D-5	U-234	fish	1.000E+01	1.000E+01	BIOFAC(81)
D-5	U-234	crustacea and mollusks	6.000E+01	6.000E+01	BIOFAC(82)

#For DCF1(xxx) only factors are for infinite depth & area. See ETFG table in Ground Pathway of Detailed Report.
*Base Case means Default.Lib w/o Associate Nuclide contributions.

Summary : Residual Dose and Risk Assessment for SEAD 12 Under Residential Receptor Scenar
File : C:\USERS\MRAHMAN\DOCUMENTS\OLD RESRAD FILES\SEAD 12 PIT C-RESIDENT.RAD

Site-Specific Parameter Summary

Menu	Parameter		User Input	Default	Used by RESRAD (If different from user input)	Parameter Name
R011	Area of contaminated zone (m**2)		8.404E+03	1.000E+04	---	AREA
R011	Thickness of contaminated zone (m)		1.500E-01	2.000E+00	---	THICK0
R011	Fraction of contamination that is submerged		0.000E+00	0.000E+00	---	SUBMFRACT
R011	Length parallel to aquifer flow (m)		9.200E+01	1.000E+02	---	LCZPAQ
R011	Basic radiation dose limit (mrem/yr)		2.500E+01	3.000E+01	---	BRDL
R011	Time since placement of material (yr)		0.000E+00	0.000E+00	---	TI
R011	Times for calculations (yr)		1.000E+00	1.000E+00	---	T(2)
R011	Times for calculations (yr)		1.700E+00	3.000E+00	---	T(3)
R011	Times for calculations (yr)		3.000E+00	1.000E+01	---	T(4)
R011	Times for calculations (yr)		1.000E+01	3.000E+01	---	T(5)
R011	Times for calculations (yr)		3.000E+01	1.000E+02	---	T(6)
R011	Times for calculations (yr)		1.000E+02	3.000E+02	---	T(7)
R011	Times for calculations (yr)		3.000E+02	1.000E+03	---	T(8)
R011	Times for calculations (yr)		1.000E+03	0.000E+00	---	T(9)
R011	Times for calculations (yr)		not used	0.000E+00	---	T(10)
R012	Initial principal radionuclide (pCi/g):	Cs-137	1.000E+00	0.000E+00	---	S1(1)
R012	Initial principal radionuclide (pCi/g):	H-3	1.000E+00	0.000E+00	---	S1(2)
R012	Initial principal radionuclide (pCi/g):	Pb-210	1.000E+00	0.000E+00	---	S1(3)
R012	Initial principal radionuclide (pCi/g):	Ra-226	1.000E+00	0.000E+00	---	S1(4)
R012	Initial principal radionuclide (pCi/g):	Ra-228	1.000E+00	0.000E+00	---	S1(5)
R012	Initial principal radionuclide (pCi/g):	Th-230	1.000E+00	0.000E+00	---	S1(7)
R012	Initial principal radionuclide (pCi/g):	U-234	1.000E+00	0.000E+00	---	S1(8)
R012	Concentration in groundwater (pCi/L):	Cs-137	not used	0.000E+00	---	W1(1)
R012	Concentration in groundwater (pCi/L):	H-3	not used	0.000E+00	---	W1(2)
R012	Concentration in groundwater (pCi/L):	Pb-210	not used	0.000E+00	---	W1(3)
R012	Concentration in groundwater (pCi/L):	Ra-226	not used	0.000E+00	---	W1(4)
R012	Concentration in groundwater (pCi/L):	Ra-228	not used	0.000E+00	---	W1(5)
R012	Concentration in groundwater (pCi/L):	Th-230	not used	0.000E+00	---	W1(7)
R012	Concentration in groundwater (pCi/L):	U-234	not used	0.000E+00	---	W1(8)
R013	Cover depth (m)		0.000E+00	0.000E+00	---	COVER0
R013	Density of cover material (g/cm**3)		not used	1.500E+00	---	DENSCV
R013	Cover depth erosion rate (m/yr)		not used	1.000E-03	---	VCV
R013	Density of contaminated zone (g/cm**3)		1.280E+00	1.500E+00	---	DENSCZ
R013	Contaminated zone erosion rate (m/yr)		6.000E-04	1.000E-03	---	VCZ
R013	Contaminated zone total porosity		3.700E-01	4.000E-01	---	TPCZ
R013	Contaminated zone field capacity		6.000E-02	2.000E-01	---	FCCZ
R013	Contaminated zone hydraulic conductivity (m/yr)		2.900E+01	1.000E+01	---	HCCZ
R013	Contaminated zone b parameter		7.750E+00	5.300E+00	---	BCZ
R013	Average annual wind speed (m/sec)		3.000E+00	2.000E+00	---	WIND
R013	Humidity in air (g/m**3)		6.600E+00	8.000E+00	---	HUMID

R013	Evapotranspiration coefficient	7.000E-01	5.000E-01	---	EVAPTR
R013	Precipitation (m/yr)	7.500E-01	1.000E+00	---	PRECIP
R013	Irrigation (m/yr)	0.000E+00	2.000E-01	---	RI
R013	Irrigation mode	overhead	overhead	---	IDITCH
R013	Runoff coefficient	2.000E-01	2.000E-01	---	RUNOFF
R013	Watershed area for nearby stream or pond (m**2)	1.300E+07	1.000E+06	---	WAREA
R013	Accuracy for water/soil computations	1.000E-03	1.000E-03	---	EPS

Site-Specific Parameter Summary (continued)

Menu	Parameter	User Input	Default	Used by RESRAD (If different from user input)	Parameter Name
R014	Density of saturated zone (g/cm**3)	1.500E+00	1.500E+00	---	DENSAQ
R014	Saturated zone total porosity	3.700E-01	4.000E-01	---	TPSZ
R014	Saturated zone effective porosity	1.750E-01	2.000E-01	---	EPSZ
R014	Saturated zone field capacity	2.000E-01	2.000E-01	---	FCSZ
R014	Saturated zone hydraulic conductivity (m/yr)	2.900E+02	1.000E+02	---	HCSZ
R014	Saturated zone hydraulic gradient	1.100E-02	2.000E-02	---	HGWT
R014	Saturated zone b parameter	not used	5.300E+00	---	BSZ
R014	Water table drop rate (m/yr)	0.000E+00	1.000E-03	---	VWT
R014	Well pump intake depth (m below water table)	3.000E+00	1.000E+01	---	DWIBWT
R014	Model: Nondispersion (ND) or Mass-Balance (MB)	ND	ND	---	MODEL
R014	Well pumping rate (m**3/yr)	5.000E+01	2.500E+02	---	UW
R015	Number of unsaturated zone strata	1	1	---	NS
R015	Unsat. zone 1 thickness (m)	1.000E+00	4.000E+00	---	H(1)
R015	Unsat. zone 1 soil density (g/cm**3)	1.500E+00	1.500E+00	---	DENSUZ(1)
R015	Unsat. zone 1 total porosity	3.700E-01	4.000E-01	---	TPUZ(1)
R015	Unsat. zone 1 effective porosity	1.750E-01	2.000E-01	---	EPUZ(1)
R015	Unsat. zone 1 field capacity	2.000E-01	2.000E-01	---	FCUZ(1)
R015	Unsat. zone 1 soil-specific b parameter	7.750E+00	5.300E+00	---	BUZ(1)
R015	Unsat. zone 1 hydraulic conductivity (m/yr)	2.900E+01	1.000E+01	---	HCUZ(1)
R016	Distribution coefficients for Cs-137				
R016	Contaminated zone (cm**3/g)	1.900E+03	4.600E+03	---	DCNUCC(1)
R016	Unsaturated zone 1 (cm**3/g)	1.900E+03	4.600E+03	---	DCNUCU(11)
R016	Saturated zone (cm**3/g)	1.900E+03	4.600E+03	---	DCNUCS(1)

Statement of Certification

MJW Technical Sevices, Inc certifies that the above instrument has been calibrated by standards traceable to the National Institute of Standards and Technology, or to the calibration facilities of other International Standards organization members, or have been derived from accepted values of natural physical constants or have been derived by the ratio type of calibration techniques. The calibration system conforms to the requirements of ISO/IEC 17025 and ANSI N323. The Instrument listed above was inspected prior to shipment and it met all the manufacturer's published operating specifications. (MJW technical Services is not responsible for damage incurred during shipment or use of this instrument).

Comments

Ref. Voltage1: 500 V Ref. Voltage2: 1500 V

Inst. Voltage1: 500 V Inst. Voltage 2: 1500 V

Amplifier gain: 25

Window status: Beta threshold - 4 mV
Beta window - 50 mV
Alpha threshold - 175 mV

Instrument Voltage set @ 820V = 3.30 on High Voltage dial

Alpha background is 0 cpm, Beta background is 44 cpm

Alpha crosstalk in the Beta channel is <10% with insert in place

Beta crosstalk in the Alpha channel is <1% with insert in place

4 pi Efficiency

Pu239 = 40.9%

C14 = 2.90% (2pi = 10.8%)

SrY90 = 34.4%

Th230 = 39.7%

Tc99 = 16.0% (2pi = 31.9%)

Statement of Certification

MJW Technical Sevices, Inc certifies that the above instrument has been calibrated by standards traceable to the National Institute of Standards and Technology, or to the calibration facilities of other International Standards organization members, or have been derived from accepted values of natural physical constants or have been derived by the ratio type of calibration techniques. The calibration system conforms to the requirements of ANS/NCSL Z540-1-1994 and ANSI N323. The instrument listed above was inspected prior to shipment and it met all the manufacturer's published operating specifications. (MJW technical Services is not responsible for damage incurred during shipment or use of this instrument).

SAMPLE RECEIPT & REVIEW FORM

Client: Parsons	**SDG/ARCOC/Work Order:** 238774
Received By: RMS	**Date Received:** 10/8/09

Suspected Hazard Information	**Yes**	**No**	*If Counts > x2 area background on samples not marked "radioactive", contact the Radiation Safety Group of further investigation.
COC/Samples marked as radioactive?		✓	Maximum Counts Observed*:
Classified Radioactive II or III by RSO?		✓	
COC/Samples marked containing PCBs?		✓	
Shipped as a DOT Hazardous?		✓	Hazard Class Shipped: UN#:
Samples identified as Foreign Soil?		✓	

	Sample Receipt Criteria	**Yes**	**NA**	**No**	**Comments/Qualifiers (Required for Non-Conforming Items)**
1	Shipping containers received intact and sealed?	✓			Circle Applicable: seals broken damaged container leaking container other (describe)
2	Samples requiring cold preservation within 0 ≤ 6 deg. C?			✓	Preservation Method: (ice bags) blue ice dry ice none other (describe) see below
3	Chain of custody documents included with shipment?	✓			
4	Sample containers intact and sealed?	✓			Circle Applicable: seals broken damaged container leaking container other (describe)
5	Samples requiring chemical preservation at proper pH?	✓			Sample ID's, containers affected and observed pH: If Preservation added, Lot#:
6	VOA vials free of headspace (defined as < 6mm bubble)?		✓		Sample ID's and containers affected:
7	Are Encore containers present?			✓	(If yes, immediately deliver to Volatiles laboratory)
8	Samples received within holding time?	✓			Id's and tests affected:
9	Sample ID's on COC match ID's on bottles?	✓			Sample ID's and containers affected:
10	Date & time on COC match date & time on bottles?	✓			Sample ID's affected:
11	Number of containers received match number indicated on COC?			✓	Sample ID's affected: received only 1 container for ID's: S12ExF1-J-2-02
12	COC form is properly signed in relinquished/received sections?	✓			received 5 containers for S12ExSW-1-2-03 S12ExPr-I-2-02 " " -2-02

Comments:

received 3 coolers (1) for radchem (2) soils cooler (1) cooler came on ice (1) came w/out ice.

Fx: 7955 0469 2175 @ 19°C - radchem
8703 1343 4451 @ 17°C - soil
7955 0469 2186 @ 3°C - soil - metals, PCB, etc. ↑COC.

APPENDIX F

SAMPLE DELIVERY GROUP CASE NARRATIVES

(This page has been intentionally left blank)

COLUMBIA ANALYTICAL SERVICES, INC.

Client: Parsons Engineering Science
Project: SEAD-12
Sample Matrix: Soil

Service Request No.: R0904203
Date Received: 7/29/09

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

Three soil samples were sampled on 7/29/09 and received at CAS on 7/29/09 at cooler temperatures of 2 - 12 °C. Otherwise, the samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory.

VOLATILE ORGANICS

Twenty-six soil samples and one Trip blank were analyzed for the TCL list of Volatile Organics by SW-846 method 8260B. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The matrix spike/matrix spike duplicate analyses were performed on samples S12EXFL-I-3-01 and S12EXPR-B-2-01, as requested. Several matrix spike and matrix duplicate recoveries were outside QC limits of 70 – 130% and have been flagged with an "*". All these spikes were less than 70 % but greater than 60 %. The Acetone MS/MSD recoveries were greater than 300 % indicating the Acetone was being produced after the addition of the matrix spiking solution.

The Method Blanks associated with these samples were free of contamination except a low level "J" flagged value for Acetone in the lab blanks from 7/31/09, 8/03/09, and 8/05/09. Any associated Acetone detected in the samples within 5X these values has been flagged with a "B" accordingly.

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

Twenty-six soil samples were analyzed for the TCL List Semivolatiles by method 8270C from SW-846. All results between the PQL and MDL are flagged with a "J", as estimated.

All Tuning criteria for DFTPP were within QC limits.

All the initial and continuing calibration criteria were met for all analytes.

All Internal Standard Areas were within QC limits.

All surrogate standard recoveries were within acceptance limits

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits except for a few that were slightly above limits. No data was affected. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on samples S12EXFL-I-3-01 and S12EXPR-B-2-01, as requested. All matrix spike and matrix duplicate recoveries were within QC limits.

The Laboratory Blanks associated with these samples were free of contamination.

No other QC or analytical problems were encountered.

PESTICIDE/PCB ANALYSIS

Twenty-six soil samples were analyzed for the TCL List of Pesticides by method 8081A from SW-846 and PCB's by method 8082 from SW-846.

All the initial and continuing calibration criteria were met for all analytes.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on samples S12EXFL-I-3-01 and S12EXPR-B-2-01, as requested. All matrix spike and matrix duplicate recoveries were within QC limits.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

INORGANIC ANALYSIS

Twenty-six soil samples were analyzed for the TAL list of Metals using SW-846 methods 6010C/7471 and Total Cyanide by SW-846 meth0d 9012A.

All Blank spike (LCS) recoveries were within limits. The CRDL was within QC limits for all metals.

The matrix spike and duplicate analyses was performed on samples S12EXFL-I-3-01 and S12EXPR-B-2-01, as requested. All Matrix Spike Recoveries were within QC limits of 75 – 125 % except Antimony (71 %) on sample S12EXFL-I-3-01 and Antimony ((65 %) and Potassium on sample S12EXPR-B-2-01. The recoveries and the appropriate data have been flagged with an "N". The recovery for Aluminum, Calcium, Iron, Manganese, and Magnesium could not be accurately determined due to the amount of analyte detected in the sample.

The RPD from the duplicate analysis for several metals from sample S12EXFL-I-3-01 were outside QC limits and the RPD and the appropriate data have been flagged with an "*". The RPD from sample S12EXPR-B-2-01 were all within QC limits

The results for several metals were flagged with an "E" indicating the serial dilution was greater than the 10 % QC limit which may indicate matrix interference in the sample. All % difference results from the serial dilutions were <20 %.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

COLUMBIA ANALYTICAL SERVICES, INC.

Client: Parsons Engineering Science
Project: SEAD-12
Sample Matrix: Soil

Service Request No.: R0904258
Date Received: 7/31/09

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

These soil samples were collected on 7/30/09 and received at CAS on 7/31/09 at cooler temperatures of 4 - 5 °C. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory.

VOLATILE ORGANICS

Fourteen soil samples and one Trip Blank were analyzed for the TCL list of Volatile Organics by SW-846 method 8260B. Values detected between the MDL and PQL have been flagged with a "J" as estimated. Two soil samples were analyzed for the TCLP list of Volatile Organics by SW-846 method 8260B following the Zero Headspace Extraction procedure by method 1311.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The matrix spike/matrix spike duplicate analyses were performed on sample S12EXPR-O-8-03, as requested. Several matrix spike and matrix duplicate recoveries were outside QC limits of 70 – 130% and have been flagged with an "*". The Acetone MS/MSD recoveries were greater than 300 % indicating the Acetone was being produced after the addition of the matrix spiking solution.

The Method Blanks associated with these samples were free of contamination except a low level "J" flagged value for Acetone in the lab blank from 8/06/09. Any associated Acetone detected in the samples within 5X these values has been flagged with a "B" accordingly.

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

Fourteen soil samples were analyzed for the TCL List Semivolatiles by method 8270C from SW-846. All results between the PQL and MDL are flagged with a "J", as estimated. Two soil samples were analyzed for the TCLP list of Semivolatile Organics by SW-846 method 8270C following the TCLP Extraction procedure by method 1311.

All Tuning criteria for DFTPP were within QC limits.

All the initial and continuing calibration criteria were met for all analytes.

All Internal Standard Areas were within QC limits.

All surrogate standard recoveries were within acceptance limits

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits except Pyridine from the 8/17/09 LCS.

The matrix spike/matrix spike duplicate analyses were performed on sample S12EXPR-O-8-03, as requested. All matrix spike and matrix duplicate recoveries were within QC limits.

The Method Blanks associated with these samples were free of contamination except a low level "J" flagged value for Benzyl alcohol and Bis(2-ethylhexyl) Phthalate in the lab blank from 8/10/09. Any associated data detected in the samples within 5X these values has been flagged with a "B" accordingly.

No other QC or analytical problems were encountered.

PESTICIDE/PCB ANALYSIS

Sixteen soil samples were analyzed for the TCL List of Pesticides by method 8081A from SW-846 and PCB's by method 8082 from SW-846.

All the initial and continuing calibration criteria were met for all analytes.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits. Therecovereis on sample S12DS04 were diluted out and have been flagged with a "D".

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on samples S12EXPR-O-8-03 and S12EXPR-B-2-01, as requested. All matrix spike and matrix duplicate recoveries were within QC limits.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

INORGANIC ANALYSIS

Fourteen soil samples were analyzed for the TAL list of Metals using SW-846 methods 6010C/7471 and Total Cyanide by SW-846 meth0d 9012A. Two soil samples were analyzed for the TCLP list of Metals SW-846 methods 6010C/7470 following the TCLP Extraction procedure by method 1311. These two samples were also analyzed for Flash Point, Paint Filter Test and pH, and Reactivity. See the data sheets for the methods used.

NOTE: Due to LIMS limitations, when the Flash Point (Ignitability) results are >100 °C (samples do not flash), the samples are reported as "100 X".

All Blank spike (LCS) recoveries were within limits. The CRDL was within QC limits for all metals.

The matrix spike and duplicate analyses was performed on samples S12EXPR-O-8-03, as requested. All Matrix Spike Recoveries were within QC limits of 75 – 125 % except Antimony (51 %). The recovery and the appropriate data have been flagged with an "N". The recovery for Aluminum, Calcium, Iron, Manganese, and Magnesium could not be accurately determined due to the amount of analyte detected in the sample.

The RPD from the duplicate analysis were all within QC limits except Manganese. The RPD and the appropriate data have been flagged with an "*".

The serial dilution for Zinc was flagged with an "E" indicating the serial dilution was greater than the 10 % QC limit which may indicate matrix interference in the sample. All % difference results from the serial dilutions were <20 %.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

COLUMBIA ANALYTICAL SERVICES, INC.

Client: Parsons Engineering Science
Project: SEAD-12
Sample Matrix: Soil

Service Request No.: R0904367
Date Received: 8/05/09

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

These soil samples were collected on 8/04/09 and 8/05/09 and received at CAS on 8/05/09 at cooler temperatures of 5 - 6 °C. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory.

VOLATILE ORGANICS

Thirty soil samples and one Trip Blank were analyzed for the TCL list of Volatile Organics by SW-846 method 8260B. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The matrix spike/matrix spike duplicate analyses were performed on sample S12EXSW-D-2-01, as requested. All matrix spike and matrix duplicate recoveries and RPD were within QC limits.

The Method Blanks associated with these samples were free of contamination except a low level "J" flagged value for Acetone in the lab blank from 8/07/09 and Acetone and Methylene Chloride in the lab blank from 8/08/09. Any associated values detected in the samples within 5X these values have been flagged with a "B" accordingly.

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

Thirty soil samples were analyzed for the TCL List Semivolatiles by method 8270C from SW-846. All results between the PQL and MDL are flagged with a "J", as estimated.

All Tuning criteria for DFTPP were within QC limits.

All the initial and continuing calibration criteria were met for all analytes.

All Internal Standard Areas were within QC limits.

All surrogate standard recoveries were within acceptance limits

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on sample S12EXSW-D-2-01, as requested. All matrix spike and matrix duplicate recoveries were within QC limits. All RPD's were within QC limits except Hexachlorocyclopentadiene which has been flagged with an "*".

The Method Blanks associated with these samples were free of contamination except a low level "J" flagged value for Diethyl Phthalate in the lab blank from 8/07/09 and Benzyl Alcohol and Bis(2-ethylhexyl) Phthalate in the lab blank from 8/10/09. Any associated data detected in the samples within 5X these values has been flagged with a "B" accordingly.

No other QC or analytical problems were encountered.

PESTICIDE/PCB ANALYSIS

Thirty soil samples were analyzed for the TCL List of Pesticides by method 8081A from SW-846 and PCB's by method 8082 from SW-846.

All the initial and continuing calibration criteria were met for all analytes.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on sample S12EXSW-D-2-01, as requested and on sample S12EXSW-K-3-01. All matrix spike and matrix duplicate recoveries were within QC limits.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

INORGANIC ANALYSIS

Thirty soil samples were analyzed for the TAL list of Metals using SW-846 methods 6010C/7471 and Total Cyanide by SW-846 meth0d 9012A.

All Blank spike (LCS) recoveries were within limits. The CRDL was within QC limits for all metals.

The matrix spike and duplicate analyses was performed on samples S12EXSW-D-2-01, as requested. All Matrix Spike Recoveries were within QC limits of 75 – 125 % except Antimony (73 %), Potassium (73 %), and Zinc (191 %). The recovery and the appropriate data have been flagged with an "N". The recovery for Aluminum, Calcium, Iron, Manganese, and Magnesium could not be accurately determined due to the amount of analyte detected in the sample.

The RPD from the duplicate analysis were all within QC limits except Manganese. The RPD and the appropriate data have been flagged with an "*".

The serial dilution for Zinc was flagged with an "E" indicating the serial dilution was greater than the 10 % QC limit which may indicate matrix interference in the sample. All % difference results from the serial dilutions were <20 %.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Release of the data contained in this hard copy data package has been authorized by the Laboratory Manager or his designee, as verified by the following signature.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Parsons Engineering Science	**Service Request No.:**	R0904422
Project:	SEAD-12	**Date Received:**	8/07/09
Sample Matrix:	Soil		

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

These soil samples were collected on 8/06/09 and received at CAS on 8/07/09 at cooler temperatures of 4 - 5 °C. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory.

VOLATILE ORGANICS

Eleven soil samples and one Trip Blank were analyzed for the TCL list of Volatile Organics by SW-846 method 8260B. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The matrix spike/matrix spike duplicate analyses were performed on sample S12STOCK-C1-11, as requested. Several matrix spike recoveries were outside QC limits and have been flagged with an "*". All the RPDs were within QC limits.

The Method Blanks associated with these samples were free of contamination.

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

Eleven soil samples were analyzed for the TCL List Semivolatiles by method 8270C from SW-846. All results between the PQL and MDL are flagged with a "J", as estimated.

Sample S12STOCK-C1-10 was analyzed at a dilution due to matrix interference from non-target compounds.

All Tuning criteria for DFTPP were within QC limits.

All the initial and continuing calibration criteria were met for all analytes.

All Internal Standard Areas were within QC limits.

All surrogate standard recoveries were within acceptance limits

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on sample S12STOCK-C1-11, as requested. All matrix spike and matrix duplicate recoveries were within QC limits. All RPD's were within QC limits except Hexachlorocyclopentadiene which has been flagged with an "*".

The Method Blanks associated with these samples were free of contamination except a low level "J" flagged value for Benzyl Alcohol in the lab blank from 8/12/09 and Benzyl Alcohol and Bis(2-ethylhexyl) Phthalate in the lab blank from 8/10/09. Any associated data detected in the samples within 5X these values has been flagged with a "B" accordingly.

No other QC or analytical problems were encountered.

PESTICIDE/PCB ANALYSIS

Eleven soil samples were analyzed for the TCL List of Pesticides by method 8081A from SW-846 and PCB's by method 8082 from SW-846.

All the initial and continuing calibration criteria were met for all analytes.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on sample S12STOCK-C1-11, as requested. Several Pesticide matrix spike recoveries were outside QC limits and have been flagged with an "*".

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

INORGANIC ANALYSIS

Eleven soil samples were analyzed for the TAL list of Metals using SW-846 methods 6010C/7471 and Total Cyanide by SW-846 meth0d 9012A.

All Blank spike (LCS) recoveries were within limits. The CRDL was within QC limits for all metals.

The matrix spike and duplicate analyses was performed on samples S12STOCK-C1-11, as requested. All Matrix Spike Recoveries were within QC limits of 75 – 125 % except Antimony (73%), and Lead (72 %). The recovery and the appropriate data have been flagged with an "N". The recovery for Aluminum, Calcium, Iron, Manganese, and Magnesium could not be accurately determined due to the amount of analyte detected in the sample.

The RPD from the duplicate analysis were all within QC limits except Calcium and Lead. The RPD and the appropriate data have been flagged with an "*".

The serial dilution for Iron was flagged with an "E" indicating the serial dilution was greater than the 10 % QC limit which may indicate matrix interference in the sample.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Client:	Parsons Engineering Science	**Service Request No.:**	R0904425
Project:	SEAD-12	**Date Received:**	8/07/09
Sample Matrix:	Soil		

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

These soil samples were collected on 8/06/09 and received at CAS on 8/07/09 at cooler temperatures of 4 - 5 °C. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory.

VOLATILE ORGANICS

Four soil samples were analyzed for the TCLP list of Volatile Organics by SW-846 method 8260B following the Zero Headspace Extraction procedure by method 1311.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The Method Blanks associated with these samples were free of contamination.

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

Four soil samples were analyzed for the TCLP list of Semivolatile Organics by SW-846 method 8270C following the TCLP Extraction procedure by method 1311.

All Tuning criteria for DFTPP were within QC limits.

All the initial and continuing calibration criteria were met for all analytes.

All Internal Standard Areas were within QC limits.

All surrogate standard recoveries were within acceptance limits

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The Method Blanks associated with these samples were free of contamination.

No other QC or analytical problems were encountered.

PESTICIDE/PCB ANALYSIS

Four soil samples were analyzed for the TCL List of Pesticides by method 8081A from SW-846 and PCB's by method 8082 from SW-846.

All the initial and continuing calibration criteria were met for all analytes except several analytes from the Closing CCV on the back column. These analytes were flagged with a # no data was affected since the front column was used for quantitation and all anlytes were within QC limits.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits for the Pesticide analyses. The DCB and TCMX recoveries for the PCB analyses were diluted out for all samples and have been flagged with a "D".

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses was not requested but was performed on samples S12DS14. All matrix spike and matrix duplicate recoveries were diluted out and have been flagged with a "D".

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

INORGANIC ANALYSIS

Four soil samples were analyzed for the TCLP list of Metals SW-846 methods 6010C/7470 following the TCLP Extraction procedure by method 1311. These two samples were also analyzed for Flash Point, Paint Filter Test and pH, and Reactivity. See the data sheets for the methods used.

NOTE: Due to LIMS limitations, when the Flash Point (Ignitability) results are >100 °C (samples do not flash), the samples are reported as "100 X".

All Blank spike (LCS) recoveries were within limits. The CRDL was within QC limits for all metals.

No other analytical or QC problems were encountered.

Service Request No.: R0904596
Date Received: 8/14/09

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

These soil samples were collected on 8/13/09 and received at CAS on 8/14/09 at a cooler temperature of 14 °C. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory.

VOLATILE ORGANICS

One soil sample and one Trip Blank were analyzed for the TCL list of Volatile Organics by SW-846 method 8260B. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The matrix spike/matrix spike duplicate analyses was not requested, but was performed on sample S12EXFL-O-8-01. The matrix spike recoveries for Acetone were outside QC limits and have been flagged with an "*". All the RPDs were within QC limits except Acetone.

The Method Blanks associated with these samples were free of contamination except a "J" flagged value for Acetone. No data was affected.

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

One soil sample was analyzed for the TCL List Semivolatiles by method 8270C from SW-846. All results between the PQL and MDL are flagged with a "J", as estimated.

All Tuning criteria for DFTPP were within QC limits.

All the initial and continuing calibration criteria were met for all analytes.

All Internal Standard Areas were within QC limits.

All surrogate standard recoveries were within acceptance limits

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The Method Blanks associated with these samples were free of contamination.

No other QC or analytical problems were encountered.

PESTICIDE/PCB ANALYSIS

One soil sample was analyzed for the TCL List of Pesticides by method 8081A from SW-846 and PCB's by method 8082 from SW-846.

All the initial and continuing calibration criteria were met for all analytes.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

INORGANIC ANALYSIS

One soil sample was analyzed for the TAL list of Metals using SW-846 methods 6010C/7471 and Total Cyanide by SW-846 meth0d 9012A. Two soil samples were analyzed for the TCLP list of Metals by SW-846 methods 6010C/7470 following the TCLP Extraction procedure by method 1311.

All Blank spike (LCS) recoveries were within limits. The CRDL was within QC limits for all metals.

No other analytical or QC problems were encountered.

COLUMBIA ANALYTICAL SERVICES, INC.

Client:	Parsons Engineering Science	**Service Request No.:**	R0905678
Project:	SEAD-12 RA	**Date Received:**	10/06/09
Sample Matrix:	Soil		

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

Four soil samples were taken on 10/05/09 and one water sample was taken on 10/06/09. All were received at CAS on 10/06/09 at a cooler temperature of 6 °C. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory.

VOLATILE ORGANICS

Four soil samples and one water sample were analyzed for the TCL list of Volatile Organics by SW-846 method 8260B. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The matrix spike/matrix spike duplicate analyses were performed on sample S12EXSW-I-3-01, as requested. Several matrix spike and matrix duplicate recoveries were outside QC limits of 70 – 130% and have been flagged with an "*". The Acetone MS/MSD recoveries were greater than 100 % indicating the Acetone was being produced after the addition of the matrix spiking solution.

The Method Blanks associated with these samples were free of

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

Four soil samples and one water sample were analyzed for the TCL List Semivolatiles by method 8270C from SW-846. All results between the PQL and MDL are flagged with a "J", as estimated.

All Tuning criteria for DFTPP were within QC limits.

All the initial and continuing calibration criteria were met for all analytes.

All Internal Standard Areas were within QC limits.

All surrogate standard recoveries were within acceptance limits

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits except for a few that were slightly above limits. No data was affected. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on sample S12EXSW-I-3-01, as requested. Many of the matrix spike recoveries were outside QC limits while most of the matrix spike duplicate recoveries were within QC limits. This may indicate a bad spiking procedure for the MS. All recoveries and RPD outside QC limits have been flagged with an "*".

The Laboratory Blanks associated with these samples were free of contamination.

No other QC or analytical problems were encountered.

PESTICIDE ANALYSIS

Four soil samples and one water sample were analyzed for the TCL List of Pesticides by method 8081A from SW-846. The samples were cleaned up for sulfur and sent through a florisil column prior to analysis. All samples still exhibited matrix interference problems.

All the initial and continuing calibration criteria were met for all analytes except for several analytes on the back column of the closing calibration check. Due to this, all samples were reanalyzed at a 1/10 dilution and all CCVs were within limits. Both dilutions were reported.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits for all samples.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed due to sample amount limitations.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

PCB ANALYSIS

Four soil samples and one water sample were analyzed for the TCL List of PCB's by method 8082 from SW-846. The samples were cleaned up for sulfur, treated with acid, and sent through a florisil column prior to analysis. All samples still exhibited matrix interference problems.

All the initial and continuing calibration criteria were met for all analytes.

The surrogate standard recoveries for DCB and TCMX were outside QC acceptance limits high for all soil samples. Since the recoveries were high and the samples were all non-detect, the data was accepted.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits.

The matrix spike/matrix spike duplicate analyses were performed on sample S12EXSW-I-3-01 for the PCB analysis, as requested. All matrix spike and matrix duplicate recoveries were outside QC limits high and have been flagged with an "*". This was due to matrix interference in the sample.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

INORGANIC ANALYSIS

Four soil samples and one water sample were analyzed for the TAL list of Metals using SW-846 methods 6010C/7471 and Total Cyanide by SW-846 meth0d 9012A.

All Blank spike (LCS) recoveries were within limits. The CRDL was within QC limits for all metals.

The matrix spike and duplicate analyses was performed on sample S12EXSW-I-3-01, as requested. All Matrix Spike Recoveries were within QC limits of 75 – 125 %. The recovery for Aluminum, Calcium, Iron, Manganese, and Magnesium could not be accurately determined due to the amount of analyte detected in the sample. The RPD from all within QC limits.

The ICP serial dilution and results for Lead were flagged with an "E" indicating the serial dilution was greater than the 10 % QC limit which may indicate matrix interference in the sample. All % difference results from the serial dilutions were <20 %.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. COLUMBIA ANALYTICAL SERVICES, INC.

Client: Parsons Engineering Science
Project: SEAD-12 RA
Sample Matrix: Soil

Service Request No.: R0905778
Date Received: 10/08/09

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

Five soil samples were taken on 10/07/09. All were received at CAS on 10/08/09 at cooler temperatures of 5 and 16 °C. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory.

VOLATILE ORGANICS

Five soil samples and one water sample were analyzed for the TCL list of Volatile Organics by SW-846 method 8260B. Values detected between the MDL and PQL have been flagged with a "J" as estimated.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The Method Blanks associated with these samples were free of

No other analytical or QC problems were encountered.

SEMIVOLATILE ORGANICS

Five soil samples and one water sample were analyzed for the TCL List Semivolatiles by method 8270C from SW-846. All results between the PQL and MDL are flagged with a "J", as estimated.

All Tuning criteria for DFTPP were within QC limits.

All the initial and continuing calibration criteria were met for all analytes.

All Internal Standard Areas were within QC limits.

All surrogate standard recoveries were within acceptance limits.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were all within QC limits. All RPD's were within QC limits.

The matrix spike/matrix spike duplicate analyses were not requested but were performed on sample S12EXFL-J-2-02. All the matrix spike recoveries and RPD were within QC limits.

The Laboratory Blanks associated with these samples were free of contamination.

No other QC or analytical problems were encountered.

PESTICIDE ANALYSIS

Five soil samples and one water sample were analyzed for the TCL List of Pesticides by method 8081A from SW-846. The samples were cleaned up for sulfur and sent through a florisil column prior to analysis. All samples still exhibited matrix interference problems.

All the initial and continuing calibration criteria were met for all analytes.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits for all samples except TCMX on sample S12EXSW-I-2-03. The sample was re-extracted and re-analyzed and the TCMX recovery was within limits. Both results were reported.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits. All RPD's were within QC limits.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

PCB ANALYSIS

Five soil samples and one water sample were analyzed for the TCL List of PCB's by method 8082 from SW-846. The samples were cleaned up for sulfur, treated with acid, and sent through a florisil column prior to analysis. All samples still exhibited matrix interference problems.

All the initial and continuing calibration criteria were met for all analytes.

The surrogate standard recovery for DCB and TCMX were within QC acceptance limits for all samples except TCMX on sample S12EXSW-I-2-03. The sample was re-extracted and re-analyzed and the TCMX recovery was within limits. Both results were reported.

All Blank Spike (LCS)/Blank Spike Duplicate (LCSD) recoveries were within QC limits.

The Laboratory Blanks associated with these analyses were free of contamination.

All samples were extracted and analyzed within required holding times.

No other analytical or QC problems were encountered.

INORGANIC ANALYSIS

Five soil samples and one water sample were analyzed for the TAL list of Metals using SW-846 methods 6010C/7471 and Total Cyanide by SW-846 meth0d 9012A.

All Blank spike (LCS) recoveries were within limits. The CRDL was within QC limits for all metals.

The matrix spike and duplicate analyses was not requested but performed on sample S12EXFL-J-2-02 for Mercury. The Matrix Spike Recovery was within QC limits of 75 – 125 %. The RPD was within QC limits.

The ICP serial dilution for Lead (12 %) was flagged with an "E" indicating the serial dilution was greater than the 10 % QC limit which may indicate matrix interference in the sample. All % difference results from the serial dilutions were <20 %.

No other analytical or QC problems were encountered.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the details conditioned above. Date Received: 10/09/09

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier IV, ASP-B deliverables. When appropriate to the method, method blank results have been reported with each analytical test.

SAMPLE RECEIPT

Five soil samples were taken on 10/09/09. All were received at CAS on 10/09/09 at a cooler temperature of 9 °C. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 1 - 6 °C upon receipt at the laboratory. "Rush" results were sent by e-mail on 10/16/09.

VOLATILE ORGANICS

Two soil samples were analyzed for the TCLP list of Volatile Organics by SW-846 method 8260B following the the Zero Headspace Extraction by method 1311.

All Tuning criteria for BFB were and within QC limits.

Internal Standard Areas were within QC limits for all samples.

All the initial and continuing calibration criteria were met for all analytes.

All surrogate standard recoveries were within acceptance limits for all samples.

The Blank Spike (LCS) recoveries were all acceptable.

The Method Blanks associated with these samples were free of

No other analytical or QC problems were encountered.

Project Management Case Narrative

INTRODUCTION/ANALYTICAL RESULTS

This report summarizes the laboratory results for Parsons Infrastructure & Technology Group, Inc. for the Seneca Army Depot soil testing project.

CONDITION UPON RECEIPT/CHAIN OF CUSTODY

The cooler(s) were received intact. When the cooler(s) were received by the laboratory, the sample custodian(s) opened and inspected the shipment(s) for damage and custody inconsistencies. Chain of custodies documenting receipt are presented in the chain of custody section. Each sample was assigned a unique laboratory number and a custody file created. The samples were placed in a secured walk-in cooler and signed in and out by the chemists performing the tests. The sign out record, or lab chronicle, is presented in the chain of custody section.

There were no discrepancies noted upon sample receipt. The temperature of the iced cooler was -1.8°C.

METHODOLOGY

The following methods were used to perform the analyses:

PARAMETER	METHOD	REFERENCE
Volatile Organics	8260B	1
Semivolatile Organics	8270C	1
Pesticides	8081	1
PCBs	8082	1
ICP Metals	6010B	1
Mercury	7471A	1
Reactive Cyanide	SW7.3.3	1
Percent Moisture	SM 2540G	2

1) Test Methods for Evaluation Solid Wastes, SW-846 Third Edition, Final Update III, December 1996.

2) Standard Methods for the Examination of Water and Wastewater, $18^{th} - 20^{th}$ Editions.

QUALITY CONTROL

QA/QC results are summarized in the Laboratory Report Package and are also included in the raw data.

RAW DATA

The raw data is organized in the New York State Department of Environmental Conservation Analytical Services Protocol Category "B" order of data requirements.

QA/QC Review (Initials/Date): [illegible] 10/28/09

File Name: G:\Narratives\MSVoa\0910067msvnar.doc

GC/MS Volatile Organics
The GC/MS Volatile instruments are equipped with a Restek Rtx-VMS, 60 m x 0.25 mm ID capillary column (MS01), Restek Rtx-502.2, 105 m x 0.53 mm ID capillary column (MS02), Restek Rtx-502.2, 60 m x 0.25 mm ID capillary column (MS03) and Restek Rtx-VMS, 60 m x 0.25mm ID capillary column (MS04), and a Vocarb 3000 adsorbent trap.

There were no excursions to note. All QC results were within established control limits.

Holding Times and Sample Preservation
All samples were prepared and analyzed within the method and/or QAPP specified holding time requirements.

Laboratory Control Sample
All spike recoveries met method and/or project specific QC criteria.

MS/MSD/MSB
All spike recovery and RPD data met method and/or project specific QC criteria.

Surrogate Standards
All surrogate standard recoveries met method and/or project specific QC criteria.

Internal Standards
All internal standard areas met method and/or project specific QC criteria.

Calibrations
All initial calibrations and calibration verifications met method and/or project specific QC criteria.

Preparation Blanks
All preparation blanks met method and/or project specific QC criteria.

GC/MS Semi-Volatile Organics Case Narrative

Client ID:	PARSONS-MS
Project/Order:	Seneca Army Depot
Work Order #:	0910067
Methodology:	8270C

Analyzed/Reviewed by (Initials/Date): JMA 10/26/09

Supervisor/Reviewed by (Initials/Date): JW 10-27-09

QA/QC Review (Initials/Date): [illegible] 10/28/09

File Name: G:\Narratives\MSSemi\0910067svnar.doc

GC/MS Semi-Volatile Organics
The GC/MS Semi-volatile instruments used a J & W DB-5MS, 30 m x 0.25 mm ID capillary column.

Holding Times and Sample Preservation
All samples were prepared and analyzed within the method and/or QAPP specified holding time requirements.

Laboratory Control Sample
All spike recoveries met method and/or project specific QC criteria.

MS/MSD/MSB
The following compound(s) did not meet matrix spike/matrix spike duplicate percent recovery and/or RPD criteria:

Sample Description	Sample #	Compound	% REC	RPD	Corrective Action
S12EXFL-I-4-01	0910067-005BMS	several	X	X	1

1 The extract was compromised during sample preparation. Spike recoveries for the associated matrix spike duplicate, laboratory control sample and matrix spike blank met acceptance criteria. No corrective action was taken.

Surrogate Standards
All surrogate standard recoveries met method and/or project specific QC criteria.

Internal Standards
All internal standard areas met method and/or project specific QC criteria.

Calibrations
All initial calibrations and calibration verifications met method and/or project specific QC criteria.

Preparation Blanks
All preparation blanks met method and/or project specific QC criteria.

GC Semi-Volatile Organics Case Narrative

Client:	Parsons-MS
Project/Order:	Seneca Army Depot
Work Order. #:	0910067
Methodology:	8081

Pesticides

Holding Times
All samples were prepared and analyzed within the method and/or QAPP specified holding time requirements.

Laboratory Control Samples
All spike recoveries met method and/or project specific QC criteria.

MS/MSD/MSB
The following compound(s) did not meet matrix spike/matrix spike duplicate percent recovery and/or RPD criteria:

Sample Description	Sample #	Compound	% REC	RPD	Corrective Action
S12EXFL-I-4-01MS	0910067-005CMS	multiple	X	X	1,3
S12EXFL-I-4-01MSD	0910067-005CMSD	beta-BHC	X	X	2,3

1. Inspection of the chromatograms indicates that the MS has an interference pattern not present in the parent sample and the MSD. It is suspected that contamination was introduced during the sample preparation procedures for the MS.

2. The recovery marginally exceeded the upper control limit on the confirmation column and met acceptance criteria on the primary column. The analyte was not detected in the parent sample.

3. The associated MSB met acceptance criteria. No corrective action was taken.

Surrogates
All surrogate recoveries met method and/or project specific criteria.

Calibrations
All calibrations and calibration verifications met method and/or project specific QC criteria.

GC Semivolatile Organics Case Narrative - Page 2

Client:	Parsons-MS
Project/Order:	Seneca Army Depot
Work Order. #:	0910067
Methodology:	8081

Preparation Blanks
All preparation blanks met method and/or project specific QC criteria.

Miscellaneous
The Endrin breakdown on the RTX-CLP column failed marginally at 15.4%. No Endrin or any of its breakdown products were detected in any samples and the breakdown met quality control criteria on the RTX-CLP2 column. Therefore, no corrective action was taken.

GC Semi-Volatile Organics Case Narrative

PCBs

Holding Times
All samples were prepared and analyzed within the method and/or QAPP specified holding time requirements.

Laboratory Control Samples
All spike recoveries met method and/or project specific QC criteria.

MS/MSD/MSB
The following compound(s) did not meet matrix spike/matrix spike duplicate percent recovery and/or RPD criteria:

Sample Description	Sample #	Compound	% REC	RPD	Corrective Action
S12EXFL-I-4-01MS	0910067-005CMS	AR1016	X		1
S12EXFL-I-4-01MSD	0910067-005CMSD	AR1016	X		1

1. The recovery in the associated MSB met acceptance criteria. Matrix effects are suspected. No corrective action was taken.

Surrogates
All surrogate recoveries met method and/or project specific criteria.

Calibrations
All calibrations and calibration verifications met method and/or project specific QC criteria.

Preparation Blanks
All preparation blanks met method and/or project specific QC criteria.

Trace Metals Case Narrative

Client ID:	Parsons

QA/QC Review (Date/Initials): 11/4/09

Trace Metals

Holding Times
All samples were prepared and analyzed within the method and/or QAPP specified holding time requirements.

Laboratory Control Sample
All spike recoveries met method and/or project specific QC criteria.

MS/MSD AND MS/MSD RPD
The following analytes did not meet matrix spike/matrix spike duplicate percent recovery criteria:

Sample Description	Sample #	Analyte	% REC	RPD	Corrective Action
S12EXFL-I-4-01	0910067-005D	Al, Ca, Fe, Mg, Mn	X		1
		Sb	X		2

1. The concentration of the analyte in the sample was four times greater than the concentration of the spike added. A post-digestion spike was performed. No further corrective action was taken.

2. A post digestion spike was performed. No further corrective action was taken.

ICP Serial Dilution
The following analyte did not meet ICP serial dilution recovery criteria:

Sample Description	Sample #	Analyte	Corrective Action
S12EXFL-I-4-01	0910067-005D	K	1

1. A post digestion spike was performed. No further corrective action was taken.

Calibrations
All calibrations and calibration verifications met method and/or project specific QC criteria.

Preparation Blanks
All preparation blanks met method and/or project specific QC criteria.

APPENDIX G

DATA VALIDATION MEMO

(This page has been intentionally left blank)

APPENDIX G: DATA VALIDATION

This appendix presents an overall summary of data usability for the SEAD-12 soil confirmatory samples collected as part of the Remedial Action completed between July and October 2009. The data reviewed included nine sample delivery groups (SDG) submitted by Columbia Analytical Services (CAS) located in Rochester, NY; and one SDG submitted by Life Science Laboratories (LSL) located in East Syracuse, NY. These SDGs are R0904203, R0904258, R0904367, R0904422, R0904596, R0905568, R0905678, R0905778, R0905818, and 0910067. **Table G-1** provides a summary of the data that were validated. In summary, 92 confirmatory soil samples from SEAD-12 were submitted for analysis of target compound list (TCL) volatile organic compounds (VOC), TCL semivolatile organic compounds (SVOC), Pesticides, Polychlorinated biphenyl (PCBs), Inorganics including cyanide and mercury; 4 confirmatory samples from SEAD-12 were submitted for analysis of PCBs; and one excavation water sample from SEAD-12 were submitted for analysis of TCL VOC, TCL SVOC, Pesticides, PCBs, Inorganics including cyanide and mercury. The analyses were conducted in accordance with VOCs by United States Environmental Protection Agency (USEPA) Method SW846 8260B, SVOCs by USEPA Method SW846 8270C, pesticides by USEPA Method SW846 8081A, PCBs by USEPA Method SW846 8082, and metals by USEPA Method SW846 6010B/7471A.

In addition to the confirmatory soil samples described above, disposal material waste characterization and radiological samples were collected as part of the SEAD-12 remedial action program. Validation of the results for these samples was not required for the project, and, therefore these sample results are not presented or discussed in this appendix.

Data validation was performed by Parsons' chemists and completed under the guidelines set forth in the Region 2 Resource Conservation and Recovery Act (RCRA) and Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Data Validation Standard Operating Procedures (SOPs) with consideration for the site-specific quality assurance requirements presented in the Work Plan for Removal Action at the Waste Burial Radiological Sites (SEAD-12) (Parsons, 2009) and the general quality assurance requirements presented in the Generic Site-Wide Sampling and Analysis Plan (SAP) for the Seneca Army Depot Activity (Parsons, 2006). The Region 2 SOPs used for data validation include Evaluation of Metals Data for the Contract Laboratory Program (CLP; SOP HW-2), Validating Volatile Organic Compounds by SW-846 Method 8260B (HW-24), Validating Semivolatile Organic Compounds by SW-846 Method 8270 (HW-22), and CLP Organics Data Review and Preliminary Review, and Training Course for CLP Organic Data Validation. If guidance could not be found in the above SOPs, the project SAP, or the Seneca Site-Wide SAP, requirements set forth in the USEPA CLP, the New York State Department of Environmental Conservation (NYSDEC) Contract Laboratory Program Analytical Services Protocol (ASP), USEPA (2004) Contract Laboratory Program National Functional Guidelines for Inorganic Data Review; and USEPA (1999) Contract Laboratory Program National Functional Guidelines for Organic Data Review were considered during data validation. The data evaluation included performance of a

completeness audit and a review of the following parameters, where applicable: holding times, sample preservations, percentage of solids, quality control (QC) results of calibration, equipment/rinsate blanks, method blanks, matrix spike/matrix spike duplicate (MS/MSD) analyses, laboratory control sample (LCS) performances, laboratory and field duplicates, instrument performance, reporting limits, Inductively Coupled Plasma (ICP) serial dilution, interference check sample results, and ICP linear range. In performing the data validation, the raw data were spot-checked in accordance with the Region 2 SOPs to evaluate whether there were any transcription errors.

Data qualifiers were added to the data based on the data validation and Attachment G-1 presents definition of data qualifiers.

1. OVERALL SUMMARY OF DATA USABILITY

The data reviewed were determined to be usable based on the data validation.

2. ACCURACY

Accuracy was evaluated by reviewing the percent recovery (%R) of the MS/MSD, LCS, surrogate spikes, and internal standards. In addition, blank sample (method blank, trip blank, and equipment rinsate blank) results were reviewed to evaluate any potential contamination.

2.1 MS/MSD Results

MS/MSD sample analyses were conducted for 14 project samples and are summarized in **Table G-2**. The frequency of MS/MSD sample analyses conducted is consistent with the generic requirement for Seneca project presented in the Generic Site-Wide Sampling and Analysis Plan (Parsons, 2006). For VOC analysis, the samples were spiked with five analytes (1,1-dichloroethene, trichloroethene, benzene, toluene, and chlorobenzene). For SVOC analysis, the samples were spiked with six analytes (2,4,6-tribromophenol, 2-fluorobiphenyl, 2-fluorophenol, nitrobenzene-d5, phenol-d6, and p-terphenyl-d14). For pesticide and PCB analyses, the samples were spiked with decachlorobiphenyl and tetrachloro-m-xylene. For metal analyses, the samples were spiked with all target compound analytes. All those metal results in the SDGs without spike analysis conducted were qualified according to the Region 2 SOP (i.e., all detects were qualified J).

All MS/MSD recoveries were within the laboratory established QC limits or/and the project limits of 75%-125% for all samples except those summarized in **Table G-3**.

In general, MS/MSD results for VOC, SVOC, pesticides, PCBs, and metal analyses indicated some matrix impact. No action was taken based solely on the MS/MSD results for VOC, SVOC, pesticide, and PCBs analyses. Qualifiers were added to the affected metal results based on the spike results in accordance with the USEPA Region 2 SOPs and the details are presented in **Table G-3**.

2.2 LCS Results

LCS results for VOC and SVOC analyses were all within the laboratory established limits and the project advisory limits of 70~130% with the exception of the LCS results for acetone and methyl ethyl ketone in one SDG were above 120%, as summarized in **Table G-4**. LCS results for pesticide analysis were all within the laboratory established limits. LCS results for PCB analysis were all within the laboratory established limits and the project advisory limits of 70~130% with relative percent difference (RPD) < 25%. LCS results for metal analysis were all within the project limits of 80%~120% with the exception of the LCS results for antimony in seven SDGs and iron in one SDG were above 120%, as summarized in **Table G-4**. No action was taken on the acetone, methyl ethyl ketone, antimony, and iron results since the recoveries were within the lab limits.

2.3 Surrogate Recovery Results

Surrogate spike analyses were conducted for VOC, SVOC, pesticide, and PCB samples. **Table G-5** presents a summary of surrogate recovery noncompliance. All the other surrogate spike recoveries were within the laboratory established limits and the project limits of 70~130% for VOC analysis, within the laboratory established limits for SVOC analysis, and within 30-150% for pesticide and PCB analyses.

2.4 Internal Standard Results

Internal standards were added to VOC and SVOC samples to determine instrument stability. All the internal standard recoveries were within the project QC limits (i.e., the internal standard area responses were within -50% ~ +100% of the internal standard area associated with CCV and all retention times were within 30 seconds of the standard associated with CCV.)

2.5 Blank Sample Results

Method blank analysis was conducted for each SDG per analytical method. No sampling equipment/instrument was reused in collecting VOC, SVOC, pesticide, PCB, or metal samples during the confirmatory sample collection; therefore, no equipment rinsate blank was collected for the project.

Table G-6 presents a summary of blank noncompliance results. In summary, no pesticide or PCB contamination was detected in any pesticide or PCB method blanks. For VOC analysis, acetone was detected in the method blanks in SDGs R0904203, R0904258, R0904367, and R0904422; acetone was detected in the trip blank in SDGs R0904258; methylene chloride was detected in a method blank in SDGs R0904367. For SVOC analysis, Benzyl Alcohol, Bis(2-Ethylhexyl) Phthalate, and Diethyl Phthalate were detected in the method blanks in SDGs R0904258, R0904367, R0904422, and R0905778. The affected sample results were qualified in accordance with the USEPA Region 2 SOPs.

Various metals were detected in the initial calibration blanks (ICBs), continuing calibration blanks (CCBs), and preparation blanks in most SDGs, as shown in **Table G-6**. Most of the detected concentrations were all below the respective reporting limits. The sample results associated with the noncompliance blank results were qualified in accordance with the USEPA Region 2 SOPs.

3. PRECISION

Precision is determined by evaluating the RPD of the parent/field duplicate (FD) and MS/MSD (VOC, SVOC, pesticide, and PCB analyses) or parent/laboratory duplicate (metal analysis). The generic precision limits for the Seneca project are presented in the Generic Site-Wide Sampling and Analysis Plan for the Seneca Army Depot Activity (Parsons, 2006). Professional judgment will be used based on the USEPA Region SOP for metal data validation (i.e., HW-2) when sample results are close to reporting limits. As an example, for sample results within five times of reporting limits, the difference was compared with two times of the reporting limits.

As shown in **Table G-7**, a total of six field duplicate pairs were available for the confirmatory soil samples collected from SEAD-12 for VOC, SVOC, pesticide, PCB, and metal analyses. The field duplicate collection frequency is compliant with the requirement specified in the Generic Site-Wide SAP. All field duplicate results comply with the project limits presented in the Generic Site-Wide SAP or the criteria discussed above with several exceptions as presented in **Table G-8**.

Laboratory duplicate analysis was conducted for metal analysis for all SDGs but R0904596 and 0910067. For SDG R0904596, laboratory duplicate analysis was not performed due to there being a single sample in the SDG. For SDG 0910067, laboratory duplicate analysis was not performed. All metal results in those SDGs without laboratory duplicate analysis performed were qualified (i.e., nondetects were qualified UJ and detects were qualified J). All laboratory duplicate results comply with the project limits presented in the Generic Site-Wide SAP or the criteria discussed above with several exceptions as presented in **Table G-8**.

All RPD results for MS/MSD samples were within the laboratory established limits and the project limit of 25%.

4. REPRESENTATIVENESS AND OTHER TECHNICAL ISSUES

Representativeness expresses the degree to which sample data accurately and precisely represents actual site conditions. Representativeness has been evaluated by:

- Sample Package Completeness and Deliverables
- Sample Preservation and Technical Holding Time
- Laboratory Transcription Error
- Other Quality Assurance/Quality Control (QA/QC) Results

4.1 Sample Package Completeness and Deliverables

The nine data packages submitted by CAS Rochester, NY are sufficient for the data validation conducted for this project. The data package submitted by LSL East Syracuse, NY is sufficient for the data validation conducted for this project.

4.2 Sample Preservation and Technical Holding Time

All samples were preserved according to the preservation requirement presented in the Generic Site-Wide SAP and analyzed within the holding time.

All coolers were received with temperature below 10ºC, within the limits specified by the USEPA Region II SOP HW-24 (i.e., 10ºC) and the USEPA (1999) Contract Laboratory Program National Functional Guidelines for Organic Data Review (i.e., 4±2 ºC) except SDGs R0904203 and R0904596. SDG R0904203 had one cooler (of five coolers) with a received temperature of 12ºC. SDG R0904596 cooler was received with a temperature of 14ºC. SDG R0905778 had one cooler (of three coolers) with a received temperature of 16ºC, however this cooler did not contain samples for chemical analysis. SDG's with elevated temperatures were qualify all results as J due to the elevated temperature in the sample cooler, since samples can not be associated with specific coolers.

4.3 Laboratory Transcription Error

The raw data were spot-checked in accordance with the Region 2 SOP and no transcription error was observed.

4.4 Other QA/QC Results

4.4.1 Instrument Performance

GC/MS instrument performance check was performed for VOC, SVOC, pesticide, and PCB analyses. GC/MS performance met the analytical method requirements for all SDGs. Chromatography baselines were generally stable for organic analyses.

4.4.2 TCL/TIC Results

For VOC and SVOC TCLs detected in the samples, a comparison of the sample relative ion intensities with the standard relative ion intensities for the respective reference TCL was conducted. All relative retention times (RRTs) for the identified analytes were within 0.06RRT units of the standard RRT from continuing calibration verification. The relative ion intensities generally agree within 20% of the standard relative ion intensities with several exceptions. No action was taken based on the review of the mass spectrums.

For pesticide and PCB TCLs detected in the samples, a comparison of the retention times (RTs) of

identified compounds with established RT windows for both columns. The percent difference (%D) between the two columns for positive sample results is to be less than or equal to 25%. All SDG's met these requirements except five SDGs presented in **Table G-9**.

Tentatively identified compounds (TICs) were not reported for VOC or SVOC analyses for SEAD-12 confirmatory samples.

4.4.3 Reporting Limits

For VOC, SVOC, pesticide, and PCB analyses, the lowest calibration standard was used as the reporting limit and the reporting limits are the same as the CRQL specified by the CLP OLM04.3. For inorganic analyses, method detection limit was used as the basis for reporting limit and all reporting limits were below the CRQLs.

4.4.4 Calibration

Initial calibration and continuing calibration verification were conducted for VOC, SVOC, pesticide, PCB, and metal analyses. Calibration noncompliances were observed for most SDGs and the detailed information is presented in **Table G-10**. The affected data were validated based on the USEPA Region 2 SOPs.

CRQL standard check was conducted for metal analysis and the results were within the project limits of 70% - 130% with the exceptions listed in **Table G-11**.

4.4.5 ICP Serial Dilution

All ICP serial dilution results were within the limits specified in the USEPA Region 2 SOPs with the exceptions summarized in **Table G-12**. The results for the noncompliance metals were qualified in accordance with the Region 2 SOP HW-2.

4.4.6 ICP Linear Range

All inorganic concentrations used as sample results were within the ICP linear ranges.

4.4.7 ICP Interference Check

All ICP interference check sample results were with the QC limits (i.e., 80-120%).

DEFINITIONS OF DATA QUALIFIERS – ORGANICS

U	The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

DEFINITIONS OF DATA QUALIFIERS – INORGANICS

J	The associated value is an estimated quantity.
U	The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit.
UJ	The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise.
R	The data was unusable. (Note: Analyte may or may not be present.).

VOC				
R0904203	S12EXFL-I-3-01	The following did not met the recovery requirement: Acetone (430% MS, 343% MSD), Benzene (66% MSD), Bromodichloromethane (69% MS, 68% MSD), Carbon Tetrachloride (66% MS, 65% MSD), Chlorobenzene (65% MS, 66% MSD), 1,1-Dichloroethene (66% MSD), Cis-1,2-Dichloroethene (69% MS, 66% MSD), Trans-1,2-Dichloroethene (64% MS, 62% MSD), Cis-1,3-Dichloropropene (65% MS, 64% MSD), Trans-1,3-Dichloropropene (65% MS, 65% MSD), Ethylbenzene (66% MS, 66% MSD), 2-Hexanone (Methyl butyl ketone) (67% MS, 69% MSD), Styrene (64% MS, 67% MSD), Tetrachloroethene (64% MS, 62% MSD), Toluene (65% MS), 1,1,1-Trichloroethane (69% MSD), Trichloroethene (69% MS), Otho-Xylenes (63% MS, 65% MSD), and M/P-Xylenes (64% MS, 64% MSD).	S12EXFL-I-3-01	Qualify sample S12EXFL-I-3-01 Acetone detects as J. Qualify sample S12EXFL-I-3-01 Bromodichloromethane, Carbon Tetrachloride, Chlorobenzene, Cis-1,2-Dichloroethene, Trans-1,2-Dichloroethene, Cis-1,3-Dichloropropene, Trans-1,3-Dichloropropene, Ethylbenzene, 2-Hexanone (Methyl butyl ketone), Styrene, Tetrachloroethene, Otho-Xylenes, and M/P-Xylenes results as J.
R0904203	S12EXPR-B-2-01	Acetone (314% MS, 314% MSD) did not met the recovery requirement	S12EXPR-B-2-01	Qualify sample S12EXPR-B-2-01 Acetone detects as J.
R0904258	S12EXPR-O-8-03	The following did not met the recovery requirement: Acetone (1166% MS, 1231% MSD), Bromoform (65% MSD), Bromomethane (45% MS, 35% MSD), 2-Butanone (MEK) (23% MS, 22% MSD), Cis-1,3-Dichloropropene (42% MS, 34% MSD), Trans-1,3-Dichloropropene (53% MS, 41% MSD), 2-Hexanone (Methyl butyl ketone) (9% MS, 4% MSD w %RPD 74%), Methyl isobutyl ketone (19% MS, 9% MSD w %RPD 67%), Styrene (63% MS, 53% MSD), Otho-Xylenes (68% MSD), and M/P-Xylenes (69% MSD).	S12EXPR-O-8-03	Qualify sample S12EXPR-O-8-03 Acetone detects as J. Qualify sample S12EXPR-O-8-03 Bromomethane, 2-Butanone (MEK), Cis-1,3-Dichloropropene, Trans-1,3-Dichloropropene, 2-Hexanone (Methyl butyl ketone), Methyl isobutyl ketone, and Styrene results as J.
R0904422	S12STOCK-C1-11	The following did not met the recovery requirement: 2-Butanone (MEK) (48% MS), Chloromethane (69% MS), Cis-1,3-Dichloropropane (60% MS, 58% MSD), Trans-1,3-Dichloropropene (61% MS, 58% MSD), 2-Hexanone (24% MS, 25% MSD), 4-Methyl-2-pentanone (MIBK) (50% MS, 50% MSD), and Styrene (68% MSD).	S12STOCK-C1-11	Qualify sample S12STOCK-C1-11 for Cis-1,3-Dichloropropane, Trans-1,3-Dichloropropene, 2-Hexanone, and 4-Methyl-2-pentanone (MIBK) results as J.
R0904596	S12EXFL-O-8-01	%Rec met requirements except for Acetone (158% MS, 347% MSD) with a %RPD = 75%.	S12EXFL-O-8-01	Qualify sample S12EXFL-O-8-01 Acetone detect as J.
R0905678	S12EXSW-I-3-02	%Rec met requirements except for the following: Acetone (712% MS, 893% MSD), Bromomethane (59% MSD), 2-Hexanone (Methyl butyl ketone) (66% MS, 55% MSD), Methyl isobutyl ketone (69% MSD). %RPD met requirements except Bromomethane (32%).	S12EXSW-I-3-02	Qualify sample S12EXSW-I-3-02 Acetone detect as J. Qualify sample S12EXSW-I-3-02 Methyl butyl ketone result as J.
R0905778		MS/MSD analysis was not conducted on any project sample for this SDG		No action was taken based on MS/MSD results alone.
SVOC				
R0904203	S12EXFL-I-3-01	Hexachlorocyclopentadiene (%RPD = 72%) did not met the recovery requirement	S12EXFL-I-3-01	No action was taken based on the MS/MSD results alone.
R0905678	S12EXSW-I-3-02	The MS had 46 of the 65 SVOCs parameters with %Rec below their limits. The MSD had 4 parameters with %Rec below their limits. The %RPD was abve 30% for all SVOC parameters except 2,4-Dinitrophenol.	S12EXSW-I-3-02	No action was taken based on the MS/MSD results alone.

Table G-3
Summary of Spike Analysis Results
Construction Completion Report for SEAD-12
Seneca Army Depot Activity

SDG	Spiked Sample	Noncompliance	Sample Affected	Action
Pesticides				
R0904422	S12STOCK-C1-11	All pesticides had %Rec between the columns <20% for all pesticides except: Endrin Ketone (139% MS, 341% MSD with RPD 84%), Heptachlor (155% MS), and Delta-BHC (136% MS).	S12STOCK-C1-11	Qualify sample S12STOCK-C1-11 results for Endrin Ketone as J.
R0905678		MS/MSD analysis was not conducted on any project sample for this SDG, however a MS/MSD analysis was performed. All pesticides had %RPD between the columns <20% for all pesticides.		No action was taken based on MS/MSD results alone.
R0905778		MS/MSD analysis was not conducted on any project sample for this SDG, however a MS/MSD analysis was performed. All pesticides had %RPD between the columns <20% for all pesticides except: Endrin Aldeh (28.71% MS, 34.42% MSD, 40.26% MS-2, 43.88% MSD-2), Beta-Endosulfan (20.68%) MSD-2), and Gamma-Chlordane (25.03% MS-2 and 20.87% MSD-2).		No action was taken based on MS/MSD results alone.
PCBs				
R0905678	S12EXSW-I-3-02	Aroclor-1260 had %Rec above the limit for both the MS (241%) and MSD (208%), but the RPD was within the limits (15%). All PCBs had %RPD between the columns <20% for all PCBs except for column DB-17, which had a MS (43.6%) and MSD (26.8%).	All soil samples in the SDG	No action was taken since all PCB results were non-detect.
R0905778		MS/MSD analysis was not conducted on any project sample for this SDG, however a MS/MSD analysis was performed. All PCBs had %RPD between the columns <20% for all PCBs.		No action was taken based on MS/MSD results alone.
R0905818	S12EXSW-O-8-05	The MS and MSD %Rec were within limits (98% and 69%, respectivitly), however the %RPD between the MS and MSD was 35%, which is above the lab limt (30%).	S12EXSW-O-8-05	No action was taken based on MS/MSD results alone.
Metals				
R0904203	S12EXPR-B-2-01	Post digestion spike had low recovery for Se (70.6%).	S12EXPR-B-2-01	No action was taken based on the post digestion spike results.
R0904258	S12EXPR-O-8-03	All spike metal recoveries were within the limits and did not have a initial conc >4x spike conc except Antimony (51%).	All soil samples in the SDG	Qualify all Antimony results > MDL as J.
R0904367	S12EXSW-D-2-01	All spike metal recoveries were within the limits and did not have a initial conc >4x spike conc except Potassium (73%) and Antimony (73%).	All soil samples in the SDG	Qualify all Potassium and Antimony results as J.
R0904422	S12STOCK-C1-11	All spike metal recoveries were within the limits and did not have a initial conc >4x spike conc except Lead (72%) and Antimony (70%).	S12STOCK-C1-11	Qualify sample S12STOCK-C1-11 Lead and Antimony results as J.
R0904596		A spike sample analysis was not performed for this SDG	All soil samples in the SDG	Qualify all metals and cyanide results as J since they were not analyzed as part of the spike sample.
R0905778	S12EXFL-J-2-02	A spike sample analysis was not performed on all metals except Hg for this SDG	All soil samples in the SDG	Qualify all metals except mercury as J since they were not analyzed as part of the spike sample.

Table G-3
Summary of Spike Analysis Results
Construction Completion Report for SEAD-12
Seneca Army Depot Activity

SDG	Spiked Sample	Noncompliance	Sample Affected	Action
Pesticides				
R0905678		MS/MSD analysis was not conducted on any project sample for this SDG, however a MS/MSD analysis was performed. All pesticides had %RPD between the columns <20% for all pesticides.		No action was taken based on MS/MSD results alone.
PCBs				
R0905678		MS/MSD analysis was not conducted on any project sample for this SDG, however a MS/MSD analysis was performed. All PCBs had %RPD between the columns <20% for all PCBs.		No action was taken based on MS/MSD results alone.
Metals				
R0905678		A spike sample analysis was not performed for this SDG	All soil samples in the SDG	Qualify all metals and cyanide results as J since they were not analyzed as part of the spike sample.
Life Science Labarotories				
Soil Matrix				
SVOC				
910067	S12EXFL-4-3-01	%Rec met requirements except: 1,2-Dichlorobenzene (19% MS with 121% RPD), 1,3-Dichlorobenzene (12% MS with 141% RPD), 1,4-Dichlorobenzene (14% with 136% RPD), 2,2'-oxybis(1-Chloropropane) (75% RPD), Bis(2-Chloroethyl)ether (32% MS with 86% RPD), Bis(2-Chloroisopropyl)ether (36% MS with 75% RPD), Hexachlorobutadiene (36% MS with 71% RPD), Hexachloroethane (14% MS), and N-Nitrosodimethylamine (8% MS).		No action was taken based on MS/MSD results alone.
Pesticides				
910067	S12EXFL-4-3-01	Analysis Run #18587. All pesticides had %Rec within the lab limits except: 4,4'-DDD (135% MS with 51% RPD), 4,4'-DDT (179% MS with 73% RPD), Aldrin (391% MS with 115% RPD), and Alpha-BHC (239% MS with 68% RPD) were above the lab limit; Gamma-Chlordane (28% RPD) was above the lab limit; and Endrin Aldehyde (0% MS), Heptachlor (0% MS), and Heptachlor Epoxide (0% MS) were below the lab limit.		No action was taken since recoveries were not outisde the limits for both the MS and MSD.
910067	S12EXFL-4-3-01	Analysis Run #18588. All pesticides had %Rec within the lab limits except: 4,4'-DDE (154% MS with 61% RPD), 4,4'-DDT (262% MS with 102% RPD), Alpha-BHC (227% MS with 66% RPD), Beta-BHC (135% MSD), Gamma-Chlordane (212% MS with 87% RPD), Heptachlor (245% MS), and Heptachlor Epoxide (150% MS) were above the lab limit; and Beta-BHC (0% MS) and Endrin Aldehyde (0% MS) were below the lab limit.		No action was taken since recoveries were not outisde the limits for both the MS and MSD.
PCBs				
910067	S12EXFL-4-3-01	The MS/MSD results for Aroclor-1016 (0%) %Rec was below the lab limit. Aroclor-1016 and Aroclor-1260 had %RPD between the columns <20%.		No action was taken based on the MS/MSD results alone.
Metals				
910067	S12EXFL-4-3-01	All spike metal recoveries were within the limits and did not have a initial conc >4x spike conc except Antimony (33% MS, 29% MSD).	All soil samples in the SDG	Qualify Sb results as J.

Table G-4
Summary of Laboratory Control Sample Results
Construction Completion Report for SEAD-12
Seneca Army Depot Activity

SDG	Noncompliance	Sample Affected	Action
VOC			
R0904367	2nd LCS recovery for Acetone (137%) and Methyl Ethyl Ketone (133%) were above project limit but within lab limit.		No action was taken since recovery was within the laboratory limit.
Metals			
R0904203	LCS for Sb above 120% at 157.8% and 152%		Sb was found within the lab limits; therefore no action was taken.
R0904258	LCS for Sb above 120% at 145%		Sb was found within the lab limits; therefore no action was taken.
R0904367	LCS for Sb above 120% at 152% and 131%		Sb was found within the lab limits; therefore no action was taken.
R0904422	LCS for Sb and Fe were both above 120% at 146%		Sb and Fe were found within the lab limits; therefore no action was taken.
R0904596	LCS for Sb above 120% at 150.8%		Sb was found within the lab limits; therefore no action was taken.
R0905678	LCS for Sb above 120% at 169%		Sb was found within the lab limits; therefore no action was taken.
R0905778	LCS for Sb above 120% at 151%		Sb was found within the lab limits; therefore no action was taken.

Table G-5
Summary of Surrogate Noncompliance Results
Construction Completion Report for SEAD-12
Seneca Army Depot Activity

SDG	Samples	Description	Qualification
Pesticide			
R0905778	S12EXSW-I-2-03 (1st analysis)	tetrachloro-m-xylene recovery was 18%.	Re-analysis of S12EXSW-I-2-03 was within limits, no action was taken.
PCB			
R0904258	S12EXPR-O-8-01 (re-analysis)	Surrogates decachlorobiphenyl recovery (148%) was above lab limit 146%, but within Region 2 <150% limit.	No action was taken, since recovery was within project limits.
R0904258	S12DS04	decachlorobiphenyl (DCB) and tetrachloro-m-xylene (TCMX) recoveries were 0%.	No action was taken, since dilution factor was 100x.
R0905678	S12EXFL-I-3-01, S12EXSW-I-3-01, S12EXSW-I-3-02, and S12EXSW-I-3-03	Surrogate recoveries above the 150% limit were S12EXFL-I-3-01 for DCB (151%), S12EXSW-I-3-01 for TCMX (151%) and DCB (154%), S12EXSW-I-3-02 for TCMX (181%), and S12EXSW-I-3-03 for TCMX (163%) and DCB (156%)	Qualify detects as J for samples S12EXSW-I-3-01 and S12EXSW-I-3-03.
R0905778	S12EXSW-I-2-03 (1st analysis)	tetrachloro-m-xylene recovery was 23%.	Re-analysis of S12EXSW-I-2-03 was within limits, no action was taken.

Construction Completion Report for SEAD-12
Seneca Army Depot Activity

Sample	SDG	Noncompliance TCLs/TALs	Action
Columbia Analytical Services			
Soil matrix			
		Field Duplicate	
VOC			
S12EXSW-D-2-01/2	R0904367	Acetone and Toluene were detected in at least one of the samples.	Acetone %RPD = 57% due to low detected concentrations, qualify results as J. Toluene %RPD = 132% was due to a detect and non-detect results, no action was taken.
SVOC			
S12EXFL-I-3-01/2	R0904203	Pair S12EXFL-I-3-01/2 %RPD results were within the limits for most of the analytes, however Bis(2-Ethylhexyl)phthalate (132%) had RPD's >50%. Bis(2-Ethylhexyl)phthalate was detected in the parent samples (76 J), but non-detect (370 U) at difference concentrations.	Qualify Bis(2-Ethylhexyl)phthalate results in both samples as J.
S12EXPR-O-8-03/4	R0904258	The %RPD results were within the limits for most of the analytes, however Benzyl Alcohol (106%) had RPD's >50%. Benzyl Alcohol was detected in the parent samples (120 BJ), but non-detect (390U) at difference concentrations.	Qualify Benzyl Alcohol results in both samples as J.
S12EXSW-D-2-01/2	R0904367	The %RPD results were within the limits for most of the analytes, however the following analytes had RPD's >50%: Benzyl Alcohol (110%) and Bis(2-Ethylhexyl) Phthalate (150%). Bis(2-Ethylhexyl) Phthalate was detected in one sample and non-detect in the other . Benzyl Alcohol was detected in both samples but at difference concentrations (38 J and 130 J).	Qualify both analytes results in both samples as J.
S12STOCK-C1-11/12	R0904422	The %RPD results were within the limits for most of the analytes, however the following analytes had RPD's >50%: Anthracene (155%), Benzo(a)anthracene (-92%), Benzo(a)pyrene (-87%), Benzo(b)fluoranthene (104%), Benzo(k)fluoranthene (117%), Bis(2-Ethylhexyl) Phthalate (138%), Chrysene (-84%), Fluoranthene (-111%), Indeno (1,2,3-cd)pyrene (131%), and Pyrene (-107%). The following analytes were detected in one sample and non-detect in the other: Anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Bis(2-Ethylhexyl) Phthalate, and Indeno (1,2,3-cd)pyrene. The remaining analytes were detected in both samples but at difference concentrations.	Qualify all results for the above analytes as J.
Metals			
S12EXPR-O-8-03/4	R0904258	All metal %RPD results were within limit %RPD < 50% or Abs Diff < 2xCRDL except Calcium.	Qualify Ca results as J for both samples.
S12STOCK-C1-11/12	R0904422	All metal %RPD results were within limit except lead (67%).	Qualify both samples Lead results as J.

Table G-8
Summary of Noncompliance Results for Parent/Field Duplicate Samples
Construction Completion Report for SEAD-12
Seneca Army Depot Activity

Sample	SDG	Noncompliance TCLs/TALs	Action
S12EXPR-O-8-03	R0904258	MS/MSD %RPD was outisde the limits for 2-Hexanone (Methyl butyl ketone) (9% MS, 4% MSD w %RPD 74%), Methyl isobutyl ketone (19% MS, 9% MSD w %RPD 67%)	Qualify sample S12EXPR-O-8-03 2-Hexanone (Methyl butyl ketone) and Methyl isobutyl ketone results as J.
S12EXFL-O-8-01	R0904596	%Rec met requirements except for Acetone (158% MS, 347% MSD) with a %RPD = 75%.	Qualify sample S12EXFL-O-8-01 Acetone detect as J.
S12EXSW-I-3-02	R0905678	%RPD met requirements except Bromomethane (32%).	No action was taken based on the MS/MSD %RPD results alone.
SVOC			
S12EXFL-I-3-01	R0904203	MS/MSD %Rec and %RPD met requirements except Hexachlorocyclopentadiene (%RPD = 72%).	No action was taken based on the MS/MSD results alone.
S12EXSW-I-3-02	R0905678	The %RPD's were above 50% for all SVOC parameters except 2,4-Dinitrophenol.	No action was taken based on the MS/MSD results alone.
Pesticide			
S12STOCK-C1-11	R0904422	Endrin Ketone (139% MS, 341% MSD with RPD 84%)	Qualify sample S12STOCK-C1-11 results for Endrin Ketone as J.
PCB			
S12EXSW-I-3-02	R0905678	Column DB-17 had a %RPD for the MS (43.6%) and MSD (26.8%) for Aroclor-1260	No action was taken since all PCB results were non-detect.
S12EXSW-O-8-05	R0905818	The MS and MSD %Rec were within limits (98% and 69%, respectivitly), however the %RPD between the MS and MSD was 35%, which is above the lab limt (30%).	No action was taken based on MS/MSD results alone.
Metals			
S12EXFL-I-3-01	R0904203	For S12EXFL-I-3-01 all metals had %RPD < 35% except Ca (53%) and Mg (80%).	qualify all Ca and Mg results => CRDL as J
S12STOCK-C1-11	R0904422	The following metals have %RPD > 35%: calcium (78%) and lead (65%).	Qualify sample S12STOCK-C1-11 Ca and Pb results as J.
NA	R0904596	A laboratory duplicate analysis was not performed for this SDG. There was only one sample in the SDG.	Qualify all results as J since lab duplicate analysis was not performed.
Life Science Labarotories			
Soil matrix			
		Field Duplicate	
VOC			
S12EXFL-I-4-01/2	910067	The %RPD results were within the limits for most of the analytes, however Methylene Chloride (156%) had RPD's >50%. Methylene Chloride was detected in the parent samples (0.64 J), but non-detect (5.2 U) at difference concentrations.	Qualify Methylene Chloride results in both samples as J.
SVOC			
S12EXFL-I-4-01/2	910067	The %RPD results were within the limits for most of the analytes, however Bis(2-Ethylhexyl)phthalate (159%) had RPD's >50%. Bis(2-Ethylhexyl)phthalate was detected in the parent samples (42 J), but non-detect (370 U) at difference concentrations.	Qualify Bis(2-Ethylhexyl)phthalate results in both samples as J.

SDG	Noncompliance	Calibration	Sample Affected	Action
Columbia Analytical Services				
Soil matrix				
VOC				
R0904203	SDG was outside the %RSD criteria for Nitrobenzene (25.3%). All RRFs were within the limits except: Isobutyl Alcohol (0.035) and 1,4-Dioxane (0.006)	ICV on 7/20/09	All soil samples in the SDG	Nitrobenzene, Isobutyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904203	%Ds were within the Method 8260B QC limit of 20% for all target compounds except: Chloromethane (-23.4%), Acrolein (-45.7%), Iodomethane (-26.8%), Carbon Disulfide (-25.4%), Vinyle Acetate (-39.1%), N-Heptane (26.4%), 4-Methyl-2-Pentanone (-20.6%), 2-Hexanone (-22.4%), 1,1,2,2-Tetrachloroethane (-21%), 1,2,3-Trichloropropane (-22.4%), 2-Chlorotoluene (-24.5%), and Hexachlorobu (25.6%). RRFs were within the limit except: Iso-Butyl Alcohol (0.038) and 1,4-Dioxane (0.007).	CCV (instrument MS #7) on 7/31/09 at 11:05	S12EXFL-B-2-01, S12EXFL-C-2-01, S12EXFL-E-1-01, S12EXPR-B-1-01, and S12EXFL-J-4-01	All of the above analytes except Chloromethane, Carbon Disulfide, 4-Methyl-2-Pentanone, 1,1,2,2-Tetrachloroethane, and 2-Hexanone were not reported in the results and therefore do not require action. Qualify Chloromethane, Carbon Disulfide, 4-Methyl-2-Pentanone, 1,1,2,2-Tetrachloroethane, and 2-Hexanone results as J.
R0904203	%Ds were within the Method 8260B QC limit of 20% for all target compounds. RRFs were within the limit except: Iso-Butyl Alcohol (0.038) and 1,4-Dioxane (0.006)	CCV (instrument MS #7) on 8/3/09 at 13:07	S12EXPR-E-1-01, S12EXPR-C-1-01, S12EXPR-C-2-01, S12EXPR-d-1-01, S12EXFL-I-3-02, S12EXFL-I-3-01, and S12EXPR-I-3-01	Iso-Butyl Alcohol and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904203	%Ds were within the Method 8260B QC limit of 20% for all target compounds except Dichlorodifluoromethane (21.1%), 1,1-Diclethane (20.7%), and N-Heptane (25%). RRFs were within the limit except: Iso-Butyl Alcohol (0.035) and 1,4-Dioxane (0.006).	CCV (instrument MS #7) on 8/4/09 at 16:57	S12EXPR-J-2-01, S12EXPR-J-3-01, S12EXPR-J-4-01, S12EXPR-J-4-02, S12EXPR-J-4-03, S12EXPR-J-5-01, S12EXPR-K-3-01, S12EXPR-K-4-01, S12EXPR-D-2-01, S12EXPR-B-2-01, and S12EXPR-B-2-02	Dichlorodifluoromethane, 1,1-Diclethane, N-Heptane, Iso-Butyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904203	%Ds were within the Method 8260B QC limit of 20% for all target compounds except Freon 113 (20.4%) and N-Heptane (20.1%). RRFs were within the limit except: Iso-Butyl Alcohol (0.032) and 1,4-Dioxane (0.006).	CCV (instrument MS #7) on 8/5/09	S12EXFL-K-3-01 and S12EXPR-I-2-01	Freon 113, N-Heptane, Iso-Butyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904203	RRFs were within the limit except: Iso-Butyl Alcohol (0.039) and 1,4-Dioxane (0.007).	CCV (instrument MS #7) on 8/7/09 at 10:51	S12EXPR-A-2-01	Iso-Butyl Alcohol and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904258	SDG was outside the %RSD criteria for Nitrobenzene (25.3%). All RRFs were within the limits except: Isobutyl Alcohol (0.035) and 1,4-Dioxane (0.006).	ICV on 7/20/09	All soil samples in the SDG	Nitrobenzene, Isobutyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904258	%Ds were within the Method 8260B QC limit of 20% for all target compounds except: Acetonitrile (20.7%), N-Heptane (20.5%), and Cyclohexanone (73.9%). RRFs were within the limit except: Iso-Butyl Alcohol (0.030) and 1,4-Dioxane (0.006)	CCV (instrument MS #7) on 8/6/09 at 00:21	S12EXFL-N-9-01, S12EXFL-N-9-02, S12EXFL-O-10-01, S12EXPR-N-10-01, S12EXPR-N-10-02, S12EXPR-N-9-01, S12EXPR-O-10-01, S12EXPR-O-8-03, S12EXPR-O-7-01, and S12-STOCK-C1-01	Acetonitrile, N-Heptane, Cyclohexanone, Isobutyl Alcohol and 1,4-Dioxane were not reported in the results and therefore do not require action.

Table G-10
Summary of Calibration Noncompliance Results
Construction Completion Report for SEAD-12
Seneca Army Depot Activity

SDG	Noncompliance	Calibration	Sample Affected	Action
R0904258	%Ds were within the Method 8260B QC limit of 20% for all target compounds except: Iodomethane (-27%) and Hexachlorobu (20.6%). RRFs were within the limit except: Acrolein (0.027), 2-Propanol (0.014), Acetonitrile (0.02), TBA (0.02), Vinyl Acetate (0.044), Propionitrile (0.035), Iso-Butyl Alcohol (0.007), 1,4-Dioxane (0.001), and Cyclohexanone (0.04)	CCV (instrument MS #7) on 8/6/09 at 10:49	S12EXPR-O-8-01, S12EXPR-O-8-02, and S12EXPR-O-8-04, S12EXPR-O-9-01	Iodomethane and Hexachlorobu were not reported in the results and therefore do not require action. Acrolein, 2-Propanol, Acetonitrile, TBA, Vinyl Acetate, Propionitrile, Iso-Butyl Alcohol, 1,4-Dioxane, and Cyclohexanone were not reported in the results and therefore do not require action.
R0904258	RRFs were within the limit except: Iso-Butyl Alcohol (0.035) and 1,4-Dioxane (0.006).	CCV (instrument MS #7) on 8/6/09 at 13:30	No project samples were analyzed after the CCV.	Iso-Butyl Alcohol and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904367	SDG was outside the %RSD criteria for Methyl Bromide (29.6%) and Iodomethane (42%). All RRFs were within the limits except: Vinyl Acetate (0.045), Isobutyl Alcohol (0.023), 1,4-Dioxane (0.003)	ICV on 8/6/09	All soil samples in the SDG	Iodomethane, Vinyl Acetate, Isobutyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action. Qualify Methyl Bromide results as J.
R0904367	%Ds were within the Method 8260B QC limit of 20% for all target compounds except: Methyl Bromide (-20.9%), Acetone (-22.7%), Iodomethane (23.7%), Methyl Acetate (-29.7%), Acrylonitrile (-20.8%), and Tetrahydrofuran (-23.2%). RRFs were within the limit except: Vinyl Acetate (0.045), Iso-Butyl Alcohol (0.027), and 1,4-Dioxane (0.003).	CCV (instrument MS #12) on 8/7/09 at 12:51	S12EXSW-A-2-01, S12EXSW-B-1-01, S12EXSW-B-2-01, S12EXSW-C-1-01, S12EXSW-C-2-01, S12EXSW-D-1-01, S12EXSW-D-2-01, S12EXSW-E-1-01, S12EXSW-I-2-01, S12EXSW-I-3-01, S12EXSW-J-2-01, S12EXSW-J-3-01, S12EXSW-J-3-02, S12EXSW-J-4-01	The results for Methyl Bromide and Acetone in all samples were qualified (nondetects were qualified UJ and detects were qualified J). Vinyl Acetate, Isobutyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904367	%Ds were within the Method 8260B QC limit of 20% for all target compounds except: Iodomethane (24.2%), Methyl Acetate (63.5%), 2-Chloroethylvinyl Ether (95.7%), and 1,2,4-Tcbenzene (20.0%). RRFs were within the limit except: Vinyl Acetate (0.037), Iso-Butyl Alcohol (0.026), and 1,4-Dioxane (0.003).	CCV (instrument MS #12) on 8/8/09 at 02:12	S12EXSW-J-4-02, S12EXPR-J-3-02, S12EXSW-J-4-03, S12EXSW-J-5-01, S12EXSW-K-3-01, S12EXSW-K-4-01, S12EXSW-D-2-02, S12EXSW-N-10-01, S12EXSW-N-10-02, S12EXSW-N-9-01, S12EXSW-O-10-01, S12EXSW-O-7-01, S12EXSW-O-8-01, S12EXSW-O-8-02, S12EXSW-O-8-03, and S12EXSW-O-9-01.	Iodomethane, Methyl Acetate, 2-Chloroethylvinyl Ether, and 1,2,4-Tcbenzene were not reported in the results and therefore do not require action. Vinyl Acetate, Isobutyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action.
R0904422	SDG was outside the %RSD criteria for Methyl Bromide (29.6%) and Iodomethane (42%). All RRFs were within the limits except: Vinyl Acetate (0.045), Isobutyl Alcohol (0.023), 1,4-Dioxane (0.003).	ICV on 8/6/09	All soil samples in the SDG	Iodomethane, Vinyl Acetate, Isobutyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action. Qualify Methyl Bromide results as J.

Table G-10
Summary of Calibration Noncompliance Results
Construction Completion Report for SEAD-12
Seneca Army Depot Activity

SDG	Noncompliance	Calibration	Sample Affected	Action
R0904422	%Ds were within the Method 8260B QC limit of 20% for all target compounds except: Acetone (-22.7%), Iodomethane (28.5%), Methyl Acetate (-27.5%), TBA (-21.1%), Acrylonitrile (-22.6%), Iso-Butyl Alcohol (-26.1%), 2-Chloroethylvinyl Ether (90.3%), and Methyl butyl ketone (-24%). RRFs were within the limit except: Vinyl Acetate (0.039), Iso-Butyl Alcohol (0.029), 1,4-Dioxane (0.003), and 2-Choroethylvinyl Ether (0.018).	CCV (instrument MS #12) on 8/10/09 at 12:08	S12STOCK-C1-02, S12STOCK-C1-03, S12STOCK-C1-04, S12STOCK-C1-05, and S12STOCK-C1-06	The results for Methyl butyl ketone and Acetone in all samples were qualified (nondetects were qualified UJ and detects were qualified J). Vinyl Acetate, Isobutyl Alcohol, 1,4-Dioxane, and 2-Choroethylvinyl Ether were not reported in the results and therefore do not require action.
R0904596	SDG was outside the %RSD criteria for Iodomethane (28.24%) and 2-Chloroethylv (28.79%). All RRFs were within the limits except: Acetonitrile (0.049), Isobutyl Alcohol (0.026), 1,4-Dioxane (0.004), and 2-Chloroethylv (0.046)	ICV on 8/19/09	All soil samples in the SDG	Iodomethane, Acetonitrile, Isobutyl Alcohol, 1,4-Dioxane, and 2-Chloroethylv were not reported in the results and therefore do not require action.
R0904596	%Ds were within the Method 8260B QC limit of 20% for all target compounds except: Iodomethane (28.8%), Carbon Disulfide (22.4%), and 1,4-Dioxane (-25%).	CCV (instrument MS #7) on 8/19/09 at 12:13	All soil samples in the SDG	Iodomethane and 1,4-Dioxane results were not reported. The results for Carbon Disulfide in all samples were qualified (nondetects were qualified UJ and detects were qualified J).
R0905678	SDG was outside the %RSD criteria for Acetone (36.7%RSD) and Tetrahydrafuran (21.7%RSD). All RRFs were within the limits except: Vinyl Acetate (0.046), Isobutyl Alcohol (0.025), 1,4-Dioxane (0.004).	ICV on 9/13/09	All soil samples in the SDG	Tetrahydrafuran, Vinyl Acetate, Isobutyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action. Qualify Acetone results as J.
R0905678	%Ds were within the Method 8260B QC limit of 20% for all target compounds except: Iodomethane (30.1%), 1,4-Dioxane (-25%), 2-Chloroethylvinyl Ether (55.4%), 4-Methyl-2-Pentanone (MIBK) (20.6%), Butyl Acetate (22.1%), 1,1,1,2-Tetrachloroethane (20.4%), 1,3,5-Trimethylbenzene (20.7%), tert-Butylbenzene (23.3%), 1,2-Dibromo-3-chloropropane (22.9%), Nitrobenzene (28.5%), Hexachlorobu (31.6%), Naphthalen (23.9%), and 1,2,3-Tclbenzene (23.8%).	CCV (instrument MS #7) on 10/10/09 at 12:10	All soil samples in the SDG	The results for 4-Methyl-2-Pentanone (MIBK) in all samples were qualified (nondetects were qualified UJ and detects were qualified J).
R0905778	SDG was outside the %RSD criteria for Acetone (36.7%RSD) and Tetrahydrafuran (21.7%RSD). All RRFs were within the limits except: Vinyl Acetate (0.046), Isobutyl Alcohol (0.025), 1,4-Dioxane (0.004).	ICV on 9/13/09	All soil samples in the SDG	Tetrahydrafuran, Vinyl Acetate, Isobutyl Alcohol, and 1,4-Dioxane were not reported in the results and therefore do not require action. Qualify Acetone results as J.

John Nohrstedt, USACE, CEHNC

SUBJECT: Update of SEAD-12 Historic Disposal Pit Risk Assessment, Seneca Army Depot Activity

1.0 Purpose and Organization of Memorandum

Parsons Infrastructure & Technology Group Inc. (Parsons) has prepared an update to the baseline human health risk assessment previously prepared for SEAD-12, the Radiological Waste Burial Sites, as part of the remedial investigation (RI) in 2002 (Parsons, 2002). The update was conducted to assess whether changes in carcinogenic risk or non-carcinogenic hazard levels result due to the collection of new soil data from the Disposal Pits (Pits A, B, C1 and C2) excavated by the Army during the summer and fall of 2009 to recover military-related items and other forms of debris that were buried during the Army's ownership and occupation of the property.

After the Seneca Army Depot Activity (SEDA or the Depot) was listed as a National Priorities List (NPL) Site by EPA, the Army identified two areas within the former Weapons Storage Area (WSA) of the Depot as locations where hazardous substances had been handled, and where releases to the environment may have occurred. These areas were generally described as Radiological Waste Burial Pits and were designated as SEAD-12A (area north of Building 813) and SEAD-12B (area north of building 804). Geophysical investigations conducted as part of the Expanded Site Inspection identified the locations of the suspected burial pits at SEAD-12A and SEAD-12B. The geophysical investigation of SEAD-12A suggested there were four areas, initially identified as Areas 1 - 4, located within the northeastern corner of the former WSA where burial pits were likely to exist. Burial pit locations 1 - 4 subsequently were designated as Disposal Pit A, B, C2, and C1, respectively, during continuing site investigations. Subsequent to the identification of the suspected burial pits, test pits were dug to characterize materials that were contained in the pits, and soil, sediment, surface water,

and groundwater were collected from the region around the four identified burial areas, and the results obtained from the analysis of these samples suggested that there were hazardous substances present. Based on these data and results, the Army developed plans for a larger scaled remedial investigation of the burial sites.

During the planning stages of the RI for SEAD-12A and SEAD-12B, the Army conducted reviews of information and data contained in Depot files, and concluded that other areas within the greater WSA also had the potential to be locations where materials equivalent to those identified in SEAD-12A and SEAD-12B had been historically handled. Based on this determination, the Army expanded the scope of the RI beyond the bounds of SEAD-12A and SEAD-12B and conducted extensive geophysical, chemical, and radiological investigations of the land within the greater WSA. The expanded investigation of the WSA resulted in the Army's decision to re-define SEAD-12 as a 360 acre site that extended from a southern boundary line, set just north of the Row A0300 storage igloos, outwardly to the western, northern, and eastern perimeter security fences surrounding the WSA, exclusive of land previously designated as SEAD-63 (the Miscellaneous Component Burial Site) that is located roughly halfway up the western border of WSA.

The results of the RI for SEAD-12 indicated there were nine subareas of SEAD-12 that exhibited varying levels for potential hazardous substance release. These nine areas were identified as:

- Building 819 and EM-27;
- Building 815, Building 816, and EM-28;
- Disposal Pits A/B (a portion of the former SEAD-12A including burial pit areas 1 and 2, re-designated as Disposal Pit A and B);
- Disposal Pit C (a portion of former SEAD-12A including burial pit areas 3 and 4, re-designated as C2 and C1);
- Dry Waste Disposal Pit (former SEAD-12B);
- EM-5;
- EM-6;
- Open areas; and
- Building 715 Wastewater Treatment Plant.

At the conclusion of the RI, the Army prepared human health and ecological risk assessments for three of the nine areas identified in SEAD-12. These areas included Disposal Pit A/B, Disposal Pit C, and the Former Dry Waste Disposal Pit (previously designated as SEAD-12B). "These three areas were selected on the basis of site evaluation criteria including areas of documented activity associated with WSA activities; areas where RI investigations (geophysical and test pitting operations) confirmed significant 'military' activity, and proximity to buildings associated with activities of potential concern. Overall, the Former Dry Waste Disposal Pit area, Disposal Pits A/B, and Disposal

Pit C were impacted to the greatest extent by former activities in the Former Weapons Storage Area (SEAD-12)"[1].

In the summer and fall of 2009, the Army excavated the historic burial pits areas 1 – 4 (re-designated as A, B, and C including C2 [ESI area 3], and C1 [ESI area 4], respectively) to provide access to materials that were previously buried at the sites. The goal of this work was to allow the Army to recover, secure, demilitarize, and dispose of any military-related items that were present in the burial pits to ensure that they could not be accessed by future users/owners of the SEAD-12 property. During the recovery of the military-related items and other debris that was found in the historic burial pits approximately 5,400 cubic yards of material was excavated. After the military-related items and other debris were separated from the soil and fill that surrounded it, soil samples were collected and analyzed and the resulting data were used to assess if any of the excavated soil/fill could be re-used as backfill at the excavation sites. Based on the analysis of this data, approximately 2,300 cubic yards of soil was used as backfill at the locations of historic burial pits A and B. In addition, confirmatory soil samples were collected from the base, sidewall, and perimeter of all of the excavation sites to verify that unacceptable levels of residual risk did not remain at the sites.

The Army intends to transfer all of the land within SEAD-12, including the areas of the former Disposal Pits, for non-military reuse purposes. At present, a tenant is occupying some of the facilities within the bounds of SEAD-12 for commercial purposes, and this tenant has indicated that they may want to expand their operations in the future to include the land that is currently within the area where the historic burial pits were previously located. The Army has used the new analytical data developed from soil samples collected from the area of the historic disposal pits to update the previously accepted risk assessments for Disposal Pits A/B and C prepared during the RI.

All estimations of risk or hazards previously determined for human receptors exposed to groundwater, surface water, or sediment within the SEAD-12 site remain as they were reported in the 2002 *Remedial Investigation Report at the Radiological Waste Burial Sites* (RI Report, Parsons, 2002). No samples of these three media were collected during the SEAD-12 Removal Action, and thus the data has not changed.

Section 2 of this memorandum provides background information for the risk assessment, Section 3 identifies and presents the data used to update the soil exposure component of the previously accepted risk assessment, Sections 4 through 7 summarize each step of the four-step risk assessment process (i.e., hazard identification, exposure assessment, toxicity assessment, and risk characterization), Section 8 discusses the risk uncertainties associated with the risk assessment, section 9 lists reference materials used. Discussions presented in each of these sections focus only on changes that result due to the update of the location-specific soil datasets used.

[1] Section 6 "Human Health Risk Assessment", Page 6-1, 3rd paragraph, *Final Remedial Investigation Report at the Radiological Waste Burial Sites (SEAD-12)*, Parsons, August 2002.

2.0 Background

2.1 Site History

The former military facility was owned by the U.S. Government and operated by the Army between 1941 and 2000 when SEDA's military mission ceased. The Depot occupied approximately 10,600 acres of land in the towns of Varick and Romulus in Seneca County, New York. The Depot's historic military mission included receipt, storage, distribution, maintenance, and demilitarization of conventional ammunition, explosives, and special weapons.

In September 2000, the Army assumed the role of caretaker of the former Depot. As caretaker, the Army maintains control of the Depot's land until the time when parcels are transferred to new owners for alternate uses. Areas in the Depot that are subject to continuing investigation and remedial action under the requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), remain under the control of the Army. To date, more than 9,250 acres of the former Depot have been transferred to the Seneca County Industrial Development Agency (SCIDA), the State of New York, and other federal entities.

2.2 Areas of Concern

The historic radiological burial pits (Disposal Pit A, B, and C) are all located in the area previously designated as SEAD-12A, which is located in the northeastern portion of SEAD-12. SEAD-12A is bounded to the north and east by a high-security fence line and Patrol Road, to the south by a wooded area that is located to the north of Buildings 813/814 and 815 between the area's eastern security fence and Service Road No. 1, and to the west by a narrow, north-south oriented row of trees that are located roughly 200 feet east of Service Road No. 1. Prior to the removal action, land within SEAD-12A was classified as generally open and vacant, with intermixed areas that were either vegetated with grass, weeds, and scrub brush or free of vegetative cover.

During the summer and fall of 2009, the Army excavated the former disposal pit sites to gain access to, and to allow the inspection of, materials that had been disposed in the pits during the time of the Army's occupation and use of the land. The primary purpose of this work was to remove and dispose of military-related items that had been buried on site. Because of this work, approximately 5,400 cubic yards of material were excavated from the historic disposal pit sites. Of the total material excavated, approximately 13.25 tons of military-related items were recovered and secured by the Army, and disposed of as low-level radioactive waste at Energy Solutions, LLC in Utah. An additional 122 tons of assorted varieties of scrap metal were recovered and sent to a metals recycler for recovery. More than 5,400 tons of soil and fill material were also transported off-site and disposed at a licensed landfill, while approximately 2,300 cubic yards of the material excavated was used as backfill at the site.

During the excavation activities, the Army collected confirmatory soil data from each of the excavation sites and from the potential backfill material pile to characterize soils that remained at the historic burial pit locations after the completion of the removal action. Each of these soil samples was characterized for Target Compound and Target Analyte List (TCL/TAL, respectively)

contaminants of concern. Excavations at the historic disposal pit sites expanded if soil samples collected exterior of the debris caches from perimeter, sidewall, or excavation base locations indicated that elevated levels of contaminants of potential concern (COPCs) remained at the disposal sites. The excavations were terminated once debris was no longer found in the soil and fill material, and once soil samples indicated that TCL and TAL contaminant levels were consistent with State of New York unrestricted use soil cleanup objective (SCO) levels. In addition, stockpiled soil that was found to be consistent with New York's unrestricted use SCO levels was used to backfill some of the excavation sites.

3.0 Data Used for the Risk Assessment

3.1 Chemical Constituents

All soil data for chemical (non-radiological) constituents used to update the risk assessment calculations were validated by Parsons' chemists in accordance with US Environmental Protection Agency (USEPA) Region 2 Standard Operating Procedures (SOPs).

3.1.1 Soil Data – Disposal Pit A/B

All of the RI soil data previously included in the Disposal Pit A/B risk assessment dataset was evaluated on a location-by-location basis to determine if it was interior or exterior of the excavation sites. Analytical results from RI samples collected within the limits of the soil that was excavated and disturbed during the removal action were eliminated from the Pit A/B soil dataset and replaced by analytical results from confirmatory soil samples (i.e., perimeter, sidewall, excavation base) collected from excavations opened for Pit A and B and from soil samples collected from the Overburden/C1 stockpile of soils recovered from each of the four disposal pit excavations. A listing of the RI soil samples previously used for the Pit A/B risk assessment is presented in **Table 1**, along with information that indicates whether the data have been included with the new analytical results or removed from the updated risk assessment's dataset. The soil dataset used in the updated Disposal Pit A/B human health risk assessment is presented in **Attachment A**, **Table 1**. The Disposal Pit A/B dataset is evaluated as a single combined total soil dataset, which was used to estimate exposure point concentrations (EPCs) that were used throughout the evaluation. This is a departure from the prior RI risk assessment evaluation process in which only the construction worker was exposed to the total soil (i.e., surface and subsurface soil), while other human receptors were exposed to surface soils only. The decision to use this approach was made because the absolute depth of the soil samples is uncertain due to the Disposal Pit backfill and grading operations that were performed at the end of the removal action. The total soil was assumed accessible by all potential receptors evaluated in this risk assessment (construction workers, park workers, recreational child visitors, resident adults, and resident children).

3.1.2 Soil Data – Disposal Pit C

The historic RI dataset for Disposal Pit C was also reviewed as described above in the Pit A/B discussion to identify sample results that were located within the zone disturbed by the SEAD-12 Removal Action. **Table 1** also provides the specific list of soil samples previously used in the risk

assessment for Pit C that were eliminated from the dataset. These data were then eliminated from the updated dataset and replaced by analytical results developed for excavation confirmatory samples collected from Disposal Pits C1 and C2. Data from the Overburden/C1 stockpile samples were not included in this location specific dataset, as all of the Overburden/C1 soil was used as backfill in the area of Disposal Pit A/B once it was verified to be suitable for this purpose.

The soil dataset used in the updated Disposal Pit C human health risk assessment is presented in **Attachment B**, **Table 1**. The Disposal Pit C dataset was also evaluated as a single combined total soil dataset, which was used to estimate exposure point concentrations that were used throughout the evaluation. The total soil was assumed accessible by all potential receptors evaluated in this risk assessment (construction workers, park workers, recreational child visitors, resident adults, and resident children).

3.1.3 Datasets for other media (groundwater, surface water, and sediment)

Exposure point concentrations for surface water, sediment, and groundwater were derived from SEAD-12 site-wide data developed during the RI. Summaries of groundwater, surface water, and sediment exposure point concentrations used in this update of the risk assessment are presented in **Attachment D**, **Tables 1**, **2**, and **3**, respectively.

4.0 Hazard Identification

All contaminants that were detected in soil samples that remained in the vicinity of one of the removal action excavation sites (e.g., post excavation confirmatory soil sample, ESI or RI sample not removed during the removal action, backfill soil characterization sample, etc.) were evaluated for inclusion in the updated human health risk assessment that was performed for the Disposal Pit A/B and C sites.

Non-radiological (i.e., chemical) contaminants found in soil evaluated in this risk assessment (i.e., Contaminants of Potential Concern [COPCs]) were selected by comparing maximum detected concentrations (MDCs) left at an exposure point location (i.e., Disposal Pit A/B or C) with USEPA Regional Screening Level (RSLs) for residential soil (June 2011 Version). RSLs for carcinogenic chemical compounds were used at USEPA's listed value, which corresponds to a target cancer risk of 1×10^{-6}; comparator RSLs for non-carcinogenic chemical compounds were reduced by a factor of 10 (i.e., 0.1 times the listed RSL value), which corresponds to a hazard quotient of 0.1. Chemicals with concentrations below the comparator RSLs were eliminated from the list of COPCs evaluated in the updated risk assessments. Chemicals with no available screening values and chemicals with maximum detected concentrations above the screening values were considered COPCs. In addition, all members of a chemical class that had any one member selected as a COPC were considered COPCs (e.g., all detected carcinogenic polycyclic aromatic hydrocarbons [cPAHs] were retained as COPCs if any one cPAH was identified as a COPC based on the aforementioned screening process).

Fifty-six (56) soil contaminants, including 10 VOCs, 19 SVOCs, five pesticide/PCBs and 22 metals were initially evaluated as COPCs for Disposal Pit A/B. The maximum concentration for each COPC was then compared to the appropriate residential soil RSL value (i.e., full value for carcinogenic

compound or 0.1 times the non-carcinogenic residential soil RSL value) and if the maximum concentration remaining at the site exceeded the RSL comparator value, the compound was retained for further evaluation during the risk assessment. Based on this determination, three cPAHs and seven metals were initially retained as COPCs, and due to the selection of three of the cPAHs, four other cPAHs that were also detected in the soil at Disposal Pit A/B, but which were not observed to exceed screening values, were also retained as "chemicals of the same group" (CSG) for further evaluation in the risk assessment. In addition, three other SVOCs and four other metals were also retained for further evaluation under the risk assessment based on the determination that no comparator RSL screening value existed for them. The soil screening results for Disposal Pit A/B are summarized in **Attachment A**, **Table 2**.

Data for the identified metal COPCs were then compared to SEDA background soil concentrations found for the same metals to assess whether there was any indication that the metals found at the disposal pit excavation site could be attributed to the release of material from activities historically conducted in the area of concern (AOC), or could be associated with natural conditions. This comparison had been used and allowed during the risk assessment performed during the 2002 RI, and was repeated in the update to ensure that data considered in both risk assessments were equivalent. The comparison to background was performed using the Wilcoxon Mann-Whitney (WMW) Test, which is provided in the USEPA's ProUCL Software package (version 4.01.00). This analysis procedure was used in place of the Wilcoxon Rank Sum test that was applied to the SEAD-12 datasets during the SEAD-12 RI.

The WMW test is a non-parametric statistical procedure used for determining whether a difference exists between site and background population distributions. The WMW Test tests whether measurements from one population tend to be larger or smaller than those found in the other population on the assumption that the dispersion of the two sample population distributions is roughly the same. The procedure determines which distribution is higher by comparing the relative ranks of the two datasets when the data from both sets are sorted and rank-ordered in a single list. The underlying assumption in the WMW test is that any difference between background and site concentration distributions results due to a shift in the sample population's mean or median that is attributable to the presence of site-specific contamination adding to background levels.

The hypotheses used in the application of the WMW test are:

H_o (the null hypothesis):	The populations from which the two data sets have been drawn have the same mean.
H_a (the alternative hypothesis):	The measurements from the site population tend to exceed those from the background populations.

where H_o is assumed true unless the test indicates H_o should be rejected in favor of H_a. If H_o cannot be rejected, then it is accepted that the distribution of measurements in the background area is very similar in shape and central tendency (average) to the distribution of measurements in the area being investigated. The WRS test does not require that either data set by normally distributed.

The results of the WMW Test for the 11 metals retained after the comparison to RSL values are summarized in **Attachment A**, **Table 3**. As is reflected in this table, the residual metal concentration statistic (i.e., Mean WMW Value) for six of the 11 retained metals is lower than the comparable value reported sample concentrations in the SEDA background dataset. Therefore, the identified concentrations of these six metals in the vicinity of Disposal Pit A/B cannot be distinguished from background concentrations and there is no indication that a release has occurred at the site. The WMW analysis results for four other metals (i.e., calcium, potassium, selenium, and thallium) indicate that levels of these metals found in the vicinity of former Disposal Pit A/B are higher than those identified in the background soil; therefore, these are retained for further analysis under the risk assessment. The WMW results for sodium provided conflicting information as the results indicate that all of the tested hypotheses (i.e., site equals background, site greater than or equal to background, site less than or equal to background) were true. However, since it is not mathematically possible for two datasets to be greater than and less than each other at the same time it is assumed that the sodium concentrations found at Disposal Pit A/B and the background are equal, and that no release of sodium is likely to have occurred at Disposal Pit A/B. Therefore, based on risk assessment pre-screening and background evaluations, 14 COPCs (i.e., 10 SVOCs, four metals) were evaluated for soil in the updated risk assessment for Disposal Pit A/B.

Fifty-eight (58) soil contaminants, including nine VOCs, 18 SVOCs, seven pesticides, and 24 metals/cyanide were initially evaluated as potential COPCs for Disposal Pit C. Again, the maximum concentration detected for each of the contaminants at Disposal Pit C was compared to the appropriate residential soil RSL value (i.e., full value or 0.1 time soil RSL value, as appropriate) and the compound was retained for further evaluation in the risk assessment if the maximum exceeded the screening value. Based on this determination, four cPAHs, one organochlorine pesticide and nine metals were retained as COPCs. Four other SVOCs, one organochlorine pesticide, and four metals were also retained for further evaluation based on the determination that no comparator RSL screening value existed for them. Due to the retention of the four cPAHs, the other three cPAHs were also retained as "chemicals of the same group" (CSG), and one additional organochlorine pesticide was retained since it was an isomer of the two other organochlorine pesticides selected. The soil screening results for Disposal Pit C are summarized in **Attachment B**, **Table 2**.

The results of the WMW Test for the 13 metals retained after the comparison to RSL values are summarized in **Attachment B**, **Table 3**. As is reflected in this table, the residual metal concentration statistic (i.e., Mean WMW Value) for eight of the 13 retained metals is lower than the comparable value reported for sample concentrations in the SEDA background dataset. Therefore, effects from these metals cannot be distinguished from those of background conditions. WMW Test results for the other five metals indicated that residual soil concentrations found at the Pit C excavation sites were higher than background, so these metals were retained for further processing in the risk assessment. Therefore, based on risk assessment pre-screening and background evaluations, 19 COPCs were evaluated for soil in the updated risk assessment for Disposal Pit C.

5.0 Exposure Assessment

This section describes the receptors and exposure pathways evaluated in the updated risk assessment. The objectives of the exposure assessment were to estimate the magnitude, frequency, duration, and routes of potential human exposures to COPCs at the Disposal Pit AOCs. Potential receptor groups are identified in the exposure assessment and estimates of exposure or chemical and radionuclide intake are calculated based on assumptions regarding exposure pathways and exposure parameters. The following sections of the report summarize the exposure assessment process utilized during this risk assessment.

5.1 Receptors, Exposure Pathways, and Exposure Profiles

The human health risk assessment previously conducted for the Disposal Pits site was completed based on the assumption that land within the AOC would be used for recreational or conservation purposes. Since the submittal of the RI in 2002, the SCIDA has re-designated use of the land within SEAD-12 as future institutional and training areas. In addition, a tenant has leased a portion of SEAD-12 and is currently using the property for commercial purposes (telecommunications / data warehousing). Nevertheless, the Army has updated the risk assessment previously prepared for Disposal Pits A/B and C in SEAD-12, which assumes that the land will be used for conservation/recreational purposes. Assuming that the land will continue to be used for conservation/recreational activities makes the risk assessment more conservative (i.e., more stringent because it applies restrictive exposure assumptions) than would one that assumes the property will be used for institutional/training purposes which is aligned with commercial purposes. In addition, a future 30-year resident (child, adult, and lifetime) was also included to assess potential risks and hazards to receptors under the unrestricted use scenario which is provided to address the State of New York's goal for site remediation to "restore the site to pre-disposal conditions, to the extent feasible and authorized by law". The resident scenarios assume that a child resident is present for six (age 0 to 6) of the 30-year duration and an adult is present for 24 (age 18 to 42) of the 30-year exposure period. Therefore, for this risk assessment the following receptors were evaluated:

1. Current site worker,
2. Future park worker,
3. Future recreational visitor (child),
4. Future construction worker,
5. Future adult and child resident (for hazard assessment), and
6. Future lifetime resident (for carcinogenic risk assessment).

5.1.1 Identification of Exposure Pathways

Exposures are estimated only for exposure pathways that are considered plausible and complete. A complete exposure pathway has the following four elements:

- a source and mechanism for chemical release,
- an environmental transport medium,
- an exposure point, and

- a human receptor and a feasible route of exposure at the exposure point.

A pathway cannot be completed unless each of these elements is present. **Figure 1** illustrates the completed exposure pathways for SEAD-12.

5.1.2 Sources and Receiving Media

Historic maintenance, testing, storage, and disposal operations conducted within the former WSA are the source of potential contaminants that remain at SEAD-12. Soil may be impacted directly because of these operations. Groundwater may be affected due to leaching of potential contaminants in the soil. Sediment and surface water may be affected due to run-off from the affected disposal areas.

5.1.3 Integration of Exposure Pathways

The proper framework of an exposure pathway involves a source, transport medium, exposure point, and an exposure route. The pertinent exposure pathways for SEAD-12 are summarized in **Figure 1**. According to RAGS (USEPA, 1989a), a pathway is considered incomplete if one or more of these components is not present with the exception of the transport medium, which may be absent in the case of direct exposures. Hence, the conclusion, if there is not a complete pathway, there can be no risk resulting from that theoretical pathway. For the purposes of this baseline risk assessment (BRA), current and future human exposure pathways have been identified as potential pathways, which meet the criteria for an exposure pathway.

The following pathways were not quantified based on the rationale below:

1. Ingestion and dermal contact with soil by current off-site area residents was eliminated from the risk assessment based on the unlikely occurrence of a trespasser at SEAD-12. Perimeter security fences remain in place at the WSA and the commercial tenant occupying land to the north and northwest of the former disposal pits controls access to the area via a security force.
2. The most realistic current on-site exposure scenario is considered the site worker scenario. Because the assumptions are based on present data, it was determined that modeling a future site worker would yield no different risks than the current land use scenario.

5.1.4 Summary of Exposure Pathways Quantified

The pathways presented reflect the current onsite and the projected future onsite use of the former Weapons Storage Area. This section presents the rationale for including these exposure pathways in this risk assessment.

<u>Inhalation of Particulate Matter in Ambient Air</u>

Surface soil particles may become airborne via wind erosion, which in turn may be inhaled by individuals at the site. Construction workers may also be exposed to subsurface soil particles. Therefore, inhalation exposure to soil particulates in ambient air was assessed for all current and future onsite receptors.

Incidental Ingestion of On-Site Soils

During the course of daily activities, an on-site worker, a construction worker, recreational visitor, or resident could contact site soils and involuntarily ingest and/or have their skin exposed to them. Therefore, exposure to on-site surface-soils via dermal contact and soil ingestion was assessed for all current and future onsite receptors.

Incidental Dermal Contact (Submersion) to Surface Water and Sediment

There are drainage ditches throughout SEAD-12. This surface water and the associated wet soil, or sediment, may contain chemicals found in the surface soils, since these ditches will collect runoff and soil eroded by the storm events. Because this site is located in the conservation area, park workers and recreational visitors may contact and have their skin exposed to surface water or sediment. Due to current site access restrictions, a trespasser could not contact these water bodies. Therefore, exposures to surface water and sediments via dermal contact were assessed for a future recreational visitor, a future outdoor park worker, and a future resident.

Incidental Ingestion of Sediment

When the drainage ditches are dry, there is potential for contact with the sediment contained in the ditches. While dermal contact with this sediment has been addressed above, there is also the potential that a future recreational visitor or resident might ingest some of this sediment (similar to soil ingestion). Ingestion exposure to sediment would be limited, since the sediment would often be covered by surface water or snow. Exposure to sediment by ingestion was assessed quantitatively for a future resident only.

Ingestion of Groundwater

The groundwater beneath the SEAD-12 is not currently used as a drinking water source for current site workers and there is no current on-site use of groundwater as a potable water source. Additionally, it is unlikely that a well will be installed for use by future construction workers. Therefore, ingestion of groundwater is not considered a completed pathway for each of these scenarios. For other future receptors, the plan is to obtain potable water from the existing water supply line. Potable water is supplied to the Depot from a water supply line that passes through the Town of Varick. Varick's water is obtained from the municipal water treatment plant at the Town of Waterloo. The source of this water is Lake Seneca. It is unlikely that groundwater wells would be installed for future drinking water use since a potable water pipeline exists. Furthermore, numerous investigation within the Depot indicate that the shallow groundwater aquifer at the site is inadequate with respect to both yield and quality, and provide evidence that the shallow aquifer is subject to considerable elevation variation during the year which would its use as a potential supply inconsistent. Nonetheless, since such use is not prevented via an institutional control such as a deed restriction, it is assumed that wells could be installed on site for potable water. Therefore, this is considered a complete pathway and data from the on-site wells are used to calculate exposure concentrations. Exposure via ingestion of groundwater was assessed for a future outdoor park worker, a future recreational visitor, and a future resident.

Inhalation and Dermal Contact (Submersion) with Groundwater while Showering

Recreational visitors and residents may contact groundwater while taking daily showers. These receptors may be exposed to all chemicals contained in groundwater during showering by dermal contact and volatile chemicals that partition into the air via inhalation. Therefore, this is considered a complete pathway and data from the on-site wells are used to calculate exposure concentrations. Exposure via inhalation of groundwater and dermal contact (submersion) was assessed for a future recreational visitor and a future resident.

Chemical (non-ROPC) contaminant exposure assumptions for the current site worker, future park worker, future construction worker, future recreational child visitor, adult resident, and child resident receptors are summarized in **Attachment C**, **Tables 1, 2, 3, 4, 5,** and **6**, respectively. These assumptions approximate the frequency, duration, and manner in which receptors would be exposed to environmental media.

Under USEPA guidelines, the likelihood of carcinogenic and non-carcinogenic effects due to exposure to site-related contaminants are considered separately. Non-carcinogenic risks were assessed by calculation of a Hazard Index (HI), which is an expression of the chronic daily intake of a contaminant divided by its safe or Reference Dose (RfD). A HI that exceeds 1.0 indicates the potential for non-carcinogenic effects to occur. Carcinogenic risks were evaluated using a cancer Slope Factor (SF), which is a measure of the cancer-causing potential of a chemical. Slope Factors are multiplied by daily intake estimates to generate an upper-bound estimate of excess lifetime cancer risk. For known or suspected carcinogens, USEPA has generally established 10^{-4} (i.e., one-in-ten thousand) as the upper bound of the acceptable cancer risk range that defines when action is warranted and when it may not be warranted at a site. USEPA's preferred upper bound for carcinogenic risk is 10^{-6} (i.e., one-in-one million). Between the two values, action is generally not warranted, but may be required if a chemical specific standard that defines acceptable risk is violated or unless there are non-carcinogenic effects or an adverse environmental impact that warrants action.

5.2 COPC Exposure Point Concentrations (EPCs)

Carcinogenic risk and non-carcinogenic hazard indices attributable to exposure to COPCs in soil and ambient air dust were updated and evaluated for both of the Disposal Pit areas (i.e., Pit A/B and Pit C) of concern. Risks and hazards associated with COPCs in groundwater, surface water, and sediment were not re-evaluated as part of this risk assessment update, as no new data for any of these medial were collected and characterized during the SEAD-12 Removal Action.

Risks and hazards were evaluated via reasonable maximum exposure (RME) scenario for each receptor. Soil and ambient air dust EPCs were set either equal to a contaminant's MDC or the contaminant's recommended upper confidence limit (UCL) of the arithmetic mean concentration for the available dataset. MDCs were used as EPCs where limited contaminant data existed, or when the recommended UCL EPC exceeded the maximum concentration detected at the site of interest. UCLs were used for EPCs where large-enough contaminant datasets exist to allow for the calculation of the UCL. When UCLs were used, they were calculated via the USEPA's Software for Calculating Upper

Confidence Limits (ProUCL). When necessary, datasets were analyzed in ProUCL with "ND" to account for non-detect values. This EPC calculation is consistent with USEPA guidance.

Risk due to ambient air dust exposure was evaluated based on total soil EPCs. COPCs for ambient air were determined from soil EPCs and concentrations of particulate matter that were below 10 µm in aerodynamic diameter (PM_{10}) in ambient air. Ambient PM_{10} concentrations for the construction worker were estimated using an emission and dispersion model. PM_{10} concentrations for industrial workers and residents at the Depot were set at 17 $\mu g/m^3$, which is based on particulate measurements collected at the Depot.

EPCs for soil associated with Disposal Pit A/B and C, and ambient air are presented in:

- Disposal Pit A/B: **Attachment A**, **Tables 4A** through **4B**, respectively.
- Disposal Pit C: **Attachment B**, **Tables 4A** through **4B**, respectively.

5.3 Quantification of Exposure

Each receptor's potential exposure to the identified COPCs was quantified for each of the applicable exposure pathways. Potential exposures were calculated following methods recommended in USEPA guidance documents, such as the USEPA Risk Assessment Guidance for Superfund (RAGS) (USEPA, 1989). Human health intake, or absorbed dose (depending on the exposure route), was calculated with EPCs and exposure assumptions. The total exposure of any receptor to any COPC is divided by the period of interest to obtain an average exposure. The period of interest, or averaging time, is a function of the toxic endpoint. For non-carcinogenic effects, the period of interest is the receptor's exposure time (specific to the scenario being assessed); for carcinogenic effects, it is the receptor's lifetime (assumed 70 years).

6.0 Toxicity Assessment

Toxicity variables considered in this assessment include the reference dose (RfD) and the reference concentration (RfC) to evaluate non-carcinogenic effects, and the slope factor and the unit risk to evaluate carcinogenic effects. Toxicity values for the risk assessment were selected in accordance with the USEPA-recommended (2003a) human health toxicity value hierarchy.

For the evaluation of carcinogenic cPAHs, Parsons used toxicity equivalency factors (TEFs) that are based on the toxicity of benzo(a)pyrene as published by the USEPA (1993) (see below).

PAH	TEF
Benzo(a)pyrene	1.0
Benzo(a)anthracene	0.1
Benzo(b)fluoranthene	0.1
Benzo(k)fluoranthene	0.01
Dibenzo(a,h)anthracene	1.0
Chrysene	0.001
Indeno(1,2,3-cd)pyrene	0.1

To calculate the slope factor for any given cPAH, the appropriate TEF was multiplied by the slope factor for benzo(a)pyrene.

Information regarding Gastrointestinal (GI) absorption efficiency for administered doses was used for the development of dermal toxicity factors. Specifically, oral slope factors were converted to dermal slope factors by dividing by the GI absorption efficiency; likewise, oral reference doses were converted to dermal reference doses by multiplying by the GI absorption efficiency. The derivation of dermal toxicity values for the risk assessment is consistent with USEPA (2004) recommendations. The GI absorption efficiency that was used in this risk assessment is the value recommended by the USEPA in its Supplemental Guidance for Dermal Risk Assessment. In the event that information regarding absorption of a particular substance could not be located, an oral absorption efficiency of 100% was assumed. This method is consistent with USEPA Region 2 guidance (personal communication between A. Schatz of Parsons and M. Maddeloni of USEPA Region 2).

For the development of inhalation toxicity values, RfCs were converted into inhalation RfDs with units of milligrams of chemical per kilogram of body weight per day (mg/kg-day). Similarly, inhalation unit risk factors were converted into inhalation slope factors in units of per milligrams of chemical per kilogram of body weight per day ($(mg/kg\text{-}day)^{-1}$).

Ideally, chronic RfDs and RfCs are based on chronic exposure studies of humans or animals. "Chronic exposure" for humans is considered to be exposure of seven years or more; therefore, RfDs and RfCs for chronic exposure are appropriate for evaluating adult and child residential receptor exposures. On the other hand, RfDs and RfCs for subchronic exposure, which is defined as exposure between 1 and 6 years, are appropriate for evaluating construction worker, recreational child visitor, and child resident receptor exposures. Nevertheless, as a conservative approach, chronic RfDs and RfCs were used to assess risk for all receptors.

7.0 Risk Characterization

The detailed risk calculations for soils (i.e., inhalation of dusts, ingestion, and dermal contact) associated with Disposal Pit A/B and Disposal Pit C are provided in **Attachment A**, **Tables 5** through **7** and **Attachment B**, **Tables 5** through **7** respectively. Non-cancer hazard indices and cancer risks calculated for the receptors evaluated based on their exposure to site soils are presented in **Table 2** for Disposal Pit A/B and **Table 3** for Disposal Pit C. Non-cancer hazard indices and cancer risks calculated for the receptors evaluated based on their exposure to all site media are presented in **Table 4** for Disposal Pit A/B and **Table 5** for Disposal Pit C. Non-cancer hazard indices and cancer risks calculated for the receptors evaluated based on their exposure to groundwater, surface water, and sediment are presented in **Attachment D**, **Tables 4** through **9**.

The USEPA-recommended limit for the non-carcinogenic hazard index (HI) is 1.0. The USEPA upper limit for the cancer risk level is 1×10^{-4} and the preferred limit is 1×10^{-6}.

7.1 Risk Characterization Results – Soil

7.1.1 Disposal Pit A/B

7.1.1.1 Conservation/Recreation Scenario

The following table summarizes the non-carcinogenic hazard indices (HIs) and the carcinogenic risk levels that are estimated to remain in the area of historic Disposal Pit A/B due to exposure to site soils via inhalation, ingestion, and dermal contact at the conclusion of the SEAD-12 removal action. This table also compares them to the levels previously estimated to exist due to soil exposures at the location at the conclusion of the RI.

	Removal Action Soils Risk Levels		**RI Soils Risk Levels**	
Receptor	**Hazard Index**	**Cancer Risk**	**Hazard Index**	**Cancer Risk**
Current Site Worker	2.1E-04	3.6E-08	2.6E-03	4.7E-08
Outdoor Park Worker	1.8E-03	3.2E-07	2.2E-02	4.1E-07
Recreational Child Visitor	1.3E-03	3.6E-08	1.4E-02	4.6E-08
Construction Worker	1.1E-02	4.7E-08	1.3E-01	1.5E-07

As is shown, non-carcinogenic HIs estimated to remain at the conclusion of the removal action have decreased for the current site worker, the future outdoor park worker, the future recreational child visitor, and the future construction worker receptors at Disposal Pit A/B and all are below the USEPA threshold limit of 1. Comparably, the estimated cancer risk levels estimated due to exposure to site soils for the site worker, the outdoor park worker, the recreational child visitor, and the construction worker have also all decreased from levels previously predicted at the conclusion of the RI, and are each lower than USEPA's preferred level of 1×10^{-6} for carcinogenic risk.

7.1.1.2 Residential Scenario

The following table summarizes the non-carcinogenic HIs and the carcinogenic risk levels for the adult, child, and lifetime resident that are estimated to remain in the area of historic Disposal Pit A/B due to inhalation, ingestion, and dermal contact with site soils at the conclusion of the SEAD-12 removal action, and compares them to the levels that were previously estimated to exist due to exposure to soil at the location at the conclusion of the RI.

	Removal Action Soils Risk Levels		**RI Soils Risk Levels**	
Receptor	**Hazard Index**	**Cancer Risk**	**Hazard Index**	**Cancer Risk**
Adult Resident	3.5E-03	--	4.2E-02	--
Child Resident	3.0E-02	--	3.5E-01	--
Lifetime Resident	--	1.5E-06	--	2.0E-06

The projected non-carcinogenic HIs for the adult and child resident associated with their exposure to site soils have decreased by approximately 90% from levels projected at the end of the RI, and are all below USEPA's HI target level of 1. Similarly, the lifetime resident's estimated carcinogenic risk

level associated with exposure to site soils at the conclusion of the SEAD-12 removal action has also decreased by approximately 25%, and is close to the USEPA's preferred carcinogenic risk limit (i.e., 1×10^{-6}).

7.1.2 Disposal Pit C

7.1.2.1 Conservation/Recreation Scenario

The table presented below identifies the non-carcinogenic HIs and the carcinogenic risk levels that are estimated to remain in the area of historic Disposal Pit C due to inhalation, ingestion, and dermal contact to site soils at the conclusion of the SEAD-12 removal action. This table also compares them to the levels that were estimated to exist due to soil exposures in the same area at the conclusion of the RI.

	Removal Action Soils Risk Levels		**RI Soils Risk Levels**	
Receptor	**Hazard Index**	**Cancer Risk**	**Hazard Index**	**Cancer Risk**
Current Site Worker	2.6E-04	2.2E-07	1.5E-03	2.0E-08
Outdoor Park Worker	2.3E-03	1.9E-06	1.3E-02	1.7E-07
Recreational Child Visitor	1.1E-03	8.8E-08	9.5E-03	1.9E-08
Construction Worker	1.0E-02	1.7E-08	6.5E-02	1.3E-07

As was previously observed for the Disposal Pit A/B results, the estimated levels of non-carcinogenic HIs for each receptor decreased by 80 – 90% from the prior estimated levels, and are less than USEPA's target of 1.

The estimated cancer risk levels for the site worker, the outdoor park worker, and the recreational child visitor due to exposure to soils remaining in the area of Pit C have all increased over levels previously estimated for the same receptors during the RI, while the carcinogenic risk level predicted for the construction worker has decreased. The noted increases for the site worker, park worker, and the recreational child visitor are partially attributable to the fact that inhalation of dusts containing the carcinogenic PAHs are now included in the risk calculation, whereas during the RI they were not included in the risks estimated due to the lack of an inhalation reference dose. Additionally, the EPCs for indeno(1,2,3-cd)pyrene computed for the souls remaining at Disposal Pit C after the removal action, and which is derived from a limited dataset (i.e., four detections in 71 samples during the RA compared to 16 detections in 46 samples observed during the RI), is roughly five times higher than was detected during the RI, which results in elevated soil dermal and soil ingestion risk levels. However, despite these differences, the carcinogenic risk attributable to soul alone at Disposal Pit C are less than or approximately equivalent to the USEPA's preferred carcinogenic risk threshold of 1×10^{-6}.

7.1.2.2 Residential Scenario

The following table identifies the non-carcinogenic hazard indices and the carcinogenic risk levels for the adult, child, and lifetime resident that are estimated to remain at Disposal Pit C due to inhalation, ingestion, and dermal contact exposure with site soils at the conclusion of the SEAD-12 removal action, and compares them to the levels that were previously estimated to exist due to exposure to soil at the location at the conclusion of the RI.

	Removal Action Soils Risk Levels		**RI Soils Risk Levels**	
Receptor	**Hazard Index**	**Cancer Risk**	**Hazard Index**	**Cancer Risk**
Adult Resident	4.6E-03	--	2.5E-02	--
Child Resident	2.8E-02	--	2.4E-01	--
Lifetime Resident	--	6.3E-06	--	8.4E-07

The provided data again indicate that HIs estimated due to exposure to site soils for the adult and child residents have decreased by 80% to 90% and are both below the USEPA's accepted level of 1. The estimated cancer risk for the lifetime resident due to exposure to site soils has increased over prior RI estimated levels, but is still less than the USEPA's upper carcinogenic risk limit (i.e., 1×10^{-4}), but above the USEPA's preferred lower limit of 1×10^{-6}.

The increased cancer risk levels that are now estimated for the lifetime resident, current site worker, the future outdoor park worker, and the future child residential visitor to the Disposal Pit C area are primarily associated with each receptor's ingestion and inhalation of soil that contains alpha-BHC. Alpha-BHC was found in four soil samples (three sidewall and one perimeter sample) at the conclusion of the removal action, and each of these samples was collected from Disposal Pit C2 near the northern end of the excavation. Excavations performed in this portion of Pit C2 extended to depths greater than 10 or 11 feet below grade, with surrounding slope stabilization benches set at levels that were between 3 and 6 feet below grade. Normally analytical results for soils collected at these depths are excluded from datasets that are assembled for resident and non-construction worker receptor scenario evaluations, as typically these types of receptors do not have repetitive, long-term exposures to buried soils. If the risk associated with the ingestion and inhalation of alpha-BHC was eliminated from each of these risk calculations, the lifetime resident's carcinogenic risk due to soil exposure would drop to 1.0×10^{-6}, which is at the USEPA's preferred lower carcinogenic risk limit. Comparably, the carcinogenic risk levels for each of the other receptors would decrease to levels within or below the USEPA's risk management range (i.e., 1×10^{-4} to 1×10^{-6}).

The excavation at Pit C2 was not backfilled with borrow material at the conclusion of the removal action; instead the area was filled using available surrounding soils. Therefore as a conservative measure, soil risks for each receptor were assessed versus the total soil dataset that was assembled at the outset of the risk assessment update. Furthermore, the maximum detected concentration (210 µg/kg) was used as the EPC evaluated for alpha-BHC in the risk assessment, and using the maximum concentration also adds to the conservatism of the updated risk assessment.

7.2 Risk Characterization Results – Other Media

Non-carcinogenic hazard and carcinogenic risk levels predicted to results due to these media due to inhalation of groundwater, ingestion of groundwater, dermal contact with groundwater, dermal contact with surface water, ingestion of sediment, and dermal contact with sediment are identified in **Attachment D**, **Tables 4** through **9**, respectively.

7.3 Overall Site Risks due to Chemical Contaminants

7.3.1 Disposal Pit A/B

7.3.1.1 Conservation/Recreational Receptors

The table presented below summarizes the calculated reasonable maximum exposure carcinogenic risks and the non-carcinogenic hazard indices for conservation/recreational receptor due to all chemical exposure scenarios considered in this risk assessment for Disposal Pits A/B. Comparative risk assessment results are also presented from the 2002 RI risk assessment for chemical contaminants.

	Removal Action Risk Levels		**RI Risk Levels**	
Receptor	**Hazard Index**	**Cancer Risk**	**Hazard Index**	**Cancer Risk**
Current Site Worker	2.1E-04	3.6E-08	3.E-03	5E-08
Outdoor Park Worker	1.2E-01	2.0E-05	9E-02	2E-05
Recreational Child Visitor	3.1E-01	2.0E-05	3E-01	2E-05
Construction Worker	1.1E-02	4.7E-08	1E-01	1E-07

Current Site Worker

Three chemical exposure routes were evaluated for the site worker. The total cancer risk from all chemical exposure routes is below the USEPA target range for the RME. Likewise, the total non-cancer hazard index from all exposure routes is less than one for the RME. Carcinogenic risk and non-carcinogenic hazard levels reported at the end of the RA are lower than those reported at the conclusion of the RI.

Future Outdoor Park Worker

Six chemical exposure routes were evaluated for the outdoor park worker. The total cancer risk from all chemical exposure routes is within the USEPA target range for the RME. The total non-cancer hazard index from all exposure routes is less than one for the RME. The non-carcinogenic hazard level is slightly higher than was calculated at the time of the RI risk assessment, with noted increases due to the dermal contact with surface water and the ingestion of groundwater. The ingestion of cobalt in groundwater is the major contributor to the non-carcinogenic hazard increase noted between the RI and the RA and results from the fact that this effect was not quantified in the earlier risk calculation.

Future Recreational Visitor (Child)

Eight chemical exposure routes were evaluated for the child recreational visitor. The total cancer risk from all chemical exposure routes is within the USEPA target range for the RME. The total non-cancer hazard index from all exposure routes is less than one for the RME. Calculated non-carcinogenic hazard and carcinogenic risk levels are generally consistent with those reported at the end of the RI.

Future Construction Worker

Three chemical exposure routes were evaluated for the construction worker. The total cancer risk from all chemical exposure routes is below the USEPA target range for the RME. Likewise, the total non-cancer hazard index from all exposure routes is less than one for the RME. Carcinogenic risk and non-carcinogenic hazard levels reported at the end of the RA are lower than those reported at the conclusion of the RI.

7.3.1.2 Residential Receptors

	Removal Action Risk Levels		RI Risk Levels	
Receptor	**Hazard Index**	**Cancer Risk**	**Hazard Index**	**Cancer Risk**
Adult Resident	9.6E-01	--	7E-01	--
Child Resident	2.8E+00	--	2E+00	--
Lifetime Resident	--	7.0E-04	--	7E-04

Future Resident

Nine chemical exposure routes were evaluated for the future resident. For the RME, the total cancer risk from all chemical exposure routes, 7.0×10^{-4}, exceeds the USEPA target range. The total non-cancer hazard index from all chemical exposure routes for the adult resident is below, while the child resident's hazard index exceeds (HI = 2.8), USEPA's preferred limit of 1. Reported carcinogenic risk levels reported for the lifetime resident are consistent with those reported at the completion of the RI, while the non-carcinogenic hazard indices for both the adult and the child resident have increased since the completion of the risk assessment in the RI.

Dermal Contact with groundwater and surface water are the exposure routes responsible for the calculated RME cancer risk. The chemical that drives both of the noted carcinogenic risk levels is benzo(a)pyrene: cancer risk for dermal contact to groundwater equals 3.3×10^{-4}; cancer risk for dermal contact to surface water equals 2.2×10^{-4}.

The adult and child resident's elevated HI are primarily driven by dermal contact with surface water, with other significant impacts from ingestion of groundwater, and lesser contributions from dermal contact and inhalation of with groundwater. The non-carcinogenic hazard quotient due to the presence of chrysene in surface water is the contaminant most responsible for the noted HI increases; chrysene impact was not quantified in the RI because no dermal RfD was identified. The noted hazard indices increase for the adult and child resident is due to ingestion of cobalt in the

groundwater, which was not quantified in the RI risk assessment. The noted increase in the HI levels due to dermal contact with groundwater is also attributable to cobalt.

7.3.2 Disposal Pit C (C1 and C2)

7.3.2.1 Conservation/Recreational Receptors

The next table summarizes the calculated reasonable maximum exposure carcinogenic risks and the non-carcinogenic hazard indices for conservation/recreational receptor due to all chemical exposure scenarios considered in this risk assessment for Disposal Pits A/B. Comparative risk assessment results are also presented from the 2002 RI risk assessment for chemical contaminants.

	Removal Action Risk Levels		**RI Risk Levels**	
Receptor	**Hazard Index**	**Cancer Risk**	**Hazard Index**	**Cancer Risk**
Current Site Worker	2.6E-04	2.2E-07	1.E-03	2E-08
Outdoor Park Worker	1.2E-01	2.2E-05	8E-02	2E-05
Recreational Child Visitor	3.1E-01	2.0E-05	2E-01	2E-05
Construction Worker	1.0E-02	1.7E-07	6E-02	1E-07

Current Site Worker

Three chemical exposure routes were evaluated for the current site worker at Pit C. The total cancer risk from all chemical exposure routes is below the USEPA's target range of $1 \times 10^{-4} - 1 \times 10^{-6}$, based on a RME. Likewise, the total non-cancer hazard index from all exposure routes is less than 1. The carcinogenic risk level reported at the end of the RA is higher than comparable values reported at the conclusion of the RI. The primary driver contributing to the increase in the carcinogenic risk dermal contact with soil that contains alpha- and beta-BHC; potential carcinogenic risk due to contact with these pesticides were not quantified during the RI risk evaluation. The post-RA non-carcinogenic hazard index for the current site worker is lower than the one determined during the RI risk assessment.

Future Outdoor Park Worker

Six chemical exposure routes were evaluated for the outdoor park worker at Pit C. The total cancer risk from all chemical exposure routes is within the USEPA's target range for the RME. The total non-cancer hazard index from all exposure routes is less than 1 for the RME. The post-RA non-carcinogenic hazard level is slightly higher than was calculated at the time of the RI, with noted increases due to the dermal contact with surface water and the ingestion of groundwater. The ingestion of cobalt in groundwater is the major contributor to the non-carcinogenic hazard increase noted between the RI and the RA and results from the fact that this effect was not quantified in the earlier risk calculation. Dermal contact with chrysene in surface water is the major contributor to this noted shift between the post-RA and post-RI results, as this effect was not quantified during the earlier risk evaluation.

Future Recreational Visitor (Child)

Eight chemical exposure routes were evaluated for the child recreational visitor at Pit C. The total cancer risk from all chemical exposure routes is within the USEPA's target range for the RME. The total non-cancer hazard index from all exposure routes is less than one for the RME. Calculated non-carcinogenic hazard and carcinogenic risk levels are generally consistent with those reported at the end of the RI, with the small increase noted in the HI level being attributable to dermal contact with chrysene in surface water that was not quantified during the RI.

Future Construction Worker

Three chemical exposure routes were evaluated for the future construction worker at Pit C. The total cancer risk from all chemical exposure routes is below the USEPA's target range for the RME. Likewise, the total non-cancer hazard index from all exposure routes is less than one for the RME. Carcinogenic risk and non-carcinogenic hazard levels reported at the end of the RA are lower than those reported at the conclusion of the RI.

7.3.2.2 Residential Receptors

	Removal Action Risk Levels		RI Risk Levels	
Receptor	**Hazard Index**	**Cancer Risk**	**Hazard Index**	**Cancer Risk**
Adult Resident	9.6E-01	--	7E-01	--
Child Resident	2.8E+00	--	2E+00	--
Lifetime Resident	--	7.0E-04	--	7E-04

Future Resident

Nine chemical exposure routes were evaluated for the future resident. For the RME, the total cancer risk from all chemical exposure routes, 7.0×10^{-4}, exceeds the USEPA target range. The total non-cancer hazard index from all chemical exposure routes for the adult resident is below, while the child resident's hazard index exceeds (HI = 2.8), USEPA's preferred limit of 1. Reported carcinogenic risk levels reported for the lifetime resident are consistent with those reported at the completion of the RI, while the non-carcinogenic hazard indices for both the adult and the child resident have increased since the completion of the risk assessment in the RI.

Dermal Contact with groundwater and surface water are the exposure routes responsible for the calculated RME cancer risk. The chemical that drives both of the noted carcinogenic risk levels is benzo(a)pyrene: cancer risk for dermal contact to groundwater $= 3.3 \times 10^{-4}$; cancer risk for dermal contact to surface water 2.2×10^{-4}.

The adult and child resident's elevated HIs are primarily driven by dermal contact with surface water, with other impacts from ingestion of groundwater, and lesser contributions from dermal contact and inhalation of with groundwater. The quantitation of a non-carcinogenic hazard quotient due to the presence of chrysene in surface water is the contaminant most responsible for the noted HI increases; chrysene impact was not quantified in the RI because no dermal RfD was identified. The noted

hazard indices increase for the adult and child resident is due to ingestion of cobalt in the groundwater, which was not quantified in the RI risk assessment. The noted increase in the HI levels due to dermal contact with groundwater is also attributable to cobalt.

The reader is cautioned that the cancer risk values attributed to benzo(a)pyrene due to dermal contact with water are highly uncertain and may grossly overestimate actual risks. In groundwater this compound was detected in only two wells during the same sampling event and was not confirmed during the second round of groundwater sampling (i.e. results were non detect for this compound). In both cases, the reported concentration was a very low estimated value, lower than the quantitation limit for the samples. In surface water this compound was detected in one sample during the ESI study phase; the compound was not detected during the RI study phase. Therefore, it is highly unlikely that the compound is pervasive in either groundwater or surface water across SEAD-12, and it is possible that the detections were analytical artifacts associated with the laboratory's effort to identify and semi-quantify compounds at very low concentrations. Also, in "Dermal Exposure Assessment: Principals and Applications", USEPA warns that its exposure assessment method for dermal contact with water during showering may yield seemingly unreasonable (i.e., counterintuitive) results. For instance, the absorbed dose due to dermal contact may exceed the dose received by direct ingestion of the same water. This was the case for benzo(a)pyrene in groundwater at SEAD-12.

7.4 Risk Characterization Results for Lead Exposures

Determination of receptor exposure to lead was not performed as part of this risk assessment since lead was not identified as a contaminant of concern in any of the datasets analyzed during this assessment.

8.0 Uncertainty Assessment

All risk assessments involve the use of assumptions, judgments, and imperfect data to varying degrees. This results in uncertainty in the final estimates of risk. There are uncertainties associated with each component of the risk assessment from data collection through risk characterization. For example, there is uncertainty in the initial selection of substances used to characterize exposures and risk on the basis of the sampling data and available toxicity information. Other sources of uncertainty are inherent in the toxicity values for each substance and the exposure assessments used to characterize risk. Finally, additional uncertainties are incorporated into the risk assessment when exposures to several substances across multiple pathways are summed. Areas of uncertainty in each risk assessment step are discussed below.

8.1 Uncertainty in Data Collection and Evaluation

Uncertainties in the data collection/evaluation step of the risk assessment focus on determining whether enough samples were collected to characterize the risk, and if sample analyses were conducted in a qualified manner to maximize the confidence in the results. Results of the sample analyses were used to develop a database that includes a complete list of the chemicals by media and their representative concentrations used in the risk assessment. The sampling and analysis for this risk assessment included soil, surface water, sediment, and groundwater components of the

comprehensive RI effort that was undertaken at the site in the 1998 to 2002 timeframe, and focused confirmational soil sampling that took place as part of the RA. Therefore, the samples collected and characterized were not collected randomly but were collected either from areas of the site known or suspected to be to be contaminated (RI samples) or from areas the sampling and analysis effort focused on the attainment of an acceptable cleanup level. This type of non-random sampling biases the data collected, in the case of the RI toward overestimating chemical concentrations from the site, as opposed to the RA sampling where lesser levels of contamination are sought.

The judgmental bias in the sample collection also limits the applicability of statistics to the database. Because the statistics used to calculate the upper limit of the 95th-percentile confidence interval assume that the data represents a randomly distributed population, and the database does not, there is inherent uncertainty in the application of statistics. Collection of non-random, judgmental samples was necessary to characterize the nature and extent of contamination that is an objective of the site investigations and actions.

All chemicals detected that were potentially site-related were retained in this assessment. Chemicals that were never detected were eliminated from the assessment. This practice may slightly underestimate risks due to low levels (i.e., below the sample quantitation limit) of eliminated chemicals. Since the RI samples were collected at areas where concentrations were expected to be high, it is very unlikely that any chemicals were present at the site at health-significant levels and not detected in at least one sample. However, if this did occur, this assumption will underestimate risk. The 95th UCLs were used to calculate site-related risks. Since that assumption implies chronic exposure to the 95th UCL concentration, this assumption is likely to overestimate risk.

For surface water, sediment, and groundwater data collected during the RI, if a chemical was detected, it was retained in the risk assessment regardless of how frequently it was detected. To calculate the upper limit of the 95th-percentile confidence interval, chemicals were assumed present in all samples in a media. When the chemical was not detected in a sample, one-half of the SQL was used. Especially for chemicals that were detected in only a few samples, the upper limit of the 95th-percentile confidence interval probably greatly overestimates the amount of the chemical present and, consequently, the risk from the chemical.

Comparatively, all soil data collected during the RI and RA and used to comprise the dataset for the risk evaluation, if a chemical was detected, it was retained in the risk assessment regardless of how frequently it was detected. The EPC for this media was based on the USEPA's ProUCL software package, from which either the highest of the recommended UCL values was used as the EPC, or in the event that the recommended UCL value exceeded the maximum detected at the site, the maximum was substituted in its place. This computational and selection process probably leads to the overestimation of the chemical present and, consequently, the risk predicted from the chemical in soil.

The database also includes a number of data validation flags, indicating uncertainty in the reliability of the performance of the analyses done by the laboratory. Flagged data were retained following RAGS guidance.

8.2 Uncertainty in Exposure Assessment

There are inherent uncertainties in predicting future land uses and future chemical concentrations. Future land use scenarios were based on current plans for redevelopment of this portion of SEDA. Current land uses were identified by characterizing the site's physical setting.

A large part of the risk assessment is the estimation of risks for a broad set of exposure scenarios and pathways. If exposure does not occur, no risks are present. This assessment does not factor in the probability of the exposure occurring. For certain pathways, exposure may be extremely unlikely. For example, the future park worker, the future recreational visitor and the future resident all are assumed to ingest groundwater under exposure pathways assessed even though it is unlikely that such future use will ever be needed or realized due to the presence of an alternative, non-groundwater derived source of potable water at the site.

Once pathways are identified, exposure point concentrations must be estimated. There is always some doubt as to how well an exposure model approximates the actual conditions receptors will be exposed to at a given site. Key assumptions in estimating exposure point concentrations and exposure assumptions and their potential impact on the assessment are described in the following paragraphs.

As summarized in **Attachment C**, **Tables 1** though **6**, there are many factors that determine the level of exposure for each exposure pathway. These factors include inhalation rates, ingestion rates, exposure frequencies, exposure durations, body weight, etc. The values for these exposure factors must be selected by the risk assessor to represent each receptor. For the RME scenarios particularly, upper bound values were selected for each exposure factor. In the calculations of RME exposure, these multiple upper-bound exposure factor estimates compound to yield intakes and absorbed doses that overestimate likely exposure levels.

There is further uncertainty in the quantitative dermal exposure assessments for soil and sediment, since these assessments have been limited to just five compounds with credible dermal absorption factors. Many other compounds were measured in soil and sediment that might be absorbed through the skin, although reliable quantitative absorption factors are not available. Ignoring this larger group of chemicals results in quantitative exposure estimates (absorbed doses), which underestimate the true potential exposures from dermal contact. Consequently, any risk associated with these compounds is also underestimated.

There is considerable uncertainty in the quantitative dermal exposure assessments for surface water (during swimming or wading) and groundwater (during showering). EPA has cautioned that its recommended approach for calculating dermal exposures to organic chemicals in water may be overly conservative. USEPA expressed concern that for some compounds its model estimates absorbed dose from dermal exposure during showering that are much greater than the dose from ingestion of 2 L/day of water. USEPA further states that model validation is difficult due to a lack of data. This effect is most notable for compound with high estimated Kp values (Kp > 0.1 cm/hr), such as PCBs and PAHs. Consequently, risks associated with these compounds may be overestimated.

There is also uncertainty associated with using oral toxicity values to calculate dermal risks. As seen in the literature, there are differences between oral and inhalation absorption efficiencies. These differences vary and will likely cause either underestimation or overestimation of dermal risks. The efficiencies are generally within 1 order of magnitude of each other, so the uncertainty introduced is less than 1 order of magnitude.

The EPCs derived from the measured chemical concentrations are assumed to persist without change for the entire duration of each exposure scenario. It is likely that some degradation would occur over time, particularly for some of the organic compounds that would reduce the current concentrations. Therefore, this steady state assumption tends to overestimate exposure levels.

8.3 Uncertainty in Toxicity Assessment

Of the chemicals of potential concern, a number had no reference dose or slope factors. Several of these compounds have toxicity information such as weight of evidence classification indicating a strong potential for adverse health effects, particularly lead. The absence of toxicity values of these chemicals tends to underestimate risks.

There is considerable uncertainty inherent in the toxicity values for both carcinogens and noncarcinogens. Many of the studies are based on animals and extrapolated to humans, and in some cases, subchronic studies must be used to assess chronic effects. Most cancer slope factors are calculated using a model that extrapolates low dose effects from high dose animal studies. Because toxicity constants are generally based on the upper limit of the 95th-percentile confidence interval or incorporate safety factors to compensate for uncertainty, chemical-specific risks may be overestimated.

Toxicity information was not available for dermal exposure; hence, several assumptions had to be made which may tend to over- or underestimate risk. Oral toxicity values were used without adjustment to calculate risks from dermal exposure because the EPA has not derived toxicity values for this route of exposure. However, values found in the literature (Owen, 1990) indicate that the uncertainty associated with using oral absorption to estimate dermal absorption is likely less than one order of magnitude. This is due to the lack of scientific studies available to quantify dermal toxicity and carcinogenic potential for the vast majority of priority pollutants and because chemical specific information needed to convert ingested dose to absorbed dose is not available.

8.4 Uncertainty in Risk Characterization

Uncertainties in the toxicity assessment are compounded under the assumption of dose additivity for multiple substance exposure. That assumption ignores possible synergisms and antagonisms among chemicals, and assumes similarity in mechanisms of action and metabolism. Synergism is the amplification of one chemical's toxic effect by the presence of a second chemical. For example, it is known that smokers also exposed to asbestos have higher lung cancer incidence than either smokers or asbestos workers alone. Ignoring synergism to the extent that it may occur at environmental levels tends to underestimate risk. Antagonism is the reduction of one chemical's toxic effect by the presence of a second chemical. For example, certain foods (such as broccoli) contain chemicals

believed to be anti-carcinogenic. Ignoring antagonism tends to overestimate risk. Risks summed for chemicals having various weight-of-evidence classifications as well as different target organs may also tend to overestimate risk.

8.5 Uncertainty Pertaining to Dermal Risks from PAHs in Water

There is considerable uncertainty associated specifically with dermal exposures PAHs in groundwater and surface water at SEAD-12. Areas of uncertainty are discussed below:

1. Low frequency of detection. Benzo(a)pyrene was detected in just two of 89 groundwater samples and one of 52 surface water samples. The statistical treatment of these datasets to develop EPCs is highly uncertain, since it is dominated by "non-detect" values and the underlying distributions cannot be determined. Potential exposures to compounds detected so sporadically cannot be characterized with confidence.

2. Compound detected in one of two sampling rounds. Benzo(a)pyrene in groundwater was detected in just one of two sampling rounds from the same two set of wells. Therefore, its presence is unconfirmed in the second set of tests. Benzo(a)pyrene in surface water was detected in the first study phase, the ESI, but not in the second study, the RI.

3. Concentrations reported below the Sample Quantitation Limit (SQL). The detected results for benzo(a)pyrene in both groundwater and surface water were estimated values below the SQL. Identification and quantitation near the analytical detection is highly uncertain, and these results may be artifacts of the analytical process.

4. Dermal exposure modeling is highly uncertain. EPA believes that its recommended model for estimating absorbed doses of organic compounds from dermal contact with water may overestimate true potential doses, with factors used here being even more conservative than recent guidance. This would tend to further discount the risk associated with dermal exposure to benzo(a)pyrene (future risk assessment calculations will utilize the lower adherence factor values). Absorbed doses from dermal exposure that greatly exceed the ingestion dose from the same water are counterintuitive and do not appear to be realistic. The model has not been adequately validated.

9.0 Conclusion

The update of the risk assessment based on the analysis and inclusion of confirmatory soil samples collected during the removal action along with other historic site soil samples that remain in proximity to the former burial sites indicates that there is no unacceptable levels of carcinogenic risk or non-carcinogenic hazards associated with the levels of chemicals that are now documented to remain in the soil at the locations of former Disposal Pits A/B and C. Therefore, the levels of risk that remain at the site of the excavations are equivalent to those previously identified during the Remedial Investigation of SEAD-12, which were previously accepted by the agencies based on the risk management and uncertainty discussion presented in the SEAD-12 Remedial Investigation Report.

Notes:
(1) Material within depth range that have been free of debris and therefore recovered for potential use as backfill.
(2) Overburden/C1 soil sampled and analyzed, and reused as backfill for Pit A/B based on new data.
Old data for RI samples eliminated from soil data set.

Notes:

1. Field duplicate pairs were averaged as a discrete sample. Laboratory duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
2. The maximum detected concentration was used for screening.
3. Metals are compared to Background Dataset using Pro UCL Wilcoxon Mann Whitney Tests.
4. EPA Regional Screening Levels for residential soil. On-line resources available at http://www.epa.gov/region09/superfund/prg/index.html. Last updated June 2011.
   USEPA RSLs were derived based on Direct contact exposure (ingestion and dermal contact) and a target Cancer Risk of 1E-6 or a Target Hazard Quotient of 0.1.
   Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 200 mg/day soil ingestion and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium) from Marilyn Wright (2001) Dietary Reference Intakes.
   RSL for chromium (III, insoluble salt) was used as screening value for chromium.
   PRG for nickel (soluble salts) was used as screening value for nickel.
5. Potential ARAR/TBC values are from NYSDEC Brownfield Unrestricted Use Soil Cleanup Objectives, http://www.dec.state.ny.us/website/regs/subpart375_6.html
6. Rationale codes
   Selection Reason: Above Screening Levels (ASL)
   Chemicals in the Same Group were retained as COPC (CSG)
   Deletion Reason: Essential Nutrient (NUT)
   Below Screening Level (BSL)
   No Screening Value (NSV)

Definitions:
COPC = Chemical of Potential Concern
ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
Q = Qualifier
J = Estimated Value

Thallium [1]	39	68.1	54	31.76	FALSE	**TRUE**	FALSE		**Yes**

Notes:
1. Detected result for metal account for 10% (or less) of the Pit A/B dataset.
2. Below is a description of the True/False values for the particular scenario being evaluated.

Mean/Median of Site = Mean/Median of Background
True = Do Not Reject H0, Conclude Site = Background, P-Value >= alpha (0.05)
False = Reject H0, Conclude Site <> Background, P-Value < alpha (0.05)

Mean/Median of Site >= Mean/Median of Background
True = Do Not Reject H0, Conclude Site >= Background, P-Value >= alpha (0.05)
False = Reject H0, Conclude Site < Background, P-Value < alpha (0.05)

Mean/Median of Site <= Mean/Median of Background
True = Do Not Reject H0, Conclude Site <= Background, P-Value >= alpha (0.05)
False = Reject H0, Conclude Site > Background, P-Value < alpha (0.05)

Notes:

1. All values were calculated by ProUCL version 4.00.04 using the combined RI and RA dataste for Pit A, Pit B, and Pit C1 overburden material.
2. Grey shaded cells represent non-detects in the dataset influencing which statistical methods were available (10 or more detects recommended). If the Student-t method was not available the Maximum Likelihood Estimate(MLE) Method for Normal distribution was used. If the MLE Method could not be calculated the DL/2 Substitution Method was used in its place.
3. The EPCs were calculated using the ProUCL (Version 4.00.04) and the EPCs were selected in accordance with the ProUCL Version 4.0 User Guide (USEPA, 2009) and the Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites (USEPA, 2002).
4. **Bold** values have limited detection frequency (4 or less observations).

Other Notes Q = Dayta Validation Qualifier
J = Estimated Value

Notes:

1. Field duplicate pairs were averaged as a discrete sample. Laboratory duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
2. The maximum detected concentration was used for screening.
3. Metals are compared to Background Dataset using Pro UCL Wilcoxon Mann Whitney Tests.
4. EPA Regional Screening Levels for residential soil. On-line resources available at http://www.epa.gov/region09/superfund/prg/index.html. Last updated June 2011.
   USEPA RSLs were derived based on Direct contact exposure (ingestion and dermal contact) and a target Cancer Risk of 1E-6 or a Target Hazard Quotient of 0.1.
   Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 200 mg/day soil ingestion and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium) from Marilyn Wright (2001) Dietary Reference Intakes.
   RSL for xylene, meta diet was used as screening value for xylene, meta/para.
   RSL for cadmium, diet was used as screening value for cadmium.
   RSL for chromium (III, insoluble salt) was used as screening value for chromium.
   PRG for nickel (soluble salts) was used as screening value for nickel.
5. Potential ARAR/TBC values are from NYSDEC Brownfield Unrestricted Use Soil Cleanup Objectives, http://www.dec.state.ny.us/website/regs/subpart375_6.html
6. Rationale codes
   Selection Reason:
   - Above Screening Levels (ASL)
   - Chemicals in the Same Group were retained as COPC (CSG)

   Deletion Reason:
   - Essential Nutrient (NUT)
   - Below Screening Level (BSL)
   - No Screening Value (NSV)

Definitions:

COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

Q = Qualifier

J = Estimated Value

J = Estimated Value

Zinc	72	52.05	54	78.77	FALSE	FALSE	**TRUE**	No

Notes:
1. Thallium detected result account for 3% of the Pit C dataset.
2. Below is a description of the True/False values for the particular scenario being evaluated.

Mean/Median of Site = Mean/Median of Background
True = Do Not Reject H0, Conclude Site = Background, P-Value >= alpha (0.05)
False = Reject H0, Conclude Site <> Background, P-Value < alpha (0.05)

Mean/Median of Site >= Mean/Median of Background
True = Do Not Reject H0, Conclude Site >= Background, P-Value >= alpha (0.05)
False = Reject H0, Conclude Site < Background, P-Value < alpha (0.05)

Mean/Median of Site <= Mean/Median of Background
True = Do Not Reject H0, Conclude Site <= Background, P-Value >= alpha (0.05)
False = Reject H0, Conclude Site > Background, P-Value < alpha (0.05)

Thallium	mg/kg	1.22	0.39	1.70	J	mg/kg	**1.13**	95% KM (% Bootstrap) UCL	Non-Parametric

Notes:
1. All values were calculated by ProUCL version 4.00.04 using the combined RI and RA dataset for Pits C1 and C2.
2. Grey shaded cells represent non-detects in the dataset influencing which statistical methods were available (10 or more detects recommended). If the Student-t method was not available the Maximum Likelihood Estimate(MLE) Method for Normal distribution was used. If the MLE Method could not be calculated the DL/2 Substitution Method was used in its place.
3. The EPCs were calculated using the ProUCL (Version 4.01.00) and the EPCs were selected in accordance with the ProUCL Version 4.01 User Guide (USEPA, 2009) and the Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites
4. **Bold** values have limited detection frequency (4 or less observations).

Other Notes Q - qualifier

CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO SOIL
REASONABLE MAXIMUM EXPOSURE (RME)
SEAD-12 Updated Risk Assessment
Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = $\frac{CS \times CF \times SA \times AF \times ABS \times EF \times ED}{BW \times AT}$

Variables (Assumptions for Each Receptor are Listed at the Bottom):

CS = Chemical Concentration in Soil, from Soil EPC Data
CF = Conversion Factor
SA = Surface Area Contact
AF = Adherence Factor
ABS = Absorption Factor
EF = Exposure Frequency
ED = Exposure Duration
BW = Bodyweight
AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Equation for Total Lifetime Cancer Risk = Adult Contribution + Child Contribution

ATTACHMENT D TABLE 4 (Groundwater)
CALCULATION OF INTAKE AND RISK FROM INHALATION OF GROUNDWATER (WHILE SHOWERING)
REASONABLE MAXIMUM EXPOSURE (RME) - SEAD-12
SEAD-12 Remedial Investigation
Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = $\frac{CA \times IR \times EF \times ED}{BW \times AT}$

Variables (Assumptions for Each Receptor are Listed at the Bottom):
CA = Chemical Concentration in Air
IR = Inhalation Rate
EF = Exposure Frequency
ED = Exposure Duration
BW = Bodyweight
AT = Averaging Time

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Analyte	Inhalation RfD	Carc. Slope Inhalation	EPC* Air	Current Site Worker				Future Outdoor Park Worker				Future Recreational Visitor (Child)				Future Construction Worker

ATTACHMENT D TABLE 7 (Surface Water)
CALCULATION OF ABSORBED DOSE AND RISK FROM DERMAL CONTACT TO SURFACE WATER
REASONABLE MAXIMUM EXPOSURE (RME)
SEAD-12 Remedial Investigation
Seneca Army Depot Activity

Equation for Intake (mg/kg-day) = $\frac{DA \times SA \times EF \times ED}{BW \times AT}$

Variables (Assumptions for Each Receptor are Listed at the Bottom):

DA = Absorbed Dose per Event
SA = Surface Area Contact
EF = Exposure Frequency
ED = Exposure Duration
BW = Bodyweight
AT = Averaging Time

Equation for Absorbed Dose per Event (DA):

For organics with ET < t*:

For organics with ET > t* DA = Kp x CW x [ET/(1+B) + 2Tau(1+3B)/(1+B)] x CF

For inorganics: DA = Kp x CW x ET x CF

Kp = Permeability Coefficient
CW = EPC Surface Water
ET = Exposure Time
Tau = Lag Time
CF = Conversion Factor
B = Bunge Model Value

Equation for Hazard Quotient = Chronic Daily Intake (Nc)/Reference Dose

Equation for Cancer Risk = Chronic Daily Intake (Car) x Slope Factor

Assumptions for Future Resident (Adult)

CF =	1E-06	kg/mg
SA =	5,700	cm2
AF =	0.07	mg/cm2
EF =	45	days/year
ED =	24	years
BW =	70	kg
AT (Nc) =	8,760	days
AT (Car) =	25,550	days

Assumptions for Future Resident (Child)

CF =	1E-06	kg/mg
SA =	2,800	cm2
AF =	2.7	mg/cm2
EF =	45	days/year
ED =	6	years
BW =	15	kg
AT (Nc) =	2,190	days
AT (Car) =	25,550	days

Note: Cells in this table were intentionally left blank due to a lack of toxicity data.
NA= Information not available.
* USEPA Region 2 recommends quantifying dermal exposure only for cadmium, arsenic, PCBs, dioxins/furans and pentachlorophenol, since absorption factors are not available for other chemicals of concern.

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^oC)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

DataRam 4 Dust Monitor, Serial Number D464

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)
1	92.8	22.6	50	0.2062	7:14:47	29-Jul-09	
2	114.5	22.4	55	0.2514	7:15:47	29-Jul-09	
3	115.9	22.5	60	0.2574	7:16:47	29-Jul-09

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^oC)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

DataRam 4 Dust Monitor, Serial Number D464

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^oC)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

DataRam 4 Dust Monitor, Serial Number D464

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

DataRam 4 Dust Monitor, Serial Number D464

Appendix I
Ambient Air Dust Monitoring Results - SEAD-12 Removal Action

Seneca Army Depot Activity
Romulus, NY

DataRam 4 Dust Monitor, Serial Number D454

Record Number	Mass Reading (ug/m^3)	Ambient Temperature (^{o}C)	Relative Humidiity (%)	Diameter	Time 24 hour Clock	Date	15 Minute Rolling Average (ug/m^3)

DataRam 4 Dust Monitor, Serial Number D464

APPENDIX L

RESPONSE TO COMMENTS

(This page has been intentionally left blank)

Army's Response to Comments from the United States Environmental Protection Agency

Subject: Draft Construction Completion Report
Radiological Waste Burial Pits (SEAD-12)
Seneca Army Depot
Romulus, New York

Comments Dated: May 20, 2010

Date of Comment Response: July 19, 2010

Army's Response to Comments

GENERAL COMMENTS

Comment 1: The Report indicates that monitoring wells were excavated and removed in their entirety. However, it appears that the New York State Department of Environmental Conservation (NYSDEC)'s "Groundwater Monitoring Well Decommissioning Policy" (dated November 3, 2009) was not followed. The *Draft Final Completion Report, Former Sludge Waste Piles (SEAD-5), Seneca Army Depot Activity*, Romulus, New York, dated April 2010, indicates that the bottom of the wells to be abandoned will be punched out, and the interior annulus will be grouted with a Portland cement/bentonite/water slurry that is consistent with State of New York groundwater monitoring well decommissiong guidance. The well's protective casing will be pulled as grout is added to the evacuated space and the concrete pads will be broken up and added to any debris that is staged for removal. Assurances need to be provided that the existing or future contaminants will not migrate via these established preferential pathways (i.e., the former monitoring well locations). Revise the Report to indicate what procedures were implemented to meet current NYSDEC guidance on abandonment of monitoring wells.

Response 1: The report requires no revision. Monitoring wells were removed as is described in Section 3.4.9 of the Construction Completion Report.

Each of the removed wells was located in close proximity to one of the disposal pit excavations (Pit A, B, C1 and C2) that was opened to recover military-related items and to remove other debris and waste that had been buried within SEAD-12 during the Army's occupation and use of the property. The depth of the excavations created to remove the wells was the same as the disposal pit excavations, as both excavations extended from grade surface to bedrock; the notable difference was that the excavations created to remove the wells covered less area than the large pit excavations that were needed to recover the military-related items and other forms of debris.

All of the excavations, regardless of whether they were used for well removal or for military-item/debris recovery were backfilled and regraded using equivalent methods, materials, and means during a single site-wide restoration activity. Therefore, the locations of the former wells have a no greater potential to

represent a preferential pathway for migration than do the larger pit excavations; in fact, it is more likely that the larger disposal pit excavations have a greater potential to pose a preferential pathway then do the small well removal locations just based on areal dimensions. Furthermore, the buried materials previously contained in the historic burial pits were the likely source of the alleged contamination that might move through the supposed preferential pathways, and these sources have now been removed as is documented in the Construction Completion Report. These potential sources have been removed, and the results of new sampling and analysis and an updated risk assessment (See response to Comment 3 below) indicate that there are no unacceptable levels of risk associated with the historic disposal pit locations.

Comment 2: The report does not clearly substantiate that excavation chemical confirmatory sampling presented in Section 3.4.6.1, Conventional Chemical Analysis, was followed. For example, this section states, "Excavation perimeter samples were taken at locations approximately 1 to 2 feet back from the edge of the pit excavations, adjacent to location of pit sidewall samples;" however, excavation perimeter samples locations depicted on Figure 3-2, Confirmatory Sample Locations, are not consistent with this statement. Specifically, excavation perimeter sample location S12EXPR-0-8-02 does not appear to be correlated with a sidewall sample. In addition, Figure 3-10, Disposal Pit C2 Final Sample Locations from Sept-Oct 2009, includes multiple sidewall soil samples with no correlating perimeter samples. Further, the floor soil sample locations presented in the Report figures do appear to be grid-specific. Revise the Report to address all sample locations discrepancies and present a clear description of sampling activities to support the proposed unrestricted land use scenario at the site.

Response 2: A sidewall sample, S12EXSW-O-8-02 was collected from a location near S12EXPR-O-8-02 as is now shown on Figure 3-2. The original label and symbol for sample location S12EXSW-O-8-02 was inappropriately removed from the initial figure due to it being super-imposed over the other label rendering both illegible. The sample result data were provided in Appendix A of the Draft Construction Completion Report. New figures of the disposal pit excavations are provided in the Draft Final Construction Completion Report to enhance clarity and readability. Additionally, the identified text in Section 3.4.6.1 has been changed as shown below.

> Subsequent to the completion of the initial excavations at the historic burial pits and before the temporary suspension of work activities, confirmatory soil sampling was performed to verify that conventional chemical hazardous substances (i.e., not radiological) were not present at levels in excess of acceptable levels. Confirmation sampling was done separately for chemical and radionuclides contaminants of concern (COCs and RCOCs, respectively), with the sampling and analysis of chemical COCs done first. Confirmatory sampling and analysis for RCOCs was conducted once the results for the chemical COCs were received, reviewed, and verified to comply with the desired cleanup levels.
>
> Confirmatory soil samples from the base of the excavation were collected as a discrete grab sample from a unique location at a frequency of one sample per 2,500 square feet (sf) or less of excavation bottom, in accordance with the FSP (Parsons, 2008a). At locations where the base of excavation was greater than 2 feet below the adjacent ground surface, sidewall samples were collected at a rate of one soil sample for every 50 linear feet (lf) or less. Sidewall samples were collected at a depth halfway between the base of the excavation and the adjacent ground surface or sloped bench elevation. Excavation perimeter samples were

taken at locations approximately 1 to 2 feet back from the edge of the pit excavations, adjacent to the location of excavation pit sidewall samples. The minimum number of confirmatory samples required for each excavation is listed in **Table 3-1**. The location of the initial confirmatory soil samples collected from four excavation pits (A, B, C1, and C2) are shown on **Figures 3-2**, **3-3**, and **3-4** for Pits A/B, C1, and C2, respectively.

The floor samples previously shown in Figure 3-10 are correctly aligned within the grid cells; the location of the sample labels may have confused the reviewer. Again, new versions of Figures 3-8 through 3-10 are provided in the revised Report to enhance readability and legibility of the information.

A review of the new sample collection presentations indicates that the grid IDs included as part of the sample ID for samples S12EXSW-K-4-01 and S12EXPR-K-4-01 do not correspond correctly to their actual grid locations. This error likely arose due to field personnel misidentifying a grid stake during sample collection. Nevertheless these samples are appropriately positioned on the figure based on survey data, and their sample identities are unique. The original sample identities have been retained to ensure data traceability.

There are two sidewall samples that are not collocated with perimeter samples: S12EXSW-I-2-03 and S12EXSWJ-2-02. Field personnel indicate that failure to collect these samples was an oversight.

Comment 3: The Report indicates that it is the Army's intention to prepare a Proposed Plan and Record of Decision (ROD) that calls for no further action at the site that will ultimately be released for unrestricted use, based, partially on the results of chemical analysis of soil samples collected from the excavations. However, the Report does not include an adequate resolution of organochlorine pesticides concentrations in soil samples collected from Pits C1 and C2 which exceed NYSDEC Unrestricted Use Soil Cleanup Objectives (SCOs), and the various metals analyses and associated calculated 95% UCLs. Revise the Report to include a residual risk assessment that determines the residual site risk that remain in site soils and demonstrates that it is within EPA's risk management range for unrestricted use.

Response 3: An update to the risk assessment prepared during the SEAD-12 Remedial Investigation has been prepared and is included as Appendix H of the Construction Completion Report. A summary of the risk assessment results are provided in a new section 3.6, and the prior Section 3.6 has been renumbered to Section 3.7. This summary indicates that site risks associated with exposure to soil that remains at the site today is still within or below the EPA's accepted range of human health risk and hazard.

Comment 4: The Report specifies that waste disposal samples of stockpiled waste material were collected and submitted for radiological and chemical constituents of concern (COCs) characterization analysis prior to disposal. The Report states that radiological sampling occurred at a rate of one sample per every 200 cubic yards (cy), while COC characterization analysis sampling occurred at a rate of one sample per every 700 cy. Specifically, how these two different volume-based sampling frequencies were implemented was not included in the Report. Revise the Report to include a more detailed accounting of how the stockpiled waste materials were sampled, if TSCA regulated media was generated and how mixed waste was handled.

Response 4: The first paragraph under the header "Six-inch Minus cut Stockpile from Pits A, B, and C2" on page 3-10 has been changed to read as follows:

> Samples of the six-inch minus waste soil cut from materials excavated from Pits A, B, and C2 were collected on August 6, 2009 and submitted to CAS Inc. for waste disposal characterizations. In accordance with the requirements and specifications identified by representatives of the Seneca Meadows Landfill, waste disposal samples for chemical COCs were collected at a frequency of one per every 700 cy of stockpiled waste material. Samples of the stockpile waste soil were also collected for radiological analyses at a frequency of one per every 200 cubic yards as specified by the intended landfill recipient.
>
> Prior to sampling, the volume of the six-inch minus waste soil windrow was estimated by surveying its extent and height using GPS. These survey coordinates were superimposed over previously defined site elevation survey data and the volume of the six-inch minus stockpile was estimated. Waste characterization sample locations were then randomly sited across the length and width of the waste soil windrow, and samples for characterization of radiological and chemical waste characteristics were collected from sample depths varying from 2 inches to 2 feet below grade surface. As the material contained in the waste soil windrow was comprised of soil and fill that had been handled and mixed several times (i.e., excavated, moved to the laydown area, scanned, hand sorted, picked up for processing through mechanical screen, laid out and sorted again if mechanical screen radiation scanner alarmed, picked up, and staged pending analysis), these materials were considered to be well mixed within the windrow. Since the number of radiological samples required exceeded the number of samples needed for conventional waste characterization purposes per the requirements of the receiving landfill, the locations of the radiological samples were used as the primary sample locations and the necessary conventional waste characterization samples were collected from selected radiological sampling locations that scattered throughout the windrow. .
>
> All waste characterization analytical results obtained were reviewed by the Army, Parsons, and Cabrera Services upon receipt and once the data were found not to contain any unanticipated levels of chemical or radiological contamination, it was provided to representatives of Seneca Meadows Landfill for review and pre-approval prior to it being loaded onto trucks for transport to the off-site facility for disposal. None of the analytical determinations showed evidence of TSCA regulated materials or levels of radiation that were not within the landfill's permitted levels to receive.

SPECIFIC COMMENTS

Comment 1: Section 2.7, Establishment of Work and Staging Areas, Page 2-4. The Report states, "Ditch checks were installed on the down stream end of road side ditches;" however, it was not clear where precisely these were located, and if sediment controls were used to protect creek identified in Section 1.3.2, Site Conditions. Revise the Report to include addtitional details sediment controls used to protect the creek located at SEAD-12.

Response 1:

The second paragraph of Section 2.7 on page 2.4 has been revised as is shown below.

> The construction entrance road extended through the north to south tree line where it extended into the work zone, passing immediately south of the location of Burial Pit C2. Beyond the tree line, the defined construction roadway gave way to meandering vehicular routes that marked how the construction vehicles passed from and around the excavation work zone to the support areas. Each of the excavation sites was

bounded and marked with a 4-foot high orange construction fence that was installed around its perimeter as a safety measure.

Silt fences constructed of 2-foot high fabric mounted on wooden stakes were installed between the work and support zones and the wooded area that borders the work/support areas to the south as well as around the staging and handling (support) area, access roads, and along the road side ditches that parallel Service Road No. 1. Ditch checks constructed of hay bales were installed on the down stream ends of both of the drainage ditches that border Service Road No. 1 upgradient of the location where they discharge into the unnamed creek. The approximate locations of silt fences and ditch checks are shown on **Figure 2-1**.

Comment 2: Section 2.9, Control of Run-On and Run-Off Waters, Page 2-5. This section does not address daily inspection and repair of run-on, run-off and erosion controls. Revise this section to document the daily inspection and repair procedure that took place during the course of the project, including the source of the additional water generated during the removal activities performed.

Response 2: The following sentence will be added to Section 2.9: "The run-on, run-off, and erosion control measures were inspected daily and minor repairs were completed, as needed."

Comment 3: Section 2.10, Establishment of Erosion and Sedimentation, Page 2-6. The Report states, "Temporary erosion control measures were removed following remediation so as to return drainage patterns to their general conditions prior to remediation;" however, erosion control measures (e.g., seeding) do not actually have an effect on drainage patterns and, therefore, this statement was not clear. Section 3.4.14, Site Restoration, indicates the erosion control measures were completed after remediation (i.e., the site was seeded with winter wheat). Further, Section 3.4.14 states that, "These erosion and run-off controls will remain in place until post-construction inspections confirm that vegetation has been established in disturbed areas." Revise the Report to address these discrepancies.

Response 3:

Section 2.10 has been modified to read as follows:

Erosion and sedimentation controls, such as silt fencing and hay bales, were installed in downgradient areas during operations to prevent migration of sediments and erosion. Prior to beginning any excavation work, temporary silt fencing was erected between the work area (i.e., Disposal Pit sites and the support/laydown area) and downgradient surrounding areas (i.e., wooded and the unnamed creek to the south and drainage ditches bordering Service Road No. 1 to the west) to prevent contaminated sediment transport. As discussed in **Section 2.4**, hay bale ditch checks were also installed in the two drainage ditches that run on either side of and parallel to Service Road No. 1 at locations upgradient of where the drainage ditches discharge into the southeast-to-westerly trending unnamed creek that flows to the south of the historic burial pit site. The temporary silt fencing was maintained throughout the project and will not be removed until permanent vegetation has been re-established.

Temporary erosion control measures, including excavation slope stabilization benches, soil berms and swales exterior to the excavations, and silt fence emplacements were constructed around each of the open excavation sites to control surface water run-on/run-off and soil migration to outlying areas. Additionally,

once excavated soils was placed into the Overburden/C1 stockpile, temporary silt fencing was added to the east, north, and northwest of this area to prevent sediment migration into lower lying areas.

Section 3.4.14 has been modified to read as follows.

No off-site borrow material was used to backfill or regrade the disposal pits. Pits A and B and associated monitoring well locations were backfilled using soil from the "Overburden/C1" stockpile. Analytical results for these soils are discussed in Section 3.5.1 Overburden / C1 Stockpile discussion, below. Excavations at Pits C1 and C2, and monitoring well locations associated with these pits were backfilled by pushing native soil from high areas surrounding the excavation areas back into the excavation locations and grading to promote positive drainage away from the sites. During the backfill and regarding operations, the temporary silt fence located to the east, north, and northwest of the Overburden/C1 stockpile was removed and disposed at the licensed landfill. Additionally, excavation site stabilization benches, temporary soil berms, and storm water diversion swales created around each of the excavation pit sites were also regraded to promote positive flow throughout the former work areas.

Once all of the excavation sites were backfilled and graded, all areas were raked and seeded on November 2 and 3, 2009 with winter wheat to promote vegetation and to prevent erosion.

The erosion and run-off controls established between the work/support/laydown areas and the wooded area and creek to the south and the drainage ditches to the west along Service Road No. 1 were left in place, pending the revegetation of the work/support area sites.

Comment 4: Section 3.3, Dust Control Monitoring, Page 3-2. According to this section, air monitoring measurements were collected during the first month of the project; however, the results have not been provided in the Report. In addition, the daily reports included in Appendix A do not indicate that air monitoring equipment was on-site during this period of time. Revise the Report to include information on the air monitoring results and address the discrepancy between the daily reports and the information presented in Section 3.3.

Response 4: The daily reports covering the initial month of work at the site when the majority of the excavation, sorting, and screening work was conducted have been amended to reflect the presence of dust monitors at the site.

Section 3.3 has been revised as is shown below.

Air monitoring measurements were collected periodically during the first month of the removal action (July 13 – August 14, 2009), during periods when the greatest amount of excavation and material handling activities occurred. The data collected during the monitoring events are presented in Appendix CCC. The presented data show that fugitive dusts were not identified as a concern during this phase of the work due to the low number and slow operating speeds of site vehicles (e.g., articulated trucks, excavator, dozer, etc.). Furthermore, the clay-till composition of the native soil materials found at the site tends to clod which inherently reduces windborne dust levels. The professional judgments of the site manager and site health and safety officer dictated when conventional methods of dust suppression (e.g., water spraying) were used to control dust generated during construction.

Comment 5: Section 3.3, Dust Control Monitoring, Page 3-2. The text states that, "When necessary, conventional methods (e.g., water spraying) were used to suppress potential dust generated;" however, it was not clear how the determination was made to use these methods, given that air monitoring only

occurred from July 13 – August 14, 2009. Revise the Report to clarify how it was determined that dust control measures were used at the site.

Response 5: See Response to item 4 above.

Comment 6: Section 3.4.1, Pit Excavations, Page 3-4. The text states that, "Soil removal done to promote sidewall and slope stability resulted in the excavation of native soils from beyond the edge of the former burial pit debris cache;" however, it was not clear if these areas were included in the "limits of the excavation" shown in Figures 3-1 through 3-7. In addition, Figures 3-8 and 3-9 include labels for "Excavation Work Area" and "Approximate limits of debris cache", and it was not clear if either of these include the benching described in Section 3.4.1. Revise this section, or the figures, if necessary, to clarify the extent of the excavations; clear, unequivocal presentation of the limits of excavation and radiological screening should be presented in the Report to support the eventual release of the site for unrestricted use.

Response 6: The features on Figure 3-2 previously labeled as "Disposal Pit A", "Disposal Pit B", "Disposal Pit C1", and "Disposal Pit C2" have been removed and replaced by the Limit of Excavation feature shown on Figure 3-1. In addition, the item in the legends of Figures 3-1 through 3-7 previously identified as "Limit of Excavation" has been renamed as "Limit of Excavation including slope stabilization bench". The features identified in the Legend of Figures 3-8, 3-9, and 3-10 have been renamed as "Limits of Excavation including slope stabilization bench".

Comment 7: Section 3.4.10, Additional Burial Pit Excavations, Page 3-17. This section states, "***Figure 3-2*** [emphasis added] presents the results of the EM-31 surveys;" however, this information is not provided on Figure 3-2, but rather Figure 3-3. Revise this section to correct this reference.

Response 7: The noted correction will be made in the text; however, due to the renumber of other figures this Figure is now identified as Figure 3-5.

Comment 8: Section 3.4.10, Additional Burial Pit Excavations, Page 3-17. This section indicates that material was excavated from grid cell K4; however, it was not clear why additional soil was removed from K4. The area in immediate vicinity of K4 did not have any anomalies noted in Figure 3-3, Limits of Initial Excavation (2009 In-Phase EM Data), nor did it appear that this would be a location where soil benching was necessary. Revise this section to address this discrepancy.

Response 8: The text on pages 3-17 and 3-18 has been revised as is shown below. Cell K4 was improperly identified in the prior text due to the author's improper identification of the grid cell locations in the low pair of figures that were displayed on the original Figure 3-5.

Pit C2 Excavations

As part of the initial "mag +dig" surveys, the survey team identified a large metal anomaly beneath the surface of the ground to the northeast of Pit C2 (in grid cell J3). When this anomaly was investigated, a large metal object was uncovered, which subsequently was removed using the excavator (due to its size). During this removal operation, a larger cache of buried debris was uncovered beneath the initial object and as a result, a satellite excavation extending into grids I3, I4, J3 and J4 (including benching) was created

adjacent to Pit C2 from which approximately 70 cubic yard of material was excavated, and transported to the materials handling and processing area, where it was laid out on plastic, scanned and processed to remove all radiological items, identified military-related items, and other forms of miscellaneous debris. Once all debris and items of interest were recovered and secured, the waste soil was staged for subsequent disposal at the off-site landfill.

Once the EM-31 surveys were performed around Pit C2, additional buried objects were identified in previously unexcavated areas immediately surrounding Pit C2 (in grid cells I2 and J2), at other locations between Pit C1 and C2, and to the south-southeast of Pit A. **Figure 3-5** presents the results of the EM-31 surveys conducted after the initial excavations at each of these were cleared and samples were collected. Each of the identified areas showing an EM-31 response suggesting buried objects were subsequently investigated by field crews. Investigation of anomalies identified in grid cells I2 and J2 resulted in the excavation of another 300 cubic yards of material from grid cells G2, H2, I2, J2, K2, G3, H3, I3, H4, I4, and J4 (including stability benching, see **Figure 3-7**, all of which was transported to the materials handling and processing area where it was laid out on plastic, scanned for evidence of radiation, manually sorted, debris and soil separated, recovered debris presented for inspection by Army personnel, and then segregated as either radiological materials (secured in B-25 boxes), military-related items secured by the Army, or added to the recycle, C&D/miscellaneous debris stream, or added to a soil stockpile for load out to the local off-site landfill. Additional excavations around Pit C2 took place during the period from October 5 to October 13, 2009. Confirmatory sampling and analysis for COCs and RCOCs were performed in the expanded pit area on October 5, October 7, and October 15, 2009. The extent of the additional excavation in Pit C2 can be seen in **Figure 3-7**.

Comment 9: Figure 3-2, Confirmatory Sample Locations. The limits of the excavation depicted in Figure 3-2 are not conistent with the limits depicted in Figure 3-1. Limits of Initial Excavation (July 22, 2009). In addition, excavation depths are not included on Figure 3-2 and therefore, it is difficult to review the appropriateness of soil sampling locations, in particular, the locations of sidewall samples. Revise this section or Figure 3-2 as necessary to clarify the excavation limits.

Response 9: The feature previously labeled as "Limits of Excavation" on Figure 3-2 has been replaced with the "Limits of Excavation" feature previously shown on Figure 1 and relabeled in the legend at "Limit of Excavation including slope stabilization bench". This same legend terminology has been applied to all subsequent maps that show excavation locations and geophysical data or sample locations.

Army's Response to Comments from the New York State Department of Environmental Conservation

Subject: Draft Construction Completion Report
Radiological Waste Burial Pits (SEAD-12)
Seneca Army Depot
Romulus, New York

Comments Dated: June 3, 2010

Date of Comment Response: July 19, 2010

Army's Response to Comments

GENERAL COMMENTS

Comment 1: State noted that several collected Confirmatory samples exceeded from State Soil Cleanup objectives but barely the State is satisfied with the results. Please revise the sections in report as necessary to clarify that the objectives were met in this remediation.

Response 1: Appropriate sections of the Revised Report will indicate that the cleanup objectives were achieved.

Comment 2: Please revise the report to indicate what procedures were implemented, used to meet current NYSDEC guidance for abandonment of monitoring wells.

Response 2: The wells were removed from the site as is described in the text provided. The former well locations do not represent any greater preferential pathway than do the larger surrounding excavation sites opened for the removal of military-related items and other debris, since the excavations went to the same depth (bedrock) below grade, were through the same lithological materials (i.e., clay, till and fill) and were all backfill at the same time, using the same methods, and materials. Furthermore, the removal action conducted in this area removed the only known and most logical source of residual contamination that remained at this site. The new analytical results indicate, as NYSDEC has indicated above in General Comment 1, that the soil cleanup objectives were met; therefore there is no potential for groundwater contamination to occur. The well installations were removed during the removal action once it became apparent that their metal components of construction (i.e., bollards, protective casings, etc.) were "blinding" geophysical survey equipment that was being used to confirm that all buried debris in the vicinity of each of the larger pits had been excavated. Each of the installations was removed using the excavation equipment that was available at the site, as part of the overall site excavation and were not treated separately.

Comment 3: Samples collected from Waste disposal samples, at what rate of occurred or at a rate of one sample per every 700 cy or what.

Response 3: Samples were collected at a rate of 1 per every 200 cubic yards for radiological analytes, and one for every 700 cubic yards for conventional chemical waste characterization actions.

In addition, based on EPA comments the section entitled "Six-inch Minus Cut Stockpile for Pits A, B, and C2"presented on Page 3-10 has been modified as is shown below.

> Samples of the six-inch minus waste soil cut from materials excavated from Pits A, B, and C2 were collected on August 6, 2009 and submitted to CAS Inc. for waste disposal characterizations. In accordance with the requirements and specifications identified by representatives of the Seneca Meadows Landfill, waste disposal samples for chemical COCs were collected at a frequency of one per every 700 cy of stockpiled waste material. Samples of the stockpile waste soil were also collected for radiological analyses at a frequency of one per every 200 cubic yards as specified by the intended landfill recipient.
>
> Prior to sampling, the volume of the six-inch minus waste soil windrow was estimated by surveying its extent and height using GPS. These survey coordinates were superimposed over previously defined site elevation survey data and the volume of the six-inch minus stockpile was estimated. Waste characterization sample locations were then randomly sited across the length and width of the waste soil windrow, and samples for characterization of radiological and chemical waste characteristics were collected from sample depths varying from 2 inches to 2 feet below grade surface. As the material contained in the waste soil windrow was comprised of soil and fill that had been handled and mixed several times (i.e., excavated, moved to the laydown area, scanned, hand sorted, picked up for processing through mechanical screen, laid out and sorted again if mechanical screen radiation scanner alarmed, picked up, and staged pending analysis), these materials were considered to be well mixed within the windrow. Since the number of radiological samples required exceeded the number of samples needed for conventional waste characterization purposes per the requirements of the receiving landfill, the locations of the radiological samples were used as the primary sample locations and the necessary conventional waste characterization samples were collected from selected radiological sampling locations that scattered throughout the windrow. .
>
> All waste characterization analytical results obtained were reviewed by the Army, Parsons, and Cabrera Services upon receipt and once found not to contain any unanticipated levels of chemical or radiological contamination, it was provided to representatives of Seneca Meadows Landfill for review and pre-approval prior to it being loaded onto trucks for transport to the off-site facility for disposal. None of the analytical determinations showed evidence of TSCA regulated materials or levels of radiation that were not within the landfill's permitted levels to receive.

SPECIFIC COMMENTS

Comment 1: Section 3.4.10, Page 3-18 "Fig 3-2 presents the result s of the EM-31 surveys conducted ....." please revise the figure to show the results.

Response 1: The noted correction will be made in the text; however, due to the reorganization of other report figures, this figure is now identified as Figure 3-5.

Army's Response to Comments from the United States Environmental Protection Agency

Subject: Draft Final Construction Completion Report
Radiological Waste Burial Pits (SEAD-12)
Seneca Army Depot
Romulus, New York

Comments Dated: September 3, 2010

Date of Comment Response: December 10, 2010

Army's Response to Comments

GENERAL COMMENTS

Comment 1: The Human Health Risk Assessment (HHRA) included in Appendix H and summarized in Section 3.6 (Updated Remedial Investigation Human Health Risk Assessment) of the Draft Final Construction Completion Report for the Removal Action at the Waste Burial Radiological Sites (SEAD-12) (CCR) is incomplete as the cancer risk from both radionuclides and chemical carcinogens has not been summed to provide an estimate of the combined risk presented by all carcinogenic contaminants as specified in OSWER Directive 9200.4-18, August 1997, Establishment of Cleanup Levels for CERCLA Sites with Radioactive Contamination and EPA's 1989 Risk Assessment Guidance for Superfund, Part A. Neither Appendix H nor Section 3.6 have discussed the contribution of radionuclide cancer risk to the overall total risk from each exposure area. This is confirmed upon detailed review of Appendix H where all the tables list only chemical contaminants; no radionuclides are listed or discussed. This is a significant oversight in the CCR and has presented an underestimate of the total risk at the site. In order to support risk management decisions at the site, the HHRA should be revised to include the sum of both radionuclide and chemical risks.

Response 1: The Army conducted a final status survey (FSS) in accordance with procedures identified in MARSSIM, and the results of this survey indicate that residual soil levels of radionuclides found at the excavated disposal pit locations are below derived concentration guideline levels (DCGLs) that were derived based on a resident farmer exposure scenario. Therefore, it is the Army's understanding that potential risks attributable to radionuclides do not have to be included in the risk assessment calculation, per the following communication.

> "The final status survey (FSS) is conducted after the completion of remediation as a confirmatory survey to make sure that the contaminants have been removed and that there are no contaminants remaining that exceed the action level. The action level is usually derived to meet an acceptable risk criteria. If all final status survey data are below the action level, then you have met the cleanup objective of meeting an acceptable risk and there is no need to perform a risk assessment.

> However, if there are residuals exceeding your action level and they can't not be removed for legitimate reasons, then a risk assessment will need to be performed"[1].

The results of the FSS are summarized in Section 3.5.2 of the SEAD-12 Construction Completion Report, and are presented in greater detail in the radiological consultant's report, which is presented in its entirety in Appendix D of the SEAD-12 Construction Completion Report.

The Army has also reviewed and reassessed the EPA's concerns (See Specific Comment 5, Appendix D below) about the use of backfill at Disposal Pit A/B (refer to Draft Final SEAD-12 Construction Completion Report, Appendix B, Table B-3R) that reportedly contained levels of Radium-226 in excess of derived DCGL. The data previously reported for Radium-226 has been revised. The attached response is provided to address this concern.

> In the Summary of Field Activities Technical Memorandum, Appendix D, Attachment D, section 3.1, analysis of Ra-226 is discussed. The project plan calls for utilizing the 609 keV Bi-214 gamma energy for quantifying Ra-226. The overburden samples results, however, were not reported in this manner. The Bi-214 values in Table B-3R will be used for Ra-226 assuming equilibrium.
>
> Note that the currently reported values for Ra-226 in Table B-3R, also have errors associated with them of +/- 90% of the sample value. This is indicative of the problem with directly quantifying Ra-226 via gamma spectroscopy. Using the Bi-214 with an equilibrium assumption is a preferred method for quantifying Ra-226. Table B-3R failed to incorporate this process as Table B-1R did. Table B-3R will be corrected. All overburden samples are less than project DCGLs using this analysis method.

Comment 2: The summary of the cancer risks and non cancer hazards in Appendix H and Section 3.6 of the CCR have subtracted post-removal risks from pre-removal risks. This presentation is misleading and inconsistent with EPA's 1989 Risk Assessment Guidance for Superfund, Part A. Revise the tables to list the pre-removal and post-removal risks and hazards side by side and remove the column of the risk summary tables entitled (Difference).

Response 2:

The difference column will be removed from the Appendix H presentation.

Comment 3: The Report mentions the Army's intention to prepare a Proposed Plan and Record of Decision (ROD) that calls for no further action at the site and that it will ultimately be released for unrestricted use, based, partially on the results of chemical analysis of soil samples collected from the excavations. However, the Report does not include an adequate resolution of organochlorine pesticides concentrations in soil samples collected from Pits C1 and C2 which exceed NYSDEC Unrestricted Use Soil Cleanup Objectives (SCOs), and the various metals analyses and associated calculated 95% UCLs.

[1] Email from Nidal Azzam, Senior HP, Scientist, USEPA Region 2, DEPP/RIAB to Julio Vazquez, RPM, Region 2 U.S. EPA – Region 2 dated 09/29/2010 that was subsequently forwarded on Stephen Absolom, U.S. Army Corps of Engineers, Seneca Army Depot Activity.

Revise the residual risk assessment included in Appendix H so that it incorporates the levels of metals and organochlorine pesticide concentrations in site soils used for backfill in order to demonstrate the final site risks are within EPA's risk management range for unrestricted use.

Response 3: The human risk assessments conducted for SEAD-12 (Pit A/B, and C [including both C1 and C2]) did evaluate potential hazards and or risks that may result due to the residual levels of organochlorine pesticides and metals that remained at the various disposal pit excavation sites at the completion of the removal action. Initially, the maximum detected concentration for all compounds detected in the soil at either of the disposal pit locations (A/B or C) at the completion of the removal action were initially screened against EPA guidance levels, and any compound found at a level in excess of the guidance value was retained for further consideration in the risk assessment. The EPA guidance levels used were either the residential soil Regional Screening Level (RSL) at full concentration for carcinogenic compounds, or the residential soil RSL at one-tenth the listed concentration for non-carcinogenic compounds. Any compound that exceeded the screening level, or for which there was no screening value, was retained for further evaluation under the risk assessment. This process is shown in Appendix H Attachment A and B, Table 2 for Disposal Pit A/B and C, respectively.

For metals only, a secondary screening step was also then applied to select the metals that were finally evaluated in the risk assessment. This secondary step involved the comparison of the individual disposal pit dataset to the Seneca background dataset, as had been done during the risk assessment completed during the remediation evaluation. This comparison was performed using the Wilcoxon Mann Whitney (WMW) test that is inherent within the EPA's ProUCL 4.00.04 software. Under the WMW test all reported concentrations for the disposal pits (A/B or C) and the SEDA background results are rank-ordered from lowest to highest, and then the Mean/Medium of the disposal pit's datasets is compared to comparable statistic for the SEDA background dataset. If the disposal pit result is lower than or statistically no different than (statistically indistinguishable) the SEDA background value, the metal was eliminated from further consideration in the risk assessment as possible effects can not be distinguished from those that result from background levels of the metals in the native soils. Only those metals that were shown to be at concentrations above background levels were then carried forward in the risk assessment that was conducted after the removal action. The results of the WMW tests are presented in Appendix H, Attachments A and B, Table 3 respectively for Disposal Pit A/B and C. The compounds retained and carries through the risk assessment process are summarized in Table 4, of Appendix H, Attachment A and B respectively for Disposal Pit A/B and C.

Following this approach, none of the organochlorine pesticides detected in samples from Disposal Pit A/B or in the backfill materials used at these sites were found to exceed EPA screening levels. At Disposal Pit C, alpha-BHC was found at a concentration above its EPA screening value, while there is no screening value identified for delta-BHC. On this basis both of these organochlorine pesticides were carried through the risk assessment process for soil. With reference to the metals, only sodium and thallium were retained an assessed during the risk assessments for soil.

Comment 4: The CCR indicates in Section 1.3.1, Location (Page 1-5) that there are four disposal pits that include A, B, C1 and C2; however, the risk assessment appears to have combined A and B as one exposure unit and C1 and C2 as a second exposure unit. The rationale for combining the four pits into two exposure units has not been provided. The HHRA should be revised to provide the rationale for evaluating the 4 pits as two exposure units.

Response 4: Section 1 of the *Technical Memorandum, Updated Risk Assessment, Radiological Waste Burial Sites* has been changed to read as follows to provide a transition describing why the four former disposal pts were evaluated as two separate exposure units in the risk assessment process (underlining indicates altered text).

> Parsons Infrastructure & Technology Group Inc. (Parsons) has prepared an update to the baseline human health risk assessment previously prepared for SEAD-12, the Radiological Waste Burial Sites, as part of the remedial investigation (RI) in 2002 (Parsons, 2002). The update was conducted to assess whether any change in risk occurred in the areas of historic disposal pits (Pits A, B, C1 and C2) that were excavated by the Army during the summer and fall of 2009 to recover military-related items and other forms of debris that were buried at the site during the Army's ownership and occupation of the property.
>
> After SEDA was listed as a National Priorities List (NPL) Site by EPA, the Army identified two areas within the former Weapons Storage Area (WSA) of the Depot as areas where hazardous substances had been handled by the Army and other tenants and possibly released to the environment. These areas were generally described as Radiological Waste Burial Pits and were designated as SEAD-12A (area north of Building 813) and SEAD-12B (area north of building 804). Geophysical investigations conducted as part of the Expanded Site Inspection identified the locations of the suspected burial pits at SEAD-12A and SEAD-12B. The geophysical investigation of SEAD-12A suggested that there were four burial areas, initially identified as Areas 1 – 4 located within the northeastern corner of the former WSA where burial pits were likely to exist. Burial pit locations 1 – 4 subsequently were designated as Disposal Pit A, B, C2, and C1, respectively during continuing site investigations. Subsequent to the identification of the suspected burial pits, test pits were dug to characterized materials that were contained in the pits, and soil, sediment, surface water and groundwater were collected from the region around the four identified burial areas, and the results obtained from the analysis of these samples suggested that there were hazardous substances present. Based on these data and results, the Army developed plans for a larger scaled remedial investigation of the sites.
>
> During the planning stages of remedial investigation (RI) for SEAD-12A and SEAD-12B, the Army conducted reviews of information and data contained in Depot files, and concluded that other areas within the greater WSA also had the potential to be sites where materials equivalent to those identified in SEAD-12A and SEAD-12B had been historically handled. Based on this determination, the Army expanded the scope of the RI beyond the bounds of SEAD-12A and SEAD-12B and conducted more extensive geophysical, chemical, and radiological investigations of the land within the greater WSA. The expanded investigation of the WSA resulted in the Army's decision to re-define SEAD-12 as a 360-acre site that extended from a southern boundary line, set just north of the Row A0300 storage igloos, outwardly to the western, northern, and

eastern perimeter security fences surrounding the WSA, exclusive of land previously designated as SEAD-63 (the Miscellaneous Component Burial Site) that is sited roughly halfway up the western border of WSA.

The results of the RI for SEAD-12 indicated that there were nine subareas of SEAD-12 that exhibited varying levels for potential hazardous substance release. These nine areas were identified as:

- Building 819 and EM-27;
- Building 815, Building 816, and EM-28;
- Disposal Pits A/B (a portion of the former SEAD-12A including burial pit areas 1 and 2, re-designated as Disposal Pit A and B);
- Disposal Pit C (a portion of former SEAD-12A including burial pit areas 3 and 4, re-designated as C2 and C1);
- Dry Waste Disposal Pit (former SEAD-12B);
- EM-5;
- EM-6;
- Open areas; and
- Building 715 Wastewater Treatment Plant.

At the conclusion of the RI, the Army prepared human health and ecological risk assessments for three of the nine areas identified in SEAD-12. These areas included Disposal Pit A/B, Disposal Pit C, and the Former Dry Waste Disposal Pit (previously designated as SEAD-12B). "These three areas were selected on the basis of site evaluation criteria including areas of documented activity associated with WSA activities; areas where RI investigations (geophysical and text pitting operations) confirmed significant 'military' activity, and proximity to buildings associated with activities of potential concern. Overall, the Former Dry Waste Disposal Pit area, Disposal Pits A/B, and Disposal Pit C were impacted to the greatest extent by historic activities in the Former Weapons Storage Area (SEAD-12)"[2]

In the summer and fall of 2009, the Army excavated the historic burial pit areas 1 – 4 (re-designated as A, B, and C including C2 [ESI area 3], and C1 [ESI area 4], respectively) to provide access to materials that were previously buried at the sites. The goal of this work was to allow the Army to recover, secure, demilitarize, and dispose of any military-related items that were present in the burial pits to ensure that they could not accessed in the future by future users/owners of the SEAD-12 property. During the recovery of the military-related items and other debris that was found in the historic approximately 5,400 cubic yards of material was excavated. After the military-related items and other debris was separated from the soil and fill that surrounded it, soil samples were collected and analyzed and the resulting data ~~was~~were used to assess if any of the excavated soil/fill could be re-used as backfill at the excavation sites. Based on the analysis of this data, approximately 2,300 cubic yards of soil was used as backfill at the locations of historic burial pits A and B. In addition, confirmatory soil samples were collected from the base, sidewall, and

[2] Section 6 "Human Health Risk Assessment", Page 6-1, 3rd paragraph, *Final Remedial Investigation Report at the Radiological Waste Burial Sites (SEAD-12)*, Parsons, August 2002.

perimeter of all of the excavation sites to verify that no unacceptable levels of residual risk remained at the sites.

The Army intends to transfer all of the land within SEAD-12, including the areas of the former Disposal Pits, for non-military reuse purposes. At present, a tenant is occupying some of the facilities within the bounds of SEAD-12 for commercial purposes, and this tenant has indicated that they may want to expand their operations in the future to include the land that is currently within the area where the historic burial pits were previously located. The Army has used the new analytical data developed from soil samples collected from the area of the historic disposal pits to update the previously accepted risk assessments for Disposal Pits A/B and C during the RI.

All estimations of risk or hazards previously determined for human receptors exposed to groundwater, surface water, or sediment within the SEAD-12 site remain as they were reported in the 2002 Remedial Investigation Report at the Radiological Waste Burial Sites (RI Report, Parsons, 2002). No samples of these three media were collected during the SEAD-12 Removal Action, and thus the data has not changed. Estimates of hazards and risks resulting from human exposure to these media have been incorporated directly from the SEAD-12 RI Report.

Section 2 of this memorandum provides background information for the risk assessment, section 3 identifies and presents the data used for the risk assessment, sections 4 through 7 summarize each step of the four-step risk assessment process (i.e., hazard identification, exposure assessment, toxicity assessment, and risk characterization), section 8 discusses the risk uncertainties associated with the risk assessment, section 9 lists reference materials used. Discussions presented in each of these sections focus predominantly on changes that result due to the update of the location-specific soil datasets used.

Comment 5: It is unclear why the excavations at the historic disposal pits were delineated based on SCOs when the human health risk assessment (HHRA) used the lower of EPA's Regional Screening Levels (RSLs) or the SCOs. As a result, it is unclear if the extent of the excavations is adequate since the RSLs for many of the compounds are significantly lower than the SCOs. For example, the RSLs for the carcinogenic polycyclic aromatic hydrocarbons (PAHs) are three to four orders of magnitude lower than the SCOs. Clarification is required as to why EPA screening levels were not considered when delineating the extent of excavations. Ensure that the impact of this approach is also discussed in the sensitivity assessment in the residual risk assessment.

Response 5: Tables 3-6 to 3-10 will be modified to provide comparison of final soil concentrations to EPA's Regional Screening Levels in addition to the State SCOs.

The Army used State of New York SCO levels and background concentrations for metals as the benchmark against which preliminary decisions regarding the completion of removal actions for soil are made. It is the Army experience that achievement of State SCO values is generally necessary to ensure State concurrence with completion of the action, while the risk assessment process is required to attain EPA approval of the action.

During construction, it is the Army's process to assess the effectiveness of soil removal action on an action specific unit-wide or holistic basis (e.g., Disposal Pit A, B, C1, C2 in this case) and not on an

individual sample point-by-point basis by comparing the 95th upper confidence limit of the arithmetic mean (henceforth 95th UCL) of the specific unit-wide soil dataset to the State SCO or background level for metals. Under this approach, individual sample points may remain at concentrations that exceed State SCOs and EPA RSLs, but the 95th UCL are below or roughly equivalent to levels that will be accepted by the State.

The risk assessment process used by the Army evaluates all data for contaminants detected against a set of modified EPA RSLs for residential exposures. The RSLs for the residential exposure are modified by comparing listed values that are reduced by a faction of 10 (i.e., RSL divided by 10 or multiplied by a factor of 0.1) for non-carcinogenic compounds or at face value for carcinogenic compounds.

Comment 6: As was previously requested, revise the Report to indicate what procedures were implemented to meet current NYSDEC guidance on abandonment of monitoring wells. The response to comments indicates that the monitoring wells were removed in their entirety, since they were on the edges of the excavations. Figures 1-2 and 1-4 of the May 2009 Work Plan for Removal Action at the Radiological Waste Burial Sites (SEAD-12) show that not all of the decommissioned monitoring wells were located in close proximity to the excavation extents. Further, excavation of existing monitoring wells may not result in an equivalent decommissioning process as what was described as required by the State of New York at SEAD-5. Further clarification is necessary to clearly substantiate that the monitoring wells were removed in a manner consistent with the State of New York's requirements.

Response 6: The 10 wells that were removed during the removal action were removed to allow field personnel to conduct geophysical surveys using Schonstedt and EM-31 survey equipment to identify potential buried metal objects. Initially, these surveys were conducted on areas within a defined 25 to 35 foot buffer zone around each of the disposal pit excavations; however, once buried debris were found within these bounds around Disposal Pit C2, the Schonstedt and EM-31 surveys were conducted throughout the area previously defined as SEAD-12A (i.e., northeast corner of the WSA, extending from the northern and eastern security fence lines to the eastern edge of Service Road No. 1, and the northern boundary of the wooded area to the south of the site.

The bottom of the wells was not punched out, and grout was not added to the well upriser or screened area before they were excavated from the site. During well removal, the excavator was used to dig out the well by opening a test pit that extended from grade level to bedrock. All components of the well were removed and disposed of as C&D debris. The well excavation sites were subsequently backfilled and regraded using native soils surrounding the former well site or fill from the Overburden/C1 pile in a manner that was equivalent to the backfill operations done for the excavated burial pit sites.

Comment 7: The Report does not clearly substantiate that excavation chemical confirmatory sampling presented in Section 3.4.6.1, Conventional Chemical Analysis, was followed. For example, this section states, "Excavation perimeter samples were taken at locations approximately 1 to 2 feet back from the edge of the pit excavations, adjacent to location of pit sidewall samples." However, Figure 3-10, Disposal Pit C2 Final Sample Locations from Sept-Oct 2009, includes multiple sidewall soil samples with no

correlating perimeter samples. Further, the floor soil sample locations presented in the Report figures do appear to be grid-specific. Revise the Report to address all sample location discrepancies and present a clear description of sampling activities to support the proposed unrestricted land use scenario at the site. If sampling protocol was not followed explicitly, then a discussion of this and the resulting impacts (if any) need to be presented.

Response 7: Section 3.4.6.1 has been changed to read as follows

> Confirmatory soil samples from the base of the excavation were generally collected as a discrete grab sample from a unique location at a frequency of one sample per 2,500 square feet (sf) or less of excavation bottom, except in areas where the excavation extended to the bedrock surface and all soil was removed, in accordance with the FSP (Parsons, 2008a). At locations where the base of excavation was greater than 2 feet below the adjacent ground surface, sidewall samples were collected at a rate of one soil sample for every 50 linear feet (lf) or less. Sidewall samples were collected at a depth halfway between the base of the excavation and the adjacent ground surface or sloped bench elevation. Excavation perimeter samples were taken at locations approximately 1 to 2 feet back from the edge of the pit excavations, adjacent to the location of excavation pit sidewall samples. The minimum number of confirmatory samples required for each excavation is listed in **Table 3-1.** The approximate location of the initial confirmatory soil samples collected from four excavation pits (A, B, C1, and C2) are shown on **Figure 3-2.** The actual placement of sample locations on the map has been moved from survey coordinate locations to promote readability.

Text previously appearing on page 3-23 of the Draft Final Construction Completion Report under the header Pit C2, first paragraph has been modified to read as follows:

> At the conclusion of excavations at Pit C2, 43 confirmatory soil samples were collected and analyzed for conventional chemical COCs. These included eight floor samples (six samples and two duplicates), 15 perimeter samples, and 20 sidewall samples (19 samples and a duplicate). Excavation floor samples were not collected in grid cells I2 and J3 because the excavations in these areas extended to bedrock. Paired sidewall and perimeter samples were not collected at locations S12EXSW-J-2-02 and S12EXSW-I-3-04 due to the gentle slope of the excavations that were present at these locations. A perimeter sample was not collected from grid cell I-2-03 where a sidewall sample (i.e., S12EXSW-I-2-03) was collected from a limited excavation that was opened to remove a cache of debris that was identified during geophysical surveys conducted as part of the final removal action verification activities. Summary analytical results for these samples are provided in **Table 3-9.** The full data set for these samples is provided in **Appendix B Table 1C**. Analytical results for the samples that were excavated are provided in **Appendix B Table 2**. The approximate location of the final confirmatory soil samples is shown in **Figure 3-10**. The actual placement of sample locations on the map has been moved from survey coordinate locations to promote readability.

Comment 8: Modify Table of Contents to include subsections. For example, Section 3.4.6.2 "Radiological Analyses" is missing from the Table of Contents.

Response 8: The Table of Contents will be updated to include all numbered section and subsection headers.

Comment 9: Rename Appendices to avoid confusion between Appendices to the report and Appendices to the Appendix D. Appendices to the report and Appendices to the Appendix D have the same titles.

Response 9:

The names of appendices to the radiological report will be changed to Attachments. The word Appendix in the text of the Cabrera Report will be replaced by "Attachment".

SPECIFIC COMMENTS

Comment 1: Section 3.3, Dust Control Monitoring, Page 3-2: According to this section, air monitoring measurements were collected during the first month of the project; however, the daily report from July 27, 2009 included in Appendix A does not indicate that air monitoring equipment was on-site during this day. Revise the Report as was previously requested to address the discrepancy between the daily reports and the information presented in Section 3.3. Clarifying text should be provided to indicate that in some instances professional judgment resulted in air monitoring equipment not being present on site each day (if this was the case).

Response 1: The Daily Report for July 27, 2009 accurately reflect that dust monitors were not at the site on that day and also notes that the weather for the day included rain. The Site Manager and Site Health and Safety Officer opted not to conduct air monitoring on that day because the weather conditions favored low windborne dust levels. The referenced section has been revised as is shown below.

> Air monitoring measurements were collected periodically during the first three weeks ~~month~~ of the removal action (July 13 – August 14, 2009), during periods when the greatest amount of excavation and material handling activities occurred. Air monitoring frequency decreased once the majority of the disposal pit excavation, transport, and material layout operations, which required more vehicular travel, were completed and site activities moved more into material sorting, screening and staging which involved shorter driving distances and fewer trips. The data collected during the monitoring are presented in **Appendix I**. The presented data show that fugitive dusts were not identified as a concern during the excavation ~~this~~ phase of the work due to the low number and slow operating speeds of site vehicles (e.g., articulated trucks, excavator, dozer, etc.). Furthermore, the clay-till composition of the native soil materials found at the site tends to clod which inherently reduces windborne dust levels. The professional judgments of the site manager and the site health and safety officer dictated when air monitoring and conventional methods of dust suppression (e.g., water spraying) were used to control dust generated during construction.

Comment 2: Section 3.4.1, Pit Excavations, Page 3-4: The text states that, "Soil removal done to promote sidewall and slope stability resulted in the excavation of native soils from beyond the edge of the former burial pit debris cache;" however, Figure 3-9, does not indicate what the limits of excavation are or if they include the slope stabilization benching as was indicated by the original comment response. In addition, the figure does include a label for the "---" symbol. Revise this figure as was previously requested and committed to in the comment response in order to clarify the extent of the excavation, including any benching and to define all symbols used.

Response 2: Figure 3-9 will be revised to provide this information.

Comment 3: Appendix H: Section 3.1, Soil Data- Disposal Pit A/B, Page 4: This section states that remedial investigation (RI) sample data collected within the limits of the soil that was excavated during the removal action were "eliminated from the Pit A/B soil dataset" and replaced by analytical results from

confirmatory samples collected from excavations opened for Pit A and B and soil samples collected from the stockpile soils from each of the four disposal pit excavations. Upon review of Table I, however, it appears that soil sample data that were located within the excavation (ex. SB12-2, SB12-4, TP 12-1B) were used in the risk assessment dataset and not removed as per section 3.1. If an RI soil sample was removed from the area, the data associated with the sample is no longer part of the risk assessment data set. This discrepancy between the text and table applies to those samples in Table 1, Status of SEAD-12 RI Soil Samples Associated Previously Used for RI Risk Assessment, that are labeled as "within excavation" and the final deposition labeled "retained" and data status "used." Please clarify why data from samples located within the excavation were retained in the risk assessment as this labeling implies that these samples were within the excavation and were actually removed.

Response 3:

The dataset used in the Risk Assessment will be revised to remove all ESI and RI samples that are believed to have been removed during the disposal pit removal action. A summary of all the potential historic samples affected by the removal action will be provided to define why samples were retained or removed from risk assessment evaluation process.

Comment 4: Appendix H: Section 4.0 Hazard Identification, Page 4 through 6: Throughout this section, the results for the constituents of potential concern (COPC) selection process and the background comparison are not discussed. Instead, the text refers the reader to tables without any summary or conclusive statements in the text. This section should include some summary statements regarding the findings of the COPC selection process and the background analysis. Revise Section 4 to include summary or conclusive statements regarding the results for COPC selection process and the background comparison performed.

Response 4: The following text will be added to the risk assessment to address the COPC selection and evaluation process.

> All contaminants that were detected in soil samples that remained in the vicinity of one of the removal action excavation sites (e.g., post excavation confirmatory soil sample, ESI or RI sample not removed during the removal action, backfill soil characterization sample, etc.) were evaluated for inclusion in the updated human health risk assessment that was performed for the Disposal Pit A/B and C sites. Soil contaminants that were evaluated in this risk assessment (i.e., Contaminants of Potential Concern [COPCs]) were selected by comparing maximum detected concentrations (MDCs) left at an exposure point location (i.e., Disposal Pit A/B or C) with USEPA Regional Screening Level (RSLs) for residential soil. Comparator RSLs for carcinogenic compounds were used at full value, which corresponds to a target cancer risk of $1x10^{-6}$; comparator RSLs for non carcinogenic compounds were reduced by a factor of 10 (i.e., 0.1 times the listed RSL value), which corresponds to a hazard quotient of 0.1. Chemicals with concentrations below the comparator RSLs were eliminated from the list of COPCs evaluated in ~~this~~ the risk assessment. Chemicals with no available screening values and chemicals with maximum detected concentrations above the screening values were considered COPCs. In addition, all members of a chemical class that had any one member selected as a COPC were considered COPCs (e.g., all

detected carcinogenic polycyclic aromatic hydrocarbons ~~(~~[cPAHs]) were retained as COPCs if any one cPAH was identified as a COPC based on the aforementioned screening process).

Fifty-six (56) soil contaminants, including 10 VOCs, 20 SVOCs, five pesticide/PCBs and 22 metals were initially evaluated as potential COPCs for Disposal Pit A/B. The maximum concentration for each COPC was then compared to the appropriate residential soil RSL value (i.e., full value for carcinogenic compound or 0.1 time non-carcinogenic residential soil RSL value) and if the maximum concentration remaining at the site exceeded the RSL comparator value, the compound was retained for further evaluation during the risk assessment. Based on this determination, three cPAHs and seven metals were initially retained as COPCs, and due to the selection of three of the cPAHs, four other cPAHs that were also detected in the soil at Disposal Pit A/B, but which were not observed to exceed screening values, were also retained as "chemicals of the same group" for further evaluation in the risk assessment. In addition, three other SVOCs and two other metals were also retained for further evaluation under the risk assessment based on the determination that no comparator RSL screening value existed for them. The soil screening results for Disposal Pit A/B are summarized in **Attachment A Table 2**.

Data for the identified metal COPCs were then compared to SEDA background soil concentrations found for the same metals to assess whether there was any indication that the metals found at the disposal pit excavation site could be attributed to the release of material from activities historically conducted in the AOC, or could be associated with natural conditions. This comparison had been used and allowed during the risk assessment performed during the RI, and was repeated in the update to ensure that data considered in both risk assessments were equivalent. The comparison to background was performed using the Wilcoxon Mann-Whitney (WMW) Test

~~Soil screening tables summarizing the COPC identification process for soil are presented in:~~

- ~~Pit A/B: **Attachment A, Table 2**.~~
- ~~Pit C: **Attachment B, Table 2**.~~

~~Once screened, Disposal Pit soil data for metals were also compared to the SEDA background dataset using the Wilcoxon-Mann-Whitney (WMW) test~~ which is provided in the EPA's ProUCL Software package (version 4.00.04). This analysis procedure was used in place of the Wilcoxon Rank Sum test that was applied to the SEAD-12 datasets during the SEAD-12 RI.

The WMW ~~test~~ Test evaluate~~tests~~ whether measurements from one population tend to be larger or smaller than those found in the other population on the assumption that the dispersion of the two sample population distributions are roughly the same. The procedure determines which distribution is higher by comparing the relative ranks of the two datasets when the data from both sets are sorted and rank-ordered in a single list. The underlying assumption in the WMW Test is that any difference between background and site concentration distributions results due to a shift in the sample population's mean or median that is attributable to the presence of site-specific contamination adding to background levels.

The hypotheses used in the application of the WMW test are:

Ho (the null hypothesis):	The populations from which the two data sets have been drawn have the same mean.
Ha (the alternative): (hypothesis)	The measurements from the site population tend to exceed those from the background populations.

where Ho is assumed to be true unless the test indicates Ho should be rejected in favor of Ha. If Ho cannot be rejected, then it is accepted that the distribution of measurements in the background area is very similar in shape and central tendency (average) to the distribution of measurements in the area being investigated. The WRS Test does not require that either data set by normally distributed.

The results of the WMW Test for the nine metals retained after the comparison to RSL values are summarized in **Attachment A Table 3**. As is reflected in this table, the residual metal concentration statistic (i.e., Mean WMW Value) for six of the nine retained metals is lower than the comparable value reported sample concentrations in the SEDA background dataset. Therefore, the identified concentrations of these seven metals in the vicinity of Disposal Pit A/B can not be distinguished from background concentrations and there is no indication that a release has occurred at the site. The WMW analysis results for two other metals (i.e., selenium and thallium) indicate that levels of these two metals found in the vicinity of former Disposal Pit A/B are higher than those identified in the background soil so these two are retained for further analysis under the risk assessment. The WMW results for sodium provided conflicting information as the results indicate that all of the tested hypotheses (i.e., site equals background, site greater than or equal to background, site less than or equal to background) were true. However, since it is not mathematically possible for two datasets to be greater than and less than each other at the same time it is assumed that the sodium concentrations found at Disposal Pit A/B and the background are equal , and that no release of sodium is likely to have occurred at Disposal Pit A/B. Therefore, based on risk assessment pre-screening and background evaluations, 12 COPCs were evaluated for soil in the updated risk assessment for Disposal Pit A/B.

Fifty-eight (58) soil contaminants, including seven VOCs, 18 SVOCs, seven pesticides and 24 metals were initially evaluated as potential COPCs for Disposal Pit C. Again, the maximum concentration detected for each of the contaminants at Disposal Pit C was compared to the appropriate residential soil RSL value (i.e., full value or 0.1 time soil RSL value, as appropriate) and the compound was retained for further evaluation in the risk assessment if the maximum exceeded the screening value. Based on this determination, four cPAHs, one organochlorine pesticide and eight metals were retained as COPCs. Four other SVOCs, one organochlorine pesticide, and two metals were also retained for further evaluation based on the determination that no comparator RSL screening value existed for them. Due to the retention of the four cPAHs, the other three cPAHs were also retained as "chemicals of the same group", and one additional organochlorine pesticide was retained since it was an isomer of the two other organochlorine pesticides that were retained. The soil screening results for Disposal Pit C are summarized in **Attachment B Table 2**.

The results of the WMW Test for the ten metals retained after the comparison to RSL values are summarized in **Attachment B Table 3**. As is reflected in this table, the residual metal

concentration statistic (i.e., Mean WMW Value) for eight of the 10 retained metals is lower than the comparable value reported sample concentrations in the SEDA background dataset. Therefore, effects from these metals can not be distinguished from those of background conditions. Background data was not available for the remaining two metals (i.e., sodium and thallium) so these were retained for further processing in the risk assessment. Therefore, based on risk assessment pre-screening and background evaluations, 16 COPCs were evaluated for soil in the updated risk assessment for Disposal Pit C.

Comment 5: Appendix H: Section 1.0 Risk Characterization, Page 9 through 11: The cancer risks presented in the summary tables throughout this section are underestimated since they do not include the cancer risks associated with radionuclides. According to EPA guidance, OSWER Directive 9200.4-18, August 1997, *Establishment of Cleanup Levels for CERCLA Sites with Radioactive Contamination,* and EPA's 1989 Risk Assessment Guidance for Superfund, Part A, the risks need to be summed to provide an estimate of the combined risk presented by all carcinogenic contaminants. Revise Appendix H and Section 3.6 of the CCR to include radionuclide risks and sum these risks with the chemical risk to obtain a total site risk. Note that this applies to the pre-removal risk results as well.

Response 5: See response to General Comment 1 above.

Comment 6: Appendix H: Section 1.1 Risk Characterization Results, Page 9 through 11: Throughout the risk summaries for each area, the risk results are compared to EPA's risk management range of 1E-06 to 1E-04 and if the risks fall within this range, the risks are deemed "acceptable" however, carcinogenic risks falling within EPA's risk management range of 1E-06 to 1E-04 are not necessarily deemed acceptable. Only EPA can make determinations about whether incremental excess lifetime cancer risk or non carcinogenic hazard levels are appropriate. The risk summaries should be revised to remove the word "acceptable" and only compare risks to EPA's risk management range.

It is further noted that cancer risks increased for a number of exposure scenarios throughout this section and an explanation for this has not been provided. It is possible that the reduced data set (e.g., removal of excavated data points) may have affected the estimation of exposure point concentrations due to a reduced population of data. However, it is also possible that higher concentration data were evaluated in the HHRA since New York's SCOs were used to delineate excavations rather than the lower of SCOs or RSLs. The HHRA should include an uncertainty analysis to discuss and summarize the uncertainties inherent in each step of the HHRA process as well as uncertainties associated with the methodology of evaluating pre- and post-removal risks.

Response 6: The word "acceptable" will be removed from appropriate location within the risk assessment discussion.

The increased cancer risk noted for soil exposures result due to a difference in how the risk were computed for the various receptors between the risk determination presented in the RI Report and what has been presented in the Draft Final Construction Completion Report for SEAD-12. Risks computed in the RI for all receptors except the construction worker were based only on sample results that were collected from the top two feet of the soil at the sites. Samples included in the construction workers soil

exposure point concentration included samples that extended down to 15 feet below grade. For the risk assessment conducted at the conclusion of the Removal Action, soil point exposure concentrations for all receptors were derived from samples that were collected from the 0 to the deepest level of the excavation. This change in calculation approach was used because prior to the removal action there was a clear distinction between soil that was in the top two feet of the soil column versus what was present at deeper locations. Opening of the pits during the removal action, made all of the deeper soils accessible to all receptors at the time the Removal Action was completed.

The total depth soil exposure point concentrations used during the RI had higher concentrations than comparable exposure point concentrations reported for the 0 to 2 foot level during the RI. The RI total depth soil exposure point concentrations were also higher than total depth RA dataset soil point concentrations. However, the RA total depth soil exposure point concentrations were higher than the RI shallow soil point exposure point concentrations which results in the increases noted in the risk calculations.

Discussion of this effect will be added to the risk assessment discussion as it is updated to reflect changes in the datasets that result due to findings of Specific Comment 3 above.

Comment 7: Page 3-12, Paragraph 4: Provide Certificate of Compliance and HP Instrument QC Field Log. These documents are needed to assess the instrument performance.

Response 7: Field QC logs and calibration certificates for radiological instrumentation are located in Appendix D, Attachment C. Note: No measurements were documented using the Canberra Inspector 1000 portable MCA. The MCA was used as a quick isotope identifier while the project was awaiting sample analysis. Off site sample analysis was used to identify radionuclides of concern.

Comment 8: Page 3-14, Paragraph 5: Clarify that the systematic sampling points were selected for Class 1 survey units according to the MARSSIM guidelines. For Class 1 survey units MARSSIM recommends a systematic pattern installed on the survey unit.

Response 8: Class I survey unit sample points were selected as described in Section 3.6. Although not a grided pattern, the systematic sample points for radiological sampling were chosen to correspond with the chemical sample locations as the sampling frequency for the samples were similar. Grid squares were used to ensure proper sampling frequency. Sampling locations along the excavation perimeter were chosen per unit linear length rather than per unit area.

Comment 9: Page 3-15, Paragraph 5: Correct references to Appendices to reflect their actual locations. Raw analytical results were found in Appendix B of Appendix D of the Draft Final Report, not in the Appendix B of the Report. Chain of custody was found in Appendix E, not C.

Response 9:

Tabulations of final confirmatory sample radiological data reported by GEL are presented in Appendix B Tables B-1R and B-3R. The Cabrera Services Radiological Summary Report presented as Appendix D in the Draft Final Construction Completion Report will be revised to identify appendices to the Cabrera

Report as Attachments. Once this change is made, the Final Status Survey results will be located in Attachment B of Appendix D (i.e., Cabrera Services Summary Report).

Comment 10: Page 6-2, Paragraph 2: Specify radiological dose pathway scenario for which "10 millirems per year" are applied. Specific pathway scenario is not provided. "10 millirems per year" taken out of context of the specific scenario may mean different outcomes for the future site use.

Response 10: Specific pathway scenario for the 10 mrem per year limits was taken from the License Termination Plan (LTP), 2003, and was not independently developed for this project at SEAD-12. Wide Area DCGLs were also taken directly from the LTP. Resident Farmer was the scenario selected in the LTP for development of the DCGLs.

Comment 11: Page 6-2, Paragraph 2: Clarify what version of NUREG-1575 document was used as MARSSIM guidance for Final Status Survey. NUREG·1575 document has been revised since the revision referenced in the report.

Response 11: NUREG-1575, August, 2000 version is the correct reference.

APPENDIX D

Comment 1: Page 1-2, Paragraph 6; Page 1-3, Paragraph 2: Provide numerical value and explain the meaning, derivation, application and significance of the "worker DCGL". "Worker DCGL" is mentioned with no explanation provided.

Response 1: The inclusion of the word "worker" prior to DCGL was not intended to define a new or different DCGL, and will be removed from the report Final to avoid confusion.

Comment 2: Page 1-4, Paragraph 6; Page 3-1, Paragraph 4: Provide information on (i) what "critical group" was used in dose pathway analyses, (ii) in what scenario "10 mrem" limit was used and (iii) whether this limit was applied on annual basis. Information is needed to assess applicability of DCGLs.

Response 2: Specific pathway scenario for the 10 mrem per year limits was taken from the License Termination Plan (LTP), 2003, and was not independently developed for this project at SEAD-12. Wide Area DCGLs were also taken directly from the LTP. Resident Farmer was the scenario selected in the LTP for development of the DCGLs.

Comment 3: Page 2-3, Paragraph 2; Page 3-5, Paragraph 4: Provide Figures 2-1, 3-1. Provided Figure 2-1 does not display the content as referred to in text. Figure 3-1 is not provided in Appendix D.

Response 3: Figures 2-1 and 3-1 are located at the end of the Appendix D text, prior to the attachments and appear to correspond to the accompanying text.

Comment 4: Page 3-5, Paragraph 6: Provide sampling points on systematic grid as recommended by MARSSIM for Class 1 survey units. Sample points displayed in Figures 5-1 - 5-6 does not appear to be on a systematic triangular or quadratic grid.

Response 4: Class I survey unit sample points were selected as described in Section 3.6. Although not a grided pattern, the systematic sample points for radiological sampling were chosen to correspond with the chemical sample locations as the sampling frequency for the samples were similar. Grid squares were used to ensure proper sampling frequency. Sampling locations along the excavation perimeter were chosen per unit linear length rather than per unit area. Figures 7-1 through 7-7 show specific sample locations.

Comment 5: Page 3-24, Paragraph 1: Provide discussion on why results for Ra-226 in Table B-3R exceed DCGL. Section 1.4 states that Appendix B provides chemical and radiological confirmatory soil sample results. Seven out of ten sample results for Ra-226 concentration exceed DCGL of 1.7 pCi/g and the rest three exceed it if one sigma is added.

Response 5: In the Summary of Field Activities Technical Memorandum, Appendix D, Attachment D, section 3.1, analysis of Ra-226 is discussed. The project plan calls for utilizing the 609 keV Bi-214 gamma energy for quantifying Ra-226. The overburden samples results, however, were not reported in this manner. The Bi-214 values in Table B-3R will be used for Ra-226 assuming equilibrium.

Note that the currently reported values for Ra-226 in Table B-3R also have errors associated with them of +/- 90% of the sample value. This is indicative of the problem with directly quantifying Ra-226 via gamma spectroscopy. Using the Bi-214 with an equilibrium assumption is a preferred method for quantifying Ra-226. Table B-3R failed to incorporate this process as Table B-1R did. Table B-3R will be corrected. All overburden samples are less than project DCGLs using this analysis method.

Comment 6: Page 7-2, Paragraph 3; Page 7-3, Paragraphs 1-3; Pages 3-24 - 3-25: Provide Figures 7-1 - 7. Figures are not provided in Appendix D.

Response 6: Figures 7-1 through 7-7 are located in Appendix D following the text, prior to the attachments.

Army Response to Comments to the Information Contained in the Table Titled "Responses to Oleg Povetko's Comments on RESRAD Input Parameters for SEAD-12 Risk Assessment" (File Titled "Responses to RESRAD Input Parameters Comment Matrix - SEAD 12_051911.xlsx" Received on 05/25/2011).

Prepared by Oleg Povetko on 06/09/2011

Army Response Issued: 07/18/2011

Table's General Comment #1.

The document titled "Draft Final Construction Completion Report for the Radiological Waste Burial Pits Site (SEAD-12), Seneca Army Depot Activity, Romulus, New York; Contract W912DY-08-D-0003, Delivery Order 0003W912DY-08-D-0003, Delivery Order 0003" dated June 21, 2010, specifies Institutional/Training land use for SEAD-12 area. According to the report, Seneca County Industrial Development Authority In 2005, the SCIDA revised the planned future use of Depot property by modifying portions of the original Conservation/Recreation parcels to include Institutional Training, Residential/Resort, Green Energy, Development Reserve, Training Area, and Utility uses. The planned future land use for SEAD-12 is currently designated as Institutional/Training as shown on Figure 1-2. Although not explicitly stated in the scenario description, it appears that Residential Receptor scenario assumes no consumption of on-site grown plants or vegetables and no any other on-site farming activities. If this is the case, explain (i) how these land use restrictions will be conveyed to future land owner(s) and/or leaser(s), (ii) what institutional controls must be put in place to maintain these land use restrictions, and (iii) how the deed restrictions will be maintained during future land transfers.

Response

The intake exposure pathways previously proposed for the RESRAD model were consistent with the pathways that were used in the original Risk Assessment that was prepared and had been accepted by the EPA at the time of the submittal of the Remedial Investigation Report (Parsons 2002). However, based on the EPA's current comments, the Army has modified the proposed RESRAD input parameters associated with the removal action to include the food ingestion pathways to which resident farmer may be exposed. Please see the revised RESRAD input parameter listing that is provided with this response. Also if there is any concern for these input parameters, please let us know immediately.

The Army assumes that the inclusion of the additional ingestion pathways within the RESRAD analysis renders the EPA's three follow-up questions about land use controls and process moot until the full results of the chemical and radiological risk assessment are summarized. . It is our plan to complete the revised risk assessment and move forward with the submittal of a revised Draft Final Proposed Plan and Draft Record of Decision for SEAD-12 (and SEAD-72) in which actions required are based on the finalized data.

CONTAMINATED ZONE PARAMETERS						
Area of contaminated zone	AREA	10,000	**2160** (Pit A/B) **8403** (Pit C)	m^2	Site-specific values were used.	Cabrera 2011
Thickness of contaminated zone	THICK0	2	**0.15** (Pit A/B) **0.15** (Pit C)	m	Site-specific average depth of contamination	Cabrera 2011
Length parallel to the aquifer	LCZPAQ	100	46.5 (Pit A/B) 92 (Pit C)	m	Square root of the area of contamination.	Calculated
Times for calculations	TI	1, 3, 10, 30, 100, 300, 1000	1, 3, 10, 30, 100, 300, 1000	yr	RESRAD defaults for calculation times.	ANL 1993
COVER AND CONTAMINATED ZONE HYDROLOGICAL DATA						
Cover depth	COVER	0	0	M	As a conservative approach, no cover depth was assumed.	ANL 1993 (Section 31)
Density of cover material	DENSCV	1.5	**N/A**	g/cm^3	Lack of cover depth precludes an assigned value for this parameter.	ANL 1993 (Section 2)
Cover erosion rate	VCV	0.001	**N/A**	m/yr	Lack of cover depth precludes an assigned value for this parameter.	ANL 1993 (Section 14)

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Density of contaminated zone	DENSCZ	1.5	**1.28**	g/cm^3	Site-specific value was chosen based on the average of silt loam and clay loam soil. (Table 2.1)	ANL 1993 (Section 2)
Contaminated zone erosion rate	VCZ	0.001	**0.0006** **0.00006**	m/yr	Resident (Assume 2% slope) All others	ANL 1993
Contaminated zone total porosity	TPCZ	0.4	**0.37**	Unitless	Site-specific value	ANL 1993 (Section 3) USAEHA 1984
Contaminated zone field capacity	FCCZ	0.2	**0.06**	Unitless	Site-specific value	Parsons Engineering Science 1996
Contaminated zone hydraulic conductivity	HCCZ	10	**29**	m/yr	Assumed to be a factor of 10 less than the site-specific saturated zone hydraulic conductivity of 290 m/yr of the *SEAD-12 RI Report* reference.	ANL 1993 (Section 5) Parsons Engineering Science 2002
Contaminated zone b parameter	BCZ	5.3	**7.75**	Unitless	The contaminated zone b parameter was selected from Table 13.1 of the reference for the silty clay loam.	ANL 1993 (Section 13)
Humidity in air	HUMID	8	**8**	g/m^3	RESRAD default used.	ANL 1993
Evapotranspiration coefficient	EVAPTR	0.5	**0.7**	Unitless	See calculation in footnote (1) below	Parsons Engineering Science 1996
Wind speed	WIND	2	**3**	m/sec	Estimated using wind rose for Syracuse, NY	Parsons Engineering Science 2002
Precipitation	PRECIP	1	**0.75**	m/yr	Site-specific value based on reported 36.1 inches per year	ANL 1993 (Section 9), Parsons Engineering Science 2002
Irrigation	RI	0.2	**0**	m/yr	No irrigation onsite.	Parsons Engineering Science 2002
Irrigation mode	IDITCH	Overhead	Overhead	Unitless	The "Overhead" and "Ditch" designations are independent of the depth of contaminated zone and have no significant impact on the RESRAD evaluation. The RESRAD default designation was selected.	ANL 1993
Runoff coefficient	RUNOFF	0.2	0.2	Unitless	The RESRAD default value was selected based on reference value for intermediate combinations of clay and loam.	ANL 1993 (Section 10)

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Watershed area for nearby stream or pond	WAREA	1.00E6	**13000000**	m^2	Site-specific value (Appendix E, Table 2 of the reference)	ANL 1993 (Section 17), Parsons Engineering Science 2002
Accuracy for water/soil computations	EPS	0.001	0.001	Unitless	RESRAD default used.	ANL 1993
SATURATED ZONE HYDROLOGICAL DATA						
Density of saturated zone	DENSAQ	1.5	1.5	g/cm^3	RESRAD default used.	ANL 1993 (Section 2)
Saturated zone total porosity	TPSZ	0.4	**0.37**	Unitless	Site specific value	ANL 1993 (Section 3) USAEHA 1984
Saturated zone effective porosity	EPSZ	0.2	**0.175**	Unitless	Calculated value	Parsons Engineering Science 1996
Saturated zone field capacity	FCSZ	0.2	0.2	Unitless	RESRAD default used.	ANL 1993
Saturated zone hydraulic conductivity	HCSZ	100	**290**	m/yr	Saturated zone hydraulic conductivity for clay was based on a geometric mean hydraulic conductivity of 9.22×10^{-4} identified on Page 3-19 of the reference.	Parsons Engineering Science 2002
Saturated zone hydraulic gradient	HGWT	0.02	**0.011**	Unitless	Based on the average of the northern and southern values reported on page 3-19 of the reference.	Parsons Engineering Science 2002
Saturated zone b parameter	BSZ	5.3	5.3	Unitless	RESRAD default used.	ANL 1993 (Section 13)
Water table drop rate	VWT	0.001	**0**	m/yr	Assumption	ANL 1993 (Section 18)
Well pump intake depth (meters below water table)	DWIBWT	10	**3**	M	Site specific value	Parsons Engineering Science 2002
Model for Water Transport Parameters [Non-dispersion (ND) or Mass-Balance (MB)]	MODEL	ND	ND	unitless	RESRAD default used.	ANL 1993

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Well pumping rate	UW	250	**50**	m^3/yr	Based on field experience, 100 ml/min is a sustainable rate for extraction of groundwater from upper aquifer during well purging in preparation for groundwater sampling (as reported in Appendix E, Table 1 of the reference)	Parsons Engineering Science 2002
UNCONTAMINATED UNSATURATED ZONE PARAMETERS						
Number of unsaturated zone strata	NS	1	1	unitless	RESRAD default used.	ANL 1993 (Section 25)
Unsaturated zone thickness	H(1)	4	**1**	m	Site-specific measurement.	
Unsaturated zone soil density	DENSUZ(1)	1.5	1.5	g/cm^3	RESRAD default used.	ANL 1993 (Section 2)
Unsaturated zone total porosity	TPUZ(1)	0.4	**0.37**	unitless	Site specific value	ANL 1993 (Section 3), USAEHA 1984
Unsaturated zone effective porosity	EPSZ(1)	0.2	**0.175**	unitless	Calculated value	Parsons Engineering Science 1996
Unsaturated zone field capacity	FCSZ(1)	0.2	0.2	unitless	RESRAD default used.	ANL 1993
Unsaturated zone hydraulic conductivity	HCSZ(1)	10	**29**	m/yr	Assumed to be a factor of 10 less than the site-specific saturated zone hydraulic conductivity of 290 m/yr of the reference.	Parsons Engineering Science 2002
Unsaturated zone b parameter	BSZ	5.3	**7.75**	unitless	The assigned value was taken from Page 3-41 of the reference.	Parsons Engineering Science 2002
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: ACTINIUM						
Contaminated zone	DCNUCC(2 & 3)	20	2,400	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(2 & 3,1)	20	2,400	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(2 & 3)	20	2,400	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: COBALT						
Contaminated zone	DCNUCC(1)	1,000	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Unsaturated zone	DCNUCU(1,1)	1,000	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	1,000	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: CESIUM						
Contaminated zone	DCNUCC(1)	1,900	**1,900**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	1,900	**1,900**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	1,900	**1,900**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: RADIUM						
Contaminated zone	DCNUCC(1)	70	**9,100**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	70	**9,100**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	70	**9,100**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: LEAD						
Contaminated zone	DCNUCC(1)	100	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	100	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	100	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: TRITIUM						
Contaminated zone	DCNUCC(1)	0	**0.06**	cm^3/g	This assigned value was selected from Table 3.9.1 of the reference.	NRC 2000
Unsaturated zone	DCNUCU(1,1)	0	**0.06**	cm^3/g	This assigned value was selected from Table 3.9.1 of the reference.	NRC 2000

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Saturated zone	DCNUCS(1)	0	**0.06**	cm^3/g	This assigned value was selected from Table 3.9.1 of the reference.	NRC 2000
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: THORIUM						
Contaminated zone	DCNUCC(1)	60000	**5,800**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	60000	**5,800**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	60000	**5,800**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
OCCUPANCY, INHALATION AND EXTERNAL GAMMA DATA						
Inhalation rate	INHALR	8,400	**6,475** **10,512** **8,760** **11,000**	m^3/y	Residential (See calculation in footnote [2] below) Site Worker (1.2 m^3/hr) (Moderate Activity) Recreational Worker (1 m^3/hr) (Light Activity) Construction Worker (Upper bound of heavy outdoor activity)	USEPA 1997 USDOE 1993
Mass loading for inhalation	MLINH	0.0001	**7.58E-07** **6.0E-04**	g/m^3	Non-construction (Based on 1/Particulate Emission Factor. Default value for PEF = 1.32 x 109 m3/kg). Construction Worker	USEPA, 1996 ANL 1993 (Section 35)
Exposure duration	ED	30	**30** **25** **25** **1**	yr	Residential Site Worker Recreational Worker Construction Worker	USEPA 1991b
Inhalation shielding factor	SHF3	0.4	0.4	unitless	RESRAD default used.	ANL 1993 (Section 36)
External gamma shielding factor	SHF1	0.7	**0.4**	unitless	60% shielding per EPA, cited reference used for all indoor receptors.	USEPA, 2000
Indoor time fraction	FIND	0.5	**0.655** **0** **0** **0**	unitless	Residential (16.4 hours per day for 350 days/yr) Site Worker Recreational Worker Construction Worker	USEPA 1997 USEPA 1991b
Outdoor time fraction	FOTD	0.25	**0.08** **0.0183** **0.16** **0.228**	unitless	Residential (2 hours per day for 350 days/yr) Site Worker (8 hrs/day for 20 days/yr) Recreational Worker (8 hrs/day for 175 days/yr) Construction Worker (8 hrs/day for 250 days/hr)	USEPA 1991b

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Shape of the contaminated zone (circular or non-circular)	FS	Circular	Circular	unitless	RESRAD default used.	ANL 1993 (Section 50)
INGESTION PATHWAY (DIETARY DATA)						
Fruits, vegetables and grain consumption	DIET(1)	160	**42.7**	kg/yr	Part 2, Equation 5	USEPA 2000
Leafy vegetable consumption	DIET(2)	14	**4.66**	kg/yr	Part 2, Equation 5	USEPA 2000
Milk consumption	DIET(3)	92	**135.4**	L/yr	Based on the consumption of milk by a 12-19 year old male and is presented in Table 11-15 of the reference	USEPA 1997
Meat and poultry consumption	DIET(4)	63	**46.02**	kg/yr	EPA recommends that per capital average meat consumption rate is 2.1 g/kg-day or 46.02 kg /yr (= 2.1 g/kg-day * 60 kg *365.25 days/yr* 1E-3 kg/g)	USEPA 1997
Fish consumption	DIET(5)	5.4	**7.34**	kg/yr	EPA recommends that per capital average total fish consumption rate is 20.1 g/day or 7.34 kg /yr (= 20.1 g/day * 365.25 days/yr* 1E-3 kg/g)	USEPA 1997
Other seafood consumption	DIET(6)	0.9	0.9	kg/yr	RESRAD default used.	ANL 1993
Soil ingestion rate	SOIL	36.5	**43.8** **36.5** **36.5** **175.2**	g/yr	Residential (See calculation in footnote [3] below) Site Worker = (100 mg/day * 365 days/yr * 1E-3 g/mg) Recreational Worker= (100 mg/day * 365 days/yr * 1E-3 g/mg) Construction Worker = (480 mg/day * 365 days/yr * 1E-3 g/mg)	USEPA 1991b
Drinking water intake	DW1	510	510	L/yr	RESRAD default used.	ANL 1993
Contamination fraction of drinking water	FDW	1	1	unitless	RESRAD default used.	ANL 1993
Contamination fraction of household water	FHHW	1	N/A	unitless	Radon pathway is not selected; hence this parameter is not applicable	ANL 1993
Contamination fraction of livestock water	FLW	1	1	unitless	Pathway active only for residential receptor	ANL 1993
Contamination fraction of irrigation water	FIRW	1	1	unitless	Pathway active only for residential receptor	ANL 1993
Contamination fraction of aquatic food	FR9	0.5	0.5	unitless	RESRAD default used.	ANL 1993
Contaminated fraction of plant food	FPLANT	-1	-1	unitless	RESRAD default used.	ANL 1993
Contaminated fraction of meat	FMEAT	-1	-1	unitless	RESRAD default used.	ANL 1993
Contaminated fraction of milk	FMILK	-1	-1	unitless	RESRAD default used.	ANL 1993
INGESTION PATHWAY (NON-DIETARY DATA)						
Livestock fodder intake for meat	LP15	68	68	kg/day	RESRAD default used.	ANL 1993

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Livestock fodder intake for milk	LP16	55	55	kg/day	RESRAD default used.	ANL 1993
Livestock water intake for meat	LW15	50	50	L/day	RESRAD default used.	ANL 1993
Livestock water intake for milk	LW15	160	160	L/day	RESRAD default used.	ANL 1993
Livestock intake of soil	LS1	0.5	0.5	kg/day	RESRAD default used.	ANL 1993
Mass loading for foliar deposition	MLFD	0.0001	0.0001	g/m^3	RESRAD default used.	ANL 1993
Depth of soil mixing layer	DM	0.15	0.15	m	RESRAD default used.	ANL 1993 (Section 35)
Depth of roots	DROOT	0.9	0.9	m	RESRAD default used.	ANL 1993
Groundwater fractional usage: Drinking water	FGWDW	1	1	unitless	RESRAD default used.	ANL 1993
Groundwater fractional usage: Household water	FGWHH	1	1	unitless	RESRAD default used.	ANL 1993
Groundwater fractional usage: Livestock water	FGWLW	1	1	unitless	RESRAD default used.	ANL 1993
Groundwater fractional usage: Irrigation water	FGWIR	1	1	unitless	RESRAD default used.	ANL 1993
PLANT TRANSPORT FACTORS						
Wet weight crop yield: non-leafy vegetables	YV(1)	0.7	0.7	kg/m^2	RESRAD default used.	ANL 1993
Wet weight crop yield: leafy vegetables	YV(2)	1.5	1.5	kg/m^2	RESRAD default used.	ANL 1993
Wet weight crop yield: fodder	YV(3)	1.1	1.1	kg/m^2	RESRAD default used.	ANL 1993
Length of growing season: non-leafy vegetables	TE(1)	0.17	0.17	years	RESRAD default used.	ANL 1993
Length of growing season: leafy vegetables	TE(2)	0.25	0.25	years	RESRAD default used.	ANL 1993
Length of growing season: fodder	TE(3)	0.08	0.08	years	RESRAD default used.	ANL 1993
Translocation factor: non-leafy vegetables	TIV(1)	0.1	0.1	unitless	RESRAD default used.	ANL 1993
Translocation factor: leafy vegetables	TIV(2)	1	1	unitless	RESRAD default used.	ANL 1993
Translocation factor: fodder	TIV(3)	1	1	unitless	RESRAD default used.	ANL 1993

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Weathering removal constant	WLAM	20	20	y^{-1}	RESRAD default used.	ANL 1993
Wet foliar interception fraction: non-leafy vegetables	RWET(1)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Wet foliar interception fraction: leafy vegetables	RWET(2)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Wet foliar interception fraction: fodder	RWET(3)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Dry foliar interception fraction: non-leafy vegetables	RDRY(1)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Dry foliar interception fraction: leafy vegetables	RDRY(2)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Dry foliar interception fraction: fodder	RDRY(3)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
STORAGE TIMES BEFORE USE						
Fruits, non-leafy vegetables and grain	STOR_T(1)	14	14	days	RESRAD default used.	ANL 1993
Leafy vegetables	STOR_T(2)	1	1	days	RESRAD default used.	ANL 1993
Milk	STOR_T(3)	1	1	days	RESRAD default used.	ANL 1993
Meat	STOR_T(4)	20	20	days	RESRAD default used.	ANL 1993
Fish	STOR_T(5)	7	7	days	RESRAD default used.	ANL 1993
Crustacea and mollusks	STOR_T(6)	7	7	days	RESRAD default used.	ANL 1993
Well water	STOR_T(7)	1	1	days	RESRAD default used.	ANL 1993
Surface water	STOR_T(8)	1	1	days	RESRAD default used.	ANL 1993
Livestock fodder	STOR_T(9)	45	45	days	RESRAD default used.	ANL 1993

Footnote

N/A Not Applicable

(1) Calculation of Evapotranspiration Coefficient, RESRAD Manual, Version 5, page 198, with following parameters from Parsons Engineering Science, Final Groundwater Modeling Report at the Ash Landfill Site, June 1996.
I = Infiltration Rate, m/yr (7 in/year = 0.18 m/yr)
Ce = Evapotranspiration Coefficient
Cr = runoff coefficient (0.2)
Pr = Precipitation rate, annual rainfall, m/yr (0.75 m/yr)
Irr = Irrigation rate (0 m/yr)

(2) Time-weighted Inhalation Rate for Residential Receptor = (7300 m^3/yr x 24 yrs + 3175.5 m^3/yr x 6 yrs) / (24 yrs + 6 yrs) = 6575 m^3/yr

(3) Time-weighted Soil Ingestion Rate for Residential Receptor = (0.1 g/day x 365 days/yr x 24 yrs + 0.2 g/day x 365days/yr x 6 yrs) / (24 yrs + 6 yrs) = 43.8 g/yr

External Gamma	N/A	Active	Active	N/A	RESRAD default used.	Parsons Engineering Science 2002
Inhalation (without radon)	N/A	Active	Active	N/A	RESRAD default used.	Parsons Engineering Science 2002
Plant Ingestion	N/A	Active	Inactive	N/A	Only active for Residential Farmer scenario	Parsons Engineering Science 2002
Meat Ingestion	N/A	Active	Inactive	N/A	Only active for Residential Farmer scenario	Parsons Engineering Science 2002
Milk Ingestion	N/A	Active	Inactive	N/A	Only active for Residential Farmer scenario	Parsons Engineering Science 2002
Aquatic Foods	N/A	Active	Inactive	N/A	Only active for Residential Farmer scenario	Parsons Engineering Science 2002
Drinking Water	N/A	Active	Inactive	N/A	Active for Future Park Worker, Recreation Receptor and Residential Farmer Scenario	Parsons Engineering Science 2002
Soil Ingestion	N/A	Active	Active	N/A	RESRAD default used.	Parsons Engineering Science 2002
Radon	N/A	Inactive	Inactive	N/A	Not applicable per cited reference.	NRC, 1994
CONTAMINATED ZONE PARAMETERS						
Area of contaminated zone	AREA	10,000	**2160** (Pit A/B) **8403** (Pit C)	m^2	Site-specific values were used.	Cabrera 2011
Thickness of contaminated zone	THICK0	2	**0.15** (Pit A/B) **0.15** (Pit C)	m	Site-specific average depth of contamination	Cabrera 2011
Length parallel to the aquifer	LCZPAQ	100	46.5 (Pit A/B) 92 (Pit C)	m	Square root of the area of contamination.	Calculated
Times for calculations	TI	1, 3, 10, 30, 100, 300, 1000	1, 3, 10, 30, 100, 300, 1000	yr	RESRAD defaults for calculation times.	ANL 1993
COVER AND CONTAMINATED ZONE HYDROLOGICAL DATA						
Cover depth	COVER	0	0	M	As a conservative approach, no cover depth was assumed.	ANL 1993 (Section 31)
Density of cover material	DENSCV	1.5	**N/A**	g/cm^3	Lack of cover depth precludes an assigned value for this parameter.	ANL 1993 (Section 2)
Cover erosion rate	VCV	0.001	**N/A**	m/yr	Lack of cover depth precludes an assigned value for this parameter.	ANL 1993 (Section 14)

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Density of contaminated zone	DENSCZ	1.5	**1.28**	g/cm^3	Site-specific value was chosen based on the average of silt loam and clay loam soil. (Table 2.1)	ANL 1993 (Section 2)
Contaminated zone erosion rate	VCZ	0.001	**0.0006** **0.00006**	m/yr	Resident (Assume 2% slope) All others	ANL 1993
Contaminated zone total porosity	TPCZ	0.4	**0.37**	Unitless	Site-specific value	ANL 1993 (Section 3) USAEHA 1984
Contaminated zone field capacity	FCCZ	0.2	**0.06**	Unitless	Site-specific value	Parsons Engineering Science 1996
Contaminated zone hydraulic conductivity	HCCZ	10	**29**	m/yr	Assumed to be a factor of 10 less than the site-specific saturated zone hydraulic conductivity of 290 m/yr of the *SEAD-12 RI Report* reference.	ANL 1993 (Section 5) Parsons Engineering Science 2002
Contaminated zone b parameter	BCZ	5.3	**7.75**	Unitless	The contaminated zone b parameter was selected from Table 13.1 of the reference for the silty clay loam.	ANL 1993 (Section 13)
Humidity in air	HUMID	8	**6.6**	g/m^3	Site-specific value	Parsons Engineering Science 2002
Evapotranspiration coefficient	EVAPTR	0.5	**0.7**	Unitless	See calculation in footnote (1) below	Parsons Engineering Science 1996
Wind speed	WIND	2	**3**	m/sec	Estimated using wind rose for Syracuse, NY	Parsons Engineering Science 2002
Precipitation	PRECIP	1	**0.75**	m/yr	Site-specific value based on reported 36.1 inches per year	ANL 1993 (Section 9), Parsons Engineering Science 2002
Irrigation	RI	0.2	**0**	m/yr	No irrigation onsite.	Parsons Engineering Science 2002
Irrigation mode	IDITCH	Overhead	Overhead	Unitless	The "Overhead" and "Ditch" designations are independent of the depth of contaminated zone and have no significant impact on the RESRAD evaluation. The RESRAD default designation was selected.	ANL 1993
Runoff coefficient	RUNOFF	0.2	0.2	Unitless	The RESRAD default value was selected based on reference value for intermediate combinations of clay and loam.	ANL 1993 (Section 10)

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Watershed area for nearby stream or pond	WAREA	1.00E6	**13000000**	m^2	Site-specific value (Appendix E, Table 2 of the reference)	ANL 1993 (Section 17), Parsons Engineering Science 2002
Accuracy for water/soil computations	EPS	0.001	0.001	Unitless	RESRAD default used.	ANL 1993
SATURATED ZONE HYDROLOGICAL DATA						
Density of saturated zone	DENSAQ	1.5	1.5	g/cm^3	RESRAD default used.	ANL 1993 (Section 2)
Saturated zone total porosity	TPSZ	0.4	**0.37**	Unitless	Site specific value	ANL 1993 (Section 3) USAEHA 1984
Saturated zone effective porosity	EPSZ	0.2	**0.175**	Unitless	Calculated value	Parsons Engineering Science 1996
Saturated zone field capacity	FCSZ	0.2	0.2	Unitless	RESRAD default used.	ANL 1993
Saturated zone hydraulic conductivity	HCSZ	100	**290**	m/yr	Saturated zone hydraulic conductivity for clay was based on a geometric mean hydraulic conductivity of 9.22×10^{-4} identified on Page 3-19 of the reference.	Parsons Engineering Science 2002
Saturated zone hydraulic gradient	HGWT	0.02	**0.011**	Unitless	Based on the average of the northern and southern values reported on page 3-19 of the reference.	Parsons Engineering Science 2002
Saturated zone b parameter	BSZ	5.3	5.3	Unitless	RESRAD default used.	ANL 1993 (Section 13)
Water table drop rate	VWT	0.001	**0**	m/yr	Assumption	ANL 1993 (Section 18)
Well pump intake depth (meters below water table)	DWIBWT	10	**3**	M	Site specific value	Parsons Engineering Science 2002
Model for Water Transport Parameters [Non-dispersion (ND) or Mass-Balance (MB)]	MODEL	ND	ND	unitless	RESRAD default used.	ANL 1993

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Well pumping rate	UW	250	**50**	m^3/yr	Based on field experience, 100 ml/min is a sustainable rate for extraction of groundwater from upper aquifer during well purging in preparation for groundwater sampling (as reported in Appendix E, Table 1 of the reference)	Parsons Engineering Science 2002
UNCONTAMINATED UNSATURATED ZONE PARAMETERS						
Number of unsaturated zone strata	NS	1	1	unitless	RESRAD default used.	ANL 1993 (Section 25)
Unsaturated zone thickness	H(1)	4	**1**	m	Site-specific measurement.	
Unsaturated zone soil density	DENSUZ(1)	1.5	1.5	g/cm^3	RESRAD default used.	ANL 1993 (Section 2)
Unsaturated zone total porosity	TPUZ(1)	0.4	**0.37**	unitless	Site specific value	ANL 1993 (Section 3), USAEHA 1984
Unsaturated zone effective porosity	EPSZ(1)	0.2	**0.175**	unitless	Calculated value	Parsons Engineering Science 1996
Unsaturated zone field capacity	FCSZ(1)	0.2	0.2	unitless	RESRAD default used.	ANL 1993
Unsaturated zone hydraulic conductivity	HCSZ(1)	10	**29**	m/yr	Assumed to be a factor of 10 less than the site-specific saturated zone hydraulic conductivity of 290 m/yr of the reference.	Parsons Engineering Science 2002
Unsaturated zone b parameter	BSZ	5.3	**7.75**	unitless	The assigned value was taken from Page 3-41 of the reference.	Parsons Engineering Science 2002
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: ACTINIUM						
Contaminated zone	DCNUCC(2 & 3)	20	2,400	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(2 & 3,1)	20	2,400	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(2 & 3)	20	2,400	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: COBALT						
Contaminated zone	DCNUCC(1)	1,000	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Unsaturated zone	DCNUCU(1,1)	1,000	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	1,000	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: CESIUM						
Contaminated zone	DCNUCC(1)	1,900	**1,900**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	1,900	**1,900**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	1,900	**1,900**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: RADIUM						
Contaminated zone	DCNUCC(1)	70	**9,100**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	70	**9,100**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	70	**9,100**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: LEAD						
Contaminated zone	DCNUCC(1)	100	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	100	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	100	**550**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: TRITIUM						
Contaminated zone	DCNUCC(1)	0	**0.06**	cm^3/g	This assigned value was selected from Table 3.9.1 of the reference.	NRC 2000
Unsaturated zone	DCNUCU(1,1)	0	**0.06**	cm^3/g	This assigned value was selected from Table 3.9.1 of the reference.	NRC 2000

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Saturated zone	DCNUCS(1)	0	**0.06**	cm^3/g	This assigned value was selected from Table 3.9.1 of the reference.	NRC 2000
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: THORIUM						
Contaminated zone	DCNUCC(1)	60000	**5,800**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	60000	**5,800**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	60000	**5,800**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
ELEMENTAL DISTRIBUTION (PARTITION) COEFFICIENTS AND LEACH RATES: URANIUM						
Contaminated zone	DCNUCC(1)	50	**1,600**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Unsaturated zone	DCNUCU(1,1)	50	**1,600**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
Saturated zone	DCNUCS(1)	50	**1,600**	cm^3/g	This assigned value was selected from Table 32.1 of the reference for the clay.	ANL 1993
OCCUPANCY, INHALATION AND EXTERNAL GAMMA DATA						
Inhalation rate	INHALR	8,400	**5,277** **10,512** **8,760** **11,000** **3175.5**	m^3/y	Residential (See calculation in footnote [2] below) Site Worker (1.2 m^3/hr) (Moderate Activity) Future Park Worker (1 m^3/hr) (Light Activity) Construction Worker (Upper bound of heavy outdoor activity) Recreation Receptor (Child) (8.7 m^3/day)	USEPA 1997 USDOE 1993 USEPA 1997
Mass loading for inhalation	MLINH	0.0001	**7.58E-07** **6.0E-04**	g/m^3	Non-construction (Based on 1/Particulate Emission Factor. Default value for PEF = 1.32 x 109 m3/kg). Construction Worker	USEPA, 1996 ANL 1993 (Section 35)
Exposure duration	ED	30	**30** **25** **25** **1** **5**	yr	Residential Site Worker Park Worker Construction Worker Recreational Receptor	USEPA 1991b
Inhalation shielding factor	SHF3	0.4	0.4	unitless	RESRAD default used.	ANL 1993 (Section 36)

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
External gamma shielding factor	SHF1	0.7	**0.4**	unitless	60% shielding per EPA, cited reference used for all indoor receptors.	USEPA, 2000
Indoor time fraction	FIND	0.5	**0.655** **0** **0** **0** **0**	unitless	Residential (16.4 hours per day for 350 days/yr) Site Worker Park Worker Construction Worker Recreational Receptor	USEPA 1997 USEPA 1991b
Outdoor time fraction	FOTD	0.25	**0.08** **0.0183** **0.16** **0.228** **0.0384**	unitless	Residential (2 hours per day for 350 days/yr) Site Worker (8 hrs/day for 20 days/yr) Park Worker (8 hrs/day for 175 days/yr) Construction Worker (8 hrs/day for 250 days/hr) Recreational Receptor (24 hours for 14 days)	USEPA 1991b
Shape of the contaminated zone (circular or non-circular)	FS	Circular	Circular	unitless	RESRAD default used.	ANL 1993 (Section 50)
INGESTION PATHWAY (DIETARY DATA)						
Fruits, vegetables and grain consumption	DIET(1)	160	**147.9**	kg/yr	Residential (See calculation in footnote [3] below)	USEPA 2011
Leafy vegetable consumption	DIET(2)	14	**9.2**	kg/yr	Residential (See calculation in footnote [4] below)	USEPA 2011
Milk consumption	DIET(3)	92	**116.4**	L/yr	Residential (See calculation in footnote [5] below)	USEPA 2011
Meat and poultry consumption	DIET(4)	63	**46**	kg/yr	Residential (See calculation in footnote [6] below)	USEPA 2011
Fish consumption	DIET(5)	5.4	**5.3**	kg/yr	Residential (See calculation in footnote [7] below)	USEPA 2011
Other seafood consumption	DIET(6)	0.9	0.9	kg/yr	RESRAD default used.	ANL 1993
Soil ingestion rate	SOIL	36.5	**43.8** **36.5** **36.5** **175.2** **73**	g/yr	Residential (See calculation in footnote [8] below) Site Worker = (100 mg/day * 365 days/yr * 1E-3 g/mg) Park Worker= (100 mg/day * 365 days/yr * 1E-3 g/mg) Construction Worker = (480 mg/day * 365 days/yr * 1E-3 g/mg) Recreational Receptor = (200 mg/day * 365 days/yr)	USEPA 1991b
Drinking water intake	DW1	510	510	L/yr	RESRAD default used.	ANL 1993
Contamination fraction of drinking water	FDW	1	1	unitless	RESRAD default used.	ANL 1993
Contamination fraction of household water	FHHW	1	N/A	unitless	Radon pathway is not selected; hence this parameter is not applicable	ANL 1993
Contamination fraction of livestock water	FLW	1	1	unitless	Pathway active only for residential receptor	ANL 1993
Contamination fraction of irrigation water	FIRW	1	1	unitless	Pathway active only for residential receptor	ANL 1993
Contamination fraction of aquatic food	FR9	0.5	0.5	unitless	RESRAD default used.	ANL 1993

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
Contaminated fraction of plant food	FPLANT	-1	-1	unitless	RESRAD default used.	ANL 1993
Contaminated fraction of meat	FMEAT	-1	-1	unitless	RESRAD default used.	ANL 1993
Contaminated fraction of milk	FMILK	-1	-1	unitless	RESRAD default used.	ANL 1993
INGESTION PATHWAY (NON-DIETARY DATA)						
Livestock fodder intake for meat	LP15	68	68	kg/day	RESRAD default used.	ANL 1993
Livestock fodder intake for milk	LP16	55	55	kg/day	RESRAD default used.	ANL 1993
Livestock water intake for meat	LW15	50	50	L/day	RESRAD default used.	ANL 1993
Livestock water intake for milk	LW15	160	160	L/day	RESRAD default used.	ANL 1993
Livestock intake of soil	LS1	0.5	0.5	kg/day	RESRAD default used.	ANL 1993
Mass loading for foliar deposition	MLFD	0.0001	0.0001	g/m^3	RESRAD default used.	ANL 1993
Depth of soil mixing layer	DM	0.15	0.15	m	RESRAD default used.	ANL 1993 (Section 35)
Depth of roots	DROOT	0.9	0.9	m	RESRAD default used.	ANL 1993
Groundwater fractional usage: Drinking water	FGWDW	1	1	unitless	RESRAD default used.	ANL 1993
Groundwater fractional usage: Household water	FGWHH	1	1	unitless	RESRAD default used.	ANL 1993
Groundwater fractional usage: Livestock water	FGWLW	1	1	unitless	RESRAD default used.	ANL 1993
Groundwater fractional usage: Irrigation water	FGWIR	1	1	unitless	RESRAD default used.	ANL 1993
PLANT TRANSPORT FACTORS						
Wet weight crop yield: non-leafy vegetables	YV(1)	0.7	0.7	kg/m^2	RESRAD default used.	ANL 1993
Wet weight crop yield: leafy vegetables	YV(2)	1.5	1.5	kg/m^2	RESRAD default used.	ANL 1993
Wet weight crop yield: fodder	YV(3)	1.1	1.1	kg/m^2	RESRAD default used.	ANL 1993
Length of growing season: non-leafy	TE(1)	0.17	0.17	years	RESRAD default used.	ANL 1993

DEFAULT AND RECOMMENDED VALUES FOR RESRAD INPUT PARAMETERS

RESRAD Version 6.5					Parameter Justification	
Parameter	**Code**	**Default Value**	**User Input Value**	**Units**	**Comments**	**Reference**
vegetables						
Length of growing season: leafy vegetables	TE(2)	0.25	0.25	years	RESRAD default used.	ANL 1993
Length of growing season: fodder	TE(3)	0.08	0.08	years	RESRAD default used.	ANL 1993
Translocation factor: non-leafy vegetables	TIV(1)	0.1	0.1	unitless	RESRAD default used.	ANL 1993
Translocation factor: leafy vegetables	TIV(2)	1	1	unitless	RESRAD default used.	ANL 1993
Translocation factor: fodder	TIV(3)	1	1	unitless	RESRAD default used.	ANL 1993
Weathering removal constant	WLAM	20	20	y^{-1}	RESRAD default used.	ANL 1993
Wet foliar interception fraction: non-leafy vegetables	RWET(1)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Wet foliar interception fraction: leafy vegetables	RWET(2)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Wet foliar interception fraction: fodder	RWET(3)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Dry foliar interception fraction: non-leafy vegetables	RDRY(1)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Dry foliar interception fraction: leafy vegetables	RDRY(2)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
Dry foliar interception fraction: fodder	RDRY(3)	0.25	0.25	unitless	RESRAD default used.	ANL 1993
STORAGE TIMES BEFORE USE						
Fruits, non-leafy vegetables and grain	STOR_T(1)	14	14	days	RESRAD default used.	ANL 1993
Leafy vegetables	STOR_T(2)	1	1	days	RESRAD default used.	ANL 1993
Milk	STOR_T(3)	1	1	days	RESRAD default used.	ANL 1993
Meat	STOR_T(4)	20	20	days	RESRAD default used.	ANL 1993
Fish	STOR_T(5)	7	7	days	RESRAD default used.	ANL 1993
Crustacea and mollusks	STOR_T(6)	7	7	days	RESRAD default used.	ANL 1993
Well water	STOR_T(7)	1	1	days	RESRAD default used.	ANL 1993
Surface water	STOR_T(8)	1	1	days	RESRAD default used.	ANL 1993
Livestock fodder	STOR_T(9)	45	45	days	RESRAD default used.	ANL 1993

Footnotes

N/A Not Applicable

(1) **Calculation of Evapotranspiration Coefficient**, RESRAD Manual, Version 5, page 198, with following parameters from Parsons Engineering Science, Final Groundwater Modeling Report at the Ash Landfill Site, June 1996.
I = Infiltration Rate, m/yr (7 in/year = 0.18 m/yr)
Ce = Evapotranspiration Coefficient
Cr = runoff coefficient (0.2)
Pr = Precipitation rate, annual rainfall, m/yr (0.75 m/yr)
Irr = Irrigation rate (0 m/yr)

(2) Determination of Inhalation Rate for the Residential Receptors

Inhalation Rate for Child (0-1)

Age Group	Month	Mean Inhalation Rate (m^3/day)	References
0-1	1	3.6	**Mean value from Table 6-1 of EFH (USEPA, 2011)**
1-3	2	3.5	
4-6	3	4.1	
7-12	6	5.4	
Weighted Inhalation Rate for Child (0-1)		**4.61**	

Inhalation Rate for Child (0-6)

Age Group	Years	Rate (m^3/day)	References
0-1	1	4.61	**Mean value from Table 6-1 of EFH (USEPA, 2011)**
1-2	1	8	
2-3	1	8.9	
3-6	3	10.1	
Weighted Intake Rate for Child (0-6)		**8.64**	

Inhalation Rate for Adult

Age Group	Years	Rate (m^3/day)	References
18-21	3	16.3	**Mean Value from Table 6-1 of EFH (USEPA, 2011)**
21-31	10	15.7	
31-41	10	16	
41-42	1	16	
Weighted Intake Rate for Adult (18-42)		**15.91**	

Weighted Total Inhalation Rate

Receptor	Rate (m^3/day)	Intake Rate (m3/yr)	Exposure Duration (yr)
Child	8.64	3151.78	6
Adult	15.91	5808.06	24
Weighted Total Inhalation Rate (m^3/yr)[1]			**5276.8**

Footnote

[1] Weighted total inhalation rate = (3151.78*6 + 5808.06*24)/(24+6)

(3) Determination of Total Fruits, Vegetables and Grain Consumption Rate for Residential Receptor

Body Weight for Child (0-1)

Age Group	Month	Mean Weight (Kg)	References
0-1	1	4.8	**Mean value from Table ES-1 of EFH (USEPA, 2011)**
1-3	2	5.9	
3-6	3	7.4	
6-12	6	9.2	
Weighted Body Weight for Child (0-1)		**7.83**	

Consumption Rate for Child (0-6)

Age Group	Years	Fruit Intake (g/kg-day)	Vegetable Intake (g/kg-day)	Grain Intake (g/kg-day)	Total Intake Rate (g/kg-day)	Body Weight (kg)	Intake Rate (g/day)	References
0-1	1	6.2	5	3.1	14.3	7.83	112.0	**Mean Value from Table ES-1 of EFH (USEPA, 2011)**

(4) Determination of Total Leafy Vegetables Consumption Rate for Residential Receptor

Based on USDA report, *Food Consumption, Prices and Expenditures 1970-1997* (Putnam et al., 1999), fresh vegetables accounted for 44% of the total vegetables consumed during the 25-year period. The fraction of non-leafy fresh vegetables consumed from 1972 – 1997 was estimated at 0.67 of the total fresh vegetable consumption rate.

The above statistics were considered during the estimation of leafy vegetable consumption rate for residential receptor.

Army's Response to Comments from the United States Environmental Protection Agency

Subject: Review Comments on Radiological Portions
Final Construction Completion Report
Removal Action at the Radiological Waste Burial Pits (SEAD-12)
Seneca Army Depot
Romulus, New York

Comments Dated: March 1, 2012

Date of Comment Response: April 30, 2012

Army's Response to Comments

SPECIFIC COMMENTS

Comment 1: Appendix C, Page 1-3, Para 3. Basis: Pm-147 is not mentioned as a soil radionuclide which concentration exceeds background while Appendix D, Attachment C, Table C-2C shows that it is present in noticeable concentrations in onsite soil samples. No information of Pm-147 background level is provided.

Recommendation 1: Explain why Pm-147 is not mentioned in Para 3, provide discussion on presence of Pm-147 in soil samples. Provide information of Pm-147 background levels typical for the area.

Response 1: Pm-147 was not discussed in the text as the reported concentration was not likely representative of actual site conditions. The radionuclide is not typically found in background due to its short half-life. Pm-147 was used in military rocket sighting systems. According to Army records, there was only one structure, AO701, which is not located atSEAD-12, authorized to store systems with this sighting system. These weapon sights were not demilitarized or disposed of at SEAD-12; therefore, it is unlikely that there would have been exposure to Pm-147 at SEAD-12. Further, when the authorized structure was surveyed as part of the NRC License Termination Program, there was no evidence of a release[1]. The half-life of Pm-147 is 2.6 years and the concentration would not be present for a notable period of time. The weapons systems with this sighting system left the installation by 1995, making the presence of Pm-147 highly unlikely based on the half life.

In addition, the referenced Pm-147 concentration is presented in the Final SEAD-12 Remedial Investigation Report (RI) (Parsons, 2002). The Army believes that since Pm-147 was not identified in the waste pits during the removal, discussion is not warranted in the CCR and it is not relevant to removal action work or the CCR.

Comment 2: Table 3-3, Appendix D, Table 3-2, Tables D-1 through D-4, Table C-2C. Basis: It's not clear how radionuclide background concentrations were determined. For example, Tables 3-3 and Appendix D Table 3-2 lists 0.6 and 1.0 pCi/g as average SEAD-12 soil background concentrations for Ra-226 and Th-232, respectively, while Tables D-1 through D-4 show 16.29 and 1.13 pCi/g, respectively. Values in Table C-2C differ from Table 3-2 also. It's not clear how Ra-228 background concentration was determined and whether the most reasonably conservative value was used for EPC determination.

[1] Parsons, *NRC License Termination Report, Seneca Army Depot Activity*, June 2004.

Recommendation 2: Explain how radionuclide background concentrations were determined for EPC calculations. Explain how Ra-228 soil background concentration was determined. Clarify whether the most reasonably conservative value of background soil Ra-228 concentration was used for EPC determination.

Response 2: The data in Table 3-3 and Appendix D, Table 3-2 were the background concentrations from a previous radiological survey at SEAD-63 (Plexus, 2005). These data were referenced initially from the Work Plan (included as Attachment A to Appendix D) and were planned to be utilized to calculate net Ra-226 and Th-232 activities for Cabrera's Final Status Survey of Pits A/B and C at SEAD-12.

After the EPA, Army, Parsons, and Cabrera revised the approach to perform a retrospective risk/dose assessment report to assess the residual soils at SEAD-12, the site-wide background radiological and chemical data sets from the completed RI (Parsons, 2002) were utilized for the risk assessment for consistency. These background samples from the SEAD-25 RI, 25 ESIs, the Ash landfill, the OB Ground Site, as well as the SEAD-12 area were combined into one background dataset. The background concentrations for Ra-228 were calculated based on the background dataset sampling results for Ra-228 from the SEAD-12 RI (Parsons, 2002). The text and tables has been updated to reflect the source of background.

Comment 3: Appendix D, Table 7-2, 1. Detected Concentrations Columns. Basis: Some MAX values are lower than MIN values. 2. It's not clear the data source of the Pm-147 soil and sediment background concentrations. Appendix D Table 3-1 does not provide this information.

Recommendation 3: 1. Correct the values in table. 2. Include the data source for Pm-147 background concentrations.

Response 3: In Appendix D, Table 7-2, the groundwater, onsite surface water, and onsite sediment minimum and maximum detected concentrations values were inadvertently reversed. The detected concentration values in the downgradient sediment section are correct. The table has been revised accordingly.

Refer to response to Comment 1 to address the question on background data sources, which were originally presented in the Final SEAD-12 RI (Parsons, 2002) and were not considered relevant for the work addressed in the CCR.

Comment 4: Appendix D, Tables F-1, F-2. Bases: References are not provided for Dose Conversion Factors and Cancer Slope Factors in the tables.

Recommendation 4: Provide references for these parameter values in the tables.

Response 4: In Appendix D, Section 7.1.3, it states "RESRAD 6.5 utilizes Federal Guidance Report (FGR) No 11 and 12 DCF for determining radiological dose assessment to various receptors present at the site. Those DCFs are based on International Commission on Radiological Protection (ICRP) 30 publications…Attachment F provides the risk coefficients for each ROPC present at the site." The table has been updated and the references will be provided in the table.

Comment 5: Appendix D, Attachment C, Table C-2C. Basis: It's not clear why fission product Pm-147 is present in the background soil samples in noticeable concentrations. Pm-147 is relatively short-lived and is not commonly found in nature. If soil in the area is contaminated with a fission product, the area might not be suited as the site radionuclide soil background concentration reference area.

Recommendation 5: Provide discussion on why Pm-147 is present in the background soil samples in noticeable concentrations. Clarify whether background soil samples listed in Table C-2C used or not used as bases for radionuclide soil background concentrations. Clarify whether the soil background concentration reference area is free of radiological contamination of any kind. Discuss possibility of false nuclide identification for Pm-147 in the soil, water and sediment samples.

Response 5: Please refer to response to Comment 1. Pm-147 discussion was not included in the CCR based on the Final SEAD-12 RI report dated February 2002. There were no Pm-147 concentrations noted above the DGGLs in the RI report and it was not considered a ROPC. Table C-2C was brought forward from the RI and included in the CCR for the purpose of updating the risk assessment with updated information from the removal action performed at SEAD 12 waste pits. The Army believes that since no Pm-147 was identified in the waste pits during the removal, discussion is not warranted in the CCR.
