppm.

The USEPA acute freshwater criterion for arsenic (V) is 850 µg/L and because there is insufficient data to develop the criteria, the value presented is the LOEL. The acute freshwater criterion for arsenic (III) is 360 µg/L, and the chronic freshwater criterion for the trivalent form is 190 µg/L [13]. The Ohio chronic aquatic life water quality criterion for arsenic is 190 µg/L based on warmwater and modified warmwater habitats [14].

Wildlife. Chronic poisoning is infrequently seen in most animals because detoxication and excretion are rapid [5]. Normal arsenic concentrations in mice are 1.0 ppm, while hawks typically have body burdens of 0.4 ppm [9]. Adverse effects were noted in mammals at single oral doses of 2.5 to 33 mg/kg body weight and at chronic oral doses of 1 to 10 mg/kg body weight [5]. Acute waterfowl toxicity is reported at 0.05 ppm [12]. Median lethal concentrations in the diets of mallards were reported at 5,000 ppm [15]. The oral LD_{50} values are 15 mg/kg body weight for rats, 25 to 47 mg/kg body weight for mice, 4 to 19 mg/kg body weight for rabbits, and 6.5 mg/kg body weight for fowl [12]. Arsenic does not accumulate in mammals [8].

BENZENE

CAS NUMBER

71-43-2

COMMON SYNONYMS

None.

ANALYTICAL CLASSIFICATION

Volatile organic.

PHYSICAL AND CHEMICAL DATA

Water Solubility: 1,791 mg/L [1]
Vapor Pressure: 95.19 mm Hg at 25°C [1]
Henry's Law Constant: 5.43 x 10^{-3} atm-m^3/mole (temperature not given) [1]
Specific Gravity: 0.879 at 15/5°C [2]
Organic Carbon Partition Coefficient: 31 - 143 [1]

FATE DATA: HALF-LIVES

Soil: 5 - 16 days [3]
Air: 2.09 - 20.9 days [3]
Surface Water: 5 - 16 days [3]
Groundwater: 10 days to 2 years [3]

NATURAL SOURCES

Crude oil, volcanoes, forest fires, plants [1].

ARTIFICIAL SOURCES

Gasoline, fuel oils, chemical industry, coke ovens, mining, manufacturing, cigarette smoke [1].

FATE AND TRANSPORT

Benzene will rapidly volatilize from surface soil and water. That which does not volatilize from permeable surface and subsurface soils will be highly to very highly mobile, and can be expected to leach to nearby groundwater which is not protected by a confining layer. It is fairly soluble, and will be carried with the groundwater to discharge points. It may be subject to biodegradation in soils, shallow groundwater, and surface water. Benzene will not be expected to significantly adsorb to sediment, bioconcentrate in aquatic organisms, or hydrolyze. Photodegradation may be a

significant removal mechanism in surface waters which are not conducive to microbial degradation. Benzene will undergo significant photodegradation in air, but may be washed out with rain [1].

HUMAN TOXICITY

General. Benzene is absorbed into the body following ingestion, inhalation, and dermal contact, and must undergo metabolic transformation to exert its toxic effects. Metabolism occurs primarily in the liver, and to a lesser extent in the bone marrow [4]. The primary targets of benzene toxicity are the central nervous system and the blood [4,5]. Benzene is genotoxic to humans and the USEPA has placed it in weight-of-evidence cancer Group A, indicating that it is a human carcinogen [6].

Oral Exposure. A chronic oral RfD for benzene is currently under review by the USEPA [6]. Benzene is readily absorbed following oral exposure. The lowest reported fatal dose in humans is 50 mg/kg [5]. Acute oral LD_{50} values in animals include 930 to 5600 mg/kg in rats, 2000 mg/kg in dogs and 4700 mg/kg in mice [4,5]. Data regarding the ingestion of benzene in humans are limited to acute overexposure. Ingestion of 2 ml (29 mg/kg) has resulted in depression of the central nervous system, while ingestion of 10 ml (143 mg/kg) has been fatal [5]. The cause of death was usually respiratory arrest, central nervous system depression or cardiac collapse [4]. In animals, longer-term oral exposure has resulted in toxic effects on the blood (cytopenia: decrease in various cellular elements of the blood) and the immunological system (decreased white blood cells) [4]. There is no evidence that oral exposure to benzene causes effects on reproduction and development, but studies in animals suggest that benzene may affect fetal development [4]. There is no information regarding carcinogenic effects in humans following oral exposure to benzene, but studies in animals indicate that benzene ingestion causes cancer in various regions of the body [4]. An oral Slope Factor of 0.029 $(mg/kg/day)^{-1}$ is based on an increase in the incidence of leukemia in occupationally-exposed workers [6]. The oral Slope Factor was extrapolated from the inhalation data.

Inhalation Exposure. A chronic inhalation RfC for benzene is currently under review by the USEPA [6]. Benzene is readily absorbed following inhalation exposure. The lowest reported fatal concentration in humans is 6380 mg/m^3 for a 5 minute exposure [5]. Acute inhalation LC_{50} values in rats ranged from 10,000 ppm for 7 hours to 13,700 ppm for 4 hours [4,5]. Most of the available data regarding benzene exposure involve workers exposed in the workplace. The acute effects of benzene exposure involve the central nervous system. Brief exposure to concentrations of 700 to 3000 ppm can cause drowsiness, dizziness, headaches and unconsciousness, and exposure to

concentrations of 10,000 to 20,000 ppm can result in death [4]. In most cases, the effects will end when exposure ceases. The hematopoietic system is the primary target of toxicity following long-term exposure: exposure for several months to years results in pancytopenia (reduction in red blood cells, platelets and white blood cells), while continued exposure for many years results in anemia or leukemia. The lowest concentration resulting in the hematological effects is approximately 10 to 50 ppm [5]. Benzene has been shown to cause chromosomal aberrations in bone marrow and lymphocytes in workers exposed to concentrations > 100 ppm [5]. Chromosomal damage has been found in animals at concentrations as low as 1 ppm [5]. Benzene is not known to be teratogenic (cause birth defects) in humans, but has been found to cause various problems in the developing fetus of animals (low birth weight, delayed bone formation) [4,5]. Occupational exposure to benzene has resulted in leukemia in exposed workers [4,5]. An inhalation Unit Risk of 8.3×10^{-6} $(ug/m^3)^{-1}$ is based on the incidence of leukemia in occupationally-exposed workers [6].

Dermal Exposure. Dermal exposure to benzene may cause redness and dermatitis [4,5]. Systemic effects have not been reported following dermal exposure to benzene.

1,1-DICHLOROETHENE

CAS NUMBER

75-35-4

COMMON SYNONYMS

1,1-Dichloroethylene, asym-dichloroethylene, vinylidene chloride, DCE.

ANALYTICAL CLASSIFICATION

Volatile organic.

PHYSICAL AND CHEMICAL DATA

Water Solubility: approximately 2,500 mg/L at 25°C [1]
Vapor Pressure: 591 mm Hg at 25°C [1]
Henry's Law Constant: 3.01 x 10^{-2} atm-m^3/mole [1]
Specific Gravity: 1.213 at 20/4°C [2]
Organic Carbon Partition Coefficient: 150 [1]

FATE DATA: HALF-LIVES

Soil: 4 weeks to 6 months [3]
Air: 9.9 hours to 4.1 days [3]
Surface Water: 4 weeks to 6 months [3]
Groundwater: 56 to 132 days [3]

NATURAL SOURCES

None [4].

ARTIFICIAL SOURCES

Manufacture of plastic wrap, adhesives, and synthetic fibers; metabolism of chlorinated solvents [1].

FATE AND TRANSPORT

1,1-Dichloroethene is a relatively volatile and soluble compound. Releases of this compound to soils and waters, therefore, will be lost primarily through evaporative processes. Given the low K_{oc} value, little tendency to adsorb to soils and sediments/suspended solids (in waters) is exhibited, and some percolation through soils to groundwaters can be expected. In the groundwaters, very slow hydrolysis and biodegradation (via anaerobic reductive dechlorination to vinyl chloride) will occur. Released to the atmosphere, 1,1-dichloroethene will degrade by reaction with hydroxyl

radicals. Photooxidative reactions in waters are insignificant. Based on its low octanol/water partition coefficient (K_{ow} = 135), no significant bioconcentration is expected [1].

HUMAN TOXICITY

General. High levels of DCE have reportedly caused a variety of adverse health effects in animals, including liver, kidney, heart and lung damage, as well as nervous system disorders and death. Harmful effects on the developing fetus have also been demonstrated [4]. The USEPA has placed DCE in weight-of-evidence Group C, indicating that it is a possible human carcinogen [5].

Oral Exposure. A chronic RfD of 0.009 mg/kg/day is based on a LOAEL of 9 mg/kg/day determined for hepatic lesions following chronic oral administration to rats [5]. Studies in animals have demonstrated that DCE is rapidly and almost completely absorbed from the gastrointestinal tract following oral administration. The oral LD_{50} for rats is approximately 1,500 mg/kg. No information on the health effects in humans following oral exposure was located [4]. An oral slope factor of 0.6 $(mg/kg/day)^{-1}$ is based on adrenal pheochromocytomas observed in male rats following chronic oral exposure [5].

Inhalation Exposure. The RfC is currently under review by the USEPA [5], and no value is provided in HEAST [6]. Studies in animals have demonstrated that DCE is rapidly absorbed following inhalation exposure. The 4-hour LC_{50} values in fed male rats range from approximately 6,000 to 8,000 ppm, while the 4-hour LC_{50} for male rats fasted for 16 hours is 400 ppm. No information was located regarding human deaths following inhalation exposure. The limited information available indicates that humans exposed via short-term inhalation may experience neurotoxicity. Also in humans, DCE has been implicated in liver and kidney toxicity following repeated, low-level exposure. Symptoms in humans exposed via inhalation to concentrations of about 4,000 ppm include: central nervous system depression, convulsions, spasms, and unconsciousness. Pregnant mice exposed to 15 ppm or greater DCE for an unspecified duration produced offspring with skeletal anomalies [4]. An inhalation unit risk of 5.0×10^{-5} $(\mu g/m^3)^{-1}$ is based on kidney adenocarcinomas observed in male mice exposed via inhalation for 12 months [5].

Dermal Exposure. DCE is irritating when applied to the skin of humans and animals. It is also an eye irritant in humans. Studies with mice indicate that DCE applied dermally is a tumor initiator. No other information was located regarding the health effects of DCE following dermal exposure [4].

ETHYLBENZENE

CAS NUMBER

100-41-4

COMMON SYNONYMS

None noted.

ANALYTICAL CLASSIFICATION

Volatile organic.

PHYSICAL AND CHEMICAL DATA

Water Solubility: 161 mg/L at 25°C [1]
Vapor Pressure: 9.53 mm Hg at 25°C [1]
Henry's Law Constant: 8.44 x 10^{-3} atm-m^3/mole at 25°C [2]
Specific Gravity: 0.87 at 25/25°C [3]
Organic Carbon Partition Coefficient: 871 [1]

FATE DATA: HALF-LIVES

Soil: 3 to 10 days [4]
Air: 8.56 hours to 3.57 days [4]
Surface Water: 3 to 10 days [4]
Groundwater: 6 to 228 days [4]

NATURAL SOURCES

Coal tar and petroleum [2].

ARTIFICIAL SOURCES

Manufacture of styrene, solvent, petroleum refining, vaporization/spills of gasoline and diesel fuel, auto emissions, paints, inks, insecticides, and cigarette smoke [1,2,3]

FATE AND TRANSPORT

Ethylbenzene released to surface soils will probably undergo partial volatilization and, given its limited ability to sorb to soils (K_{oc} = 871), leaching to groundwater. Evidence suggests that this material undergoes biodegradation in groundwaters, and may do so in soils if the initial loading doesn't prove toxic to soil-based microorganisms. If released to surface waters, ethylbenzene is expected to volatilize fairly readily. As with groundwaters, rapid biodegradation can be predicted after an initial acclimation period. Ethylbenzene shows only a slight to moderate tendency to adsorb to soils and sediments in waters.

Bioconcentration in aquatic organisms is not expected to be significant (BCF for ethylbenzene = 145). Ethylbenzene is expected to exist in the atmosphere primarily as a vapor, based upon its vapor pressure value (9.53 mm Hg). Principally, ethylbenzene will be removed from the atmosphere via reaction with hydroxyl radicals; some washout via rainfall may be expected. [1]

HUMAN TOXICITY

General. Humans exposed to ethylbenzene may experience eye and throat irritation, decreased movement, and dizziness. Studies in animals have shown liver and kidney damage, nervous system changes, and blood changes [2]. The USEPA has placed ethylbenzene in weight-of-evidence Group D, indicating that it is not classifiable as to human carcinogenicity [5].

Oral Exposure. A chronic RfD of 0.1 mg/kg/day is based on a NOEL of 97.1 mg/kg/day and a LOAEL of 291 mg/kg/day determined for liver and kidney toxicity in a rat subchronic to chronic oral bioassay [5]. Studies in animals revealed that ethylbenzene is quickly and effectively absorbed following oral exposure. The oral (gavage) LD_{50} in rats is reported to be 4,728 mg/kg. No information was located regarding death or health effects in humans following oral exposure [2].

Inhalation Exposure. The RfC of 1 mg/m^3 is based on a NOAEL of 434 mg/m^3 determined for developmental toxicity in rats and rabbits exposed via inhalation [5]. Ethylbenzene is rapidly and efficiently absorbed via inhalation in humans and animals. A 4-hour LC_{50} of 4,000 ppm was reported for rats. Exposure-related adverse effects in animals included those to liver and kidney, eye irritation, profuse lacrimation, CNS depression and ataxia. No deaths were reported for humans following inhalation of ethylbenzene. The effects observed in humans included pulmonary and ocular irritation, profuse lacrimation, chest constriction, dizziness, vertigo, and possible hematological alterations. Exposure of pregnant rats to levels above 138 ppm for 24 hours/day for 9 days had adverse developmental effects [2].

Dermal Exposure. Liquid ethylbenzene is rapidly absorbed through the skin; however, absorption of vapors through the skin is minimal. The dermal LD_{50} in rabbits for liquid ethylbenzene was reportedly 15,415 mg/kg. Ethylbenzene appears to be a slight eye irritant in rabbits [2].

POLYCYCLIC AROMATIC HYDROCARBONS

GENERAL

Polycyclic aromatic hydrocarbons (PAHs) are a large group of chemicals formed during the incomplete combustion of organic materials. There are over one hundred PAHs, and they are found throughout the environment in air, water, and soil. Seven of the 15 PAHs addressed in this profile are classified as probable human carcinogens [1,2].

Semivolatile organic.

PHYSICAL AND CHEMICAL DATA

Water Solubility: insoluble to 3.93 mg/L [1]
Vapor Pressure: negligible to very low at 25°C [1]
Henry's Law Constant: 6.95×10^{-8} to 1.45×10^{-3} atm-m^3/mole [1]
Specific Gravity: approximately 0.9 to 1.4 at 0 to 27°C [1]
Organic Carbon Partition Coefficient (K_{oc}): 2.5×10^3 to 5.5×10^6 [1]

FATE DATA: HALF-LIVES

Soil: 12.3 days to 5.86 years [3]
Air: 0.191 hours to 2.8 days [3]
Surface Water: 0.37 hours to 1.78 years [3]
Groundwater: 24.6 days to 10.4 years [3]

NATURAL SOURCES

Volcanoes, forest fires, crude oil, and oil shale [1].
