1.0 INTRODUCTION

This *2012 Annual Report – Year 5* for the former Abandoned Deactivation Furnace (SEAD-16) and the former Active Deactivation Furnace (SEAD-17) sites at the Seneca Army Depot Activity (SEDA or the Depot) in Romulus, Seneca County, New York provides a review of annual groundwater monitoring data collected in December 2012, comparisons of the 2012 data to other pre- and post-remedial action (RA) groundwater sampling events, recommendations for future long-term monitoring (LTM) at SEAD-16 and SEAD-17, and the annual review of the effectiveness of the remedy implemented at the sites in 2007.

In accordance with the Record of Decision (ROD) for SEAD-16 and SEAD-17 (Parsons, 2006) and the *Remedial Design Work Plan and Design Report* (Parsons, 2007) (Final Work Plan), a RA was completed in August 2007 for SEAD-16 and SEAD-17, or the areas of concern (AOCs). The RA consisted of the excavation, stabilization (as warranted), and disposal of soil contaminated with selected metals (antimony, arsenic, cadmium, copper, lead, mercury, thallium, and zinc) at levels above identified risk-based action levels from both AOCs. In addition, soil at SEAD-16 that was also contaminated with polyaromatic hydrocarbons (PAHs) at concentrations in excess of risk-based action levels was excavated, stabilized (if warranted), and disposed at a licensed landfill. The RA implemented is documented in the *Final Construction Completion Report for the Abandoned Deactivation Furnace (SEAD-16) and Active Deactivation Furnace (SEAD-17)* (Parsons, 2008). The RA at SEAD-16 involved the removal of approximately 1,862 cubic yards (cy) of soil impacted with metals and PAHs. The RA at SEAD-17 involved the removal of approximately 2,565 cy of metals-impacted soil.

The ROD for SEAD-16 and SEAD-17 also requires the implementation, maintenance, inspection, and periodic reporting of land use controls (LUCs) prohibiting use of the land at the AOCs for residential purposes and access to and use of groundwater until applicable cleanup standards are met. Applicable cleanup standards refer to the lowest enforceable standard recorded either on New York State Class GA (NYS Class GA) Ambient Water Quality Standards or United States Environmental Protection Agency (EPA) maximum contaminant levels (EPA MCLs). Once groundwater cleanup standards are achieved, the groundwater use restrictions may be eliminated upon approval of the EPA and the New York State Department of Environmental Conservation (NYSDEC). SEAD-16 and SEAD-17 are located within the Planned Industrial/Office Development and Warehousing (PID) area, which has area-wide LUCs that prohibit the development and use of the property for residential housing, elementary and secondary schools, childcare facilities, and playgrounds; and, prohibits access to and use of groundwater until concentrations have been reduced to levels that allow for unlimited exposure and unrestricted use.

The Land Use Control Remedial Design (LUC RD) Addendum #4 identifies and implements the LUCs required by the SEAD-16 and SEAD-17 ROD at the identified AOCs, as well as other AOCs (SEADs 1, 2, 5, 59, 71, 121C, and 121I) in the PID area. The LUC objectives for SEAD-16 and SEAD-17 are to prevent access to or use of groundwater until New York State GA groundwater standards are achieved, and to prohibit residential housing, elementary and secondary schools, child care facilities and playground activities at the sites. Implementation of the LUCs at SEAD-16 and SEAD-17 may include lease restrictions, an environmental easement, deed restrictions, zoning, periodic certification, and a five-year review as is defined in the *Final Land Use Control Design for SEAD-27, 66, and 64A* (Army, 2006). The

LUC RD for SEAD-27, 66 and 64A is also known as the *LUC RD for the Planned Industrial/Office Development or Warehousing Area* that proposed the establishment of an area-wide set of land use restrictions for the PID/Warehouse Area to simplify institutional control implementation by having a single set of land use restrictions for the PID/Warehouse Area, which are consistent with its anticipated industrial land use. The periodic certification will be submitted to the NYSDEC and EPA to document that the LUCs at SEAD-16 and SEAD-17 are unchanged and that no activities have occurred that impair or violate the ability of the LUCs to protect public health and the environment.

Long-term groundwater monitoring is being performed at SEAD-16 and SEAD-17 as part of the post-closure monitoring and maintenance (PCMM) operations in accordance with the ROD and as outlined in the Final Work Plan. Results for the first year (Year 1) LTM event performed in December 2007 are documented in the *Final Construction Completion Report for the Abandoned Deactivation Furnace (SEAD-16) and Active Deactivation Furnace (SEAD-17)* (Parsons, 2008). The Year 2 LTM event was performed in December 2008, with results documented in the *Final Annual Report – Year 2* (Parsons, 2009). Results for the Year 3 LTM sampling event conducted in November 2009 are documented in the *Final Annual Report – Year 3* (Parsons, 2010). The Year 4 LTM sampling event was conducted in December 2010 for both AOCs, with the results presented in the Draft *Final Annual Report – Year 4* (Parsons, 2011). No LTM sampling event was conducted in 2011 due to budgetary constraints. This report presents and discusses the results for Year 5's LTM event, which was conducted in December 2012.

2.0 SITE BACKGROUND

2.1 Site Description

SEDA, a 10,587-acre former military facility located in Seneca County near Romulus, New York, is located between Seneca Lake and Cayuga Lake in Seneca County, and is bordered by New York State Highway 96 to the east, New York State Highway 96A to the west, and sparsely populated farmland to the north and south. The facility was wholly owned by the United States Government and was operated by the Department of the Army between 1941 and 2000; since 2000, portions of the Depot have been transferred to other parties for reuse. SEDA's primary mission was the receipt, storage, maintenance, and supply of military items. A location map for SEDA is presented as **Figure 1**.

SEAD-16 and SEAD-17 are located in the east-central portion of the SEDA, within SEDA's former ammunition storage area in an area where vehicular and pedestrian access is restricted. SEAD-16 and SEAD-17 are located in the portion of SEDA where land is presently designated for future PID uses. The locations of SEAD-16 and SEAD-17 are shown in **Figure 2**.

Both AOCs were historically used for the demilitarization of various small arms munitions. The munitions deactivation process involved heating the munitions in a rotating steel kiln. The heat would cause the munitions to detonate once the detonation temperature was reached. The byproducts produced during this detonation were then either swept out of the kiln through the stack or expelled from the kiln as bottom ash or debris.

SEAD-16, the former Abandoned Deactivation Furnace, was used from approximately 1945 until the mid 1960s when its use ceased and the site was vacated. The site consisted of 2.6 acres of fenced land with grasslands in the north, east, and west; a storage area for empty boxes and wooden debris located to the west; and an unpaved roadway in the south. Building S-311, which previously housed the deactivation furnace, was located at the approximate center of this area, and was demolished as part of the RA at SEAD-16. Documentation of demolition activities is presented in the *Building Cleaning and Building Demolition Completion Report* (Parsons, 2008). Building S-366, known as the Process Support Building, is located to the northeast of former Building S-311, and is currently unused and vacant. In addition to Building S-366, two sets of SEDA railroad tracks and utilities are presently on-site.

SEAD-17, the former Active Deactivation Furnace, was constructed to replace the Abandoned Deactivation Furnace at SEAD-16. However, SEAD-17 was inactive after 1989 as a result of Resource Conservation and Recovery Act (RCRA) permitting issues. SEAD-17 formerly consisted of the deactivation furnace, associated air pollution control equipment, and a support building (Building S-367), which were demolished or dismantled during the RA. Details and results of the demolition are documented in the *Building Cleaning and Building Demolition Completion Report* (Parsons, 2008). The former SEAD-17 deactivation furnace facility and support building were surrounded by a crushed shale road, beyond which lie grasslands. An unpaved gravel road to the north permits vehicular access to SEAD-17.

2.2 Site Hydrology

The hydrogeologic setting of SEAD-16 and SEAD-17 is described in detail in Sections 3.1.6 and 3.2.6, respectively, of the *Final Remedial Investigation (RI) Report at the Abandoned Deactivation Furnace (SEAD-16) and the Active Deactivation Furnace (SEAD-17)* (Parsons, 1999). A brief summary of hydrogeologic conditions and chemical impacts as described in the RI Report is presented below.

2.2.1 SEAD-16

Three groundwater monitoring wells (MW16-1, MW16-2, and MW16-3) were installed as part of the Expanded Site Investigation (ESI) conducted at SEAD-16 in 1993/1994. Four additional groundwater monitoring wells (MW16-4, MW16-5, MW16-6, and MW16-7) were installed during the RI. As summarized in the *Final Construction Completion Report for the Abandoned Deactivation Furnace (SEAD-16) and Active Deactivation Furnace (SEAD-17)* (Parsons, 2008), MW16-3 was destroyed during the RA construction activities, and was not replaced as groundwater conditions on the southwest side of Building S-311 are adequately characterized by MW16-2 and MW16-5. The locations of the six existing groundwater monitoring wells and the former MW16-3 are shown on **Figure 3**.

Prior to the completion of the RA in August 2007, depth to groundwater was measured at SEAD-16 three times (April 1994, August 1996, and December 1996). Groundwater flow generally trends to the west based on previous subsurface investigations conducted at SEDA. Data from previous investigations suggest that a groundwater divide exists near, and approximately parallel to, Route 96 near Romulus, New York, indicating that the groundwater in the SEAD-16 area flows west. Based on available groundwater elevation data, it appears that there may be a regional groundwater high southwest of former Building S-311, which may contribute to local fluctuations in groundwater flow.

Horizontal hydraulic conductivities were determined for five wells screened in the till/weathered shale zone at SEAD-16. The saturated thickness in the till/weathered shale aquifer measured less than 2 feet when tested in September 1996. Hydraulic conductivity values for the shallow till/weathered shale aquifer ranged from 2.8×10^{-3} cm/sec to 2.5×10^{-2} cm/sec; the geometric mean was 7.3×10^{-3} cm/sec.

2.2.2 SEAD-17

Four groundwater monitoring wells (MW17-1, MW17-2, MW17-3, and MW17-4) were installed as part of the ESI conducted at SEAD-17. One additional groundwater monitoring well, MW17-5, was installed during the RI. The locations of the five groundwater monitoring wells installed at SEAD-17 are shown on **Figure 4**. Prior to the completion of the RA, depth to groundwater was measured at SEAD-17 in April 1994, August 1996, and December 1996 (the same time groundwater levels were measured at SEAD-16). Interpretation of groundwater elevation data indicates that groundwater flows to the southwest.

A horizontal hydraulic gradient of 0.01ft/ft was calculated between monitoring wells MW17-1 and MW17-3. Hydraulic conductivities were found to range from 2.9×10^{-3} cm/sec to 1.4×10^{-2} cm/sec.

2.3 Pre-Remedial Action Soil and Groundwater Conditions for SEAD-16

Pre-Remedial Action Soil Conditions

The primary historic constituents of concern (COCs) at SEAD-16 for soil included arsenic, copper, lead,

and zinc. The highest concentrations of soil contamination resulted from operations that were performed within and in close proximity to the former Abandoned Deactivation Furnace Building (S-311) and the Process Support Building (Bld. 366). Carcinogenic PAHs were detected in soils found at discrete locations within the AOC, with the highest concentrations detected in the surface soil samples collected adjacent to the northwestern corner of the former Abandoned Deactivation Furnace Building. Metals (antimony, copper, lead, mercury, and zinc) were found at concentrations greater than the site-specific cleanup goals in soil located in portions of the surrounding man-made drainage ditches.

Pre-Remedial Action Groundwater Conditions

Prior to completion of the RA, three rounds of low-flow groundwater sampling were conducted at SEAD-16, including one round in April 1994 as part of the ESI investigation activities, and two rounds in August and December 1996 as part of the RI activities. Compounds detected in the groundwater samples are presented in **Appendix A**. Refer to the RI Report for complete groundwater analyses. Metals were detected above either the applicable NYS Class GA standards or EPA MCLs. Concentrations exceeding applicable standards were less than or close to SEDA background concentrations, except for the exceedances of sodium. A summary of SEDA background groundwater data providing summary statistics (including maximum and average concentrations, the standard deviation for the collected data, and the frequency of detection) is provided in **Appendix B**. The Final Work Plan (Parsons, 2007) summarized that although metals had been detected in the groundwater above their respective standards during previous sampling events, the groundwater was not impacted by site activities. This conclusion was based on a comparison of results to the background groundwater data collected from unaffected parts of SEDA.

2.4 Pre-Remedial Action Soil and Groundwater Conditions for SEAD-17

Pre-Remedial Action Soil Conditions

The primary historic COCs in the soil at SEAD-17 were metals including antimony, arsenic, copper, lead, mercury, and zinc. The concentrations of metals were highest in samples collected closest to the location of the former Active Deactivation Furnace and its support building, particularly near the southwestern corner of the building.

Pre-Remedial Action Groundwater Conditions

Prior to the completion of the RA, three rounds of groundwater sampling were conducted at SEAD-17, concurrent with the sampling conducted at SEAD-16 as identified above. Compounds detected in the groundwater samples collected during the low-flow sampling events in 1996 are presented in **Appendix A**. Metals were detected at concentrations above the applicable NYS Class GA standards or EPA MCLs; however, these concentrations were lower than SEDA background concentrations, except for sodium. (See SEDA background groundwater data summary in **Appendix B.**) The Final Work Plan summarized that, although metals had been detected in the groundwater above their respective standards during previous sampling events, the groundwater was not impacted by site activities. This conclusion is based on a comparison of results to groundwater data collected from non-impacted areas of SEDA.

2.5 Remedial Action Summary

The selected remedy for SEAD-16 and SEAD-17 required the following:

- Excavation of soil impacted with metals and PAHs at concentrations greater than the site-specific cleanup standards;
- Stabilization of excavated soil exceeding the toxicity characteristic leaching procedure;
- Disposal of the material in an off-site landfill;
- Backfilling the excavated areas with clean backfill;
- Performing groundwater monitoring for select metals until groundwater concentrations do not exceed the applicable NYS Class GA or EPA MCL standards;
- Establishing and maintaining LUCs to prevent access to or use of groundwater and to prevent residential use of the land until cleanup standards are met; and
- Performing a review of the selected remedy every five years to evaluate if the remedy remains protective of the public health and the environment in accordance with Section 121(c) of the Comprehensive Environmental Remediation and Cleanup Liability Act (CERCLA).

The excavation of the impacted soil at SEAD-16 and SEAD-17 began on July 9, 2007 and was completed on August 2, 2007. Approximately 1,862 cy of impacted soil was removed from SEAD-16 and approximately 2,565 cy of impacted soil was removed from SEAD-17. The limit of the excavations performed at SEAD-16 is shown on **Figure 3** and for SEAD-17 on **Figure 4**.

Soil was excavated from both SEAD-16 and SEAD-17 until confirmatory soil samples collected from the sidewalls (when appropriate), the excavation floor, and the perimeter yielded analytical results below site-specific cleanup standards. The depth of excavation completed at SEAD-16 varied from 1 to 3 feet below ground surface (bgs) and the excavation depth at SEAD-17 varied from 1 to 2 feet bgs. The impacted soil from SEAD-16 and SEAD-17 was transported off-site, and was disposed as non-hazardous material at the Ontario County Landfill in Flint, New York.

Deeper excavations at SEAD-16 and SEAD-17, including excavation areas surrounding the railroad tracks, were backfilled with clean bank-run gravel. SEAD-16 and SEAD-17 were graded to promote positive drainage. The areas at SEAD-17 that were vegetated prior to the RA were seeded to restore the vegetation. SEAD-16 was not seeded since it was not previously vegetated.

3.0 LONG TERM MONITORING RESULTS

3.1 Summary of Year 1 LTM Event

The first post-RA groundwater LTM event (Year 1) was performed at SEAD16 and SEAD-17 between December 19, 2007 and December 21, 2007. The results of the Year 1 event are reported in the *Final Construction Completion Report for the Abandoned Deactivation Furnace (SEAD-16) and Active Deactivation Furnace (SEAD-17)* (Parsons, 2008). Only unfiltered groundwater samples were collected and analyzed during this sampling event. Well MW16-3 was removed during the RA and was not sampled.

In summary, at SEAD-16 five metals (antimony, iron, lead, manganese, and sodium) were detected at concentrations above the respective NYS Class GA or EPA MCL standards in one or more of the wells, including antimony in wells MW16-2, MW16-4, and MW16-7; iron in wells MW16-5 and MW16-6; lead in well MW16-7; manganese in well MW16-7; and sodium in wells MW16-1, MW16-2, MW16-4, and MW16-7). At SEAD-17, two metals (antimony and sodium) were each detected once in different wells (MW17-2 and MW17-4, respectively) at concentrations above the respective NYS Class GA groundwater standards. Concentrations of other metals detected at SEAD-16 and SEAD-17 were below the applicable NYS Class GA groundwater and EPA MCL standards. With the noted exception of sodium concentrations detected at SEAD-16, concentrations detected at both SEAD-16 and SEAD-17 were below SEDA background concentrations. The *Final Construction Completion Report for the Abandoned Deactivation Furnace (SEAD-16) and Active Deactivation Furnace (SEAD-17)* (Parsons, 2008) concluded that the groundwater did not appear to be impacted by historic site activities.

3.2 Summary of Year 2 LTM Event

The second post-RA LTM event (Year 2) was performed at SEAD-16 and SEAD-17 between December 9, 2008 and December 11, 2008. The results of the Year 2 event were reported in *Final Annual Report – Year 2* (Parsons, 2009). Only unfiltered groundwater samples were collected and analyzed during the Year 2 sampling event.

Four metals (antimony, iron, lead, and sodium) were detected in wells at SEAD-16 at concentrations above the respective NYS Class GA or EPA MCL standards, including antimony in wells MW16-2, MW16-5, and MW16-7; iron in wells MW16-5 and MW16-7; lead in well MW16-7; and sodium in wells MW16-1, MW16-2, MW16-4, and MW16-7. At SEAD-17, two metals (iron and manganese) were detected at concentrations above the applicable NYS Class GA standards in wells MW17-3 (iron and manganese) and MW17-4 (iron). Concentrations of other metals detected at SEAD-16 and SEAD-17 were below the applicable NYS Class GA or EPA MCL standards. *The Final Annual Report – Year 2* (Parsons, 2009) concluded that the groundwater does not appear to be impacted by historic site activities and there does not appear to be an indicator of deteriorating conditions at SEAD-16 and SEAD-17.

3.3 Summary of Year 3 LTM Event

The third post-RA LTM event (Year 3) was performed at SEAD-16 and SEAD-17 between November 12, 2009 and November 18, 2009. The results of the Year 3 event were reported in *Draft Final Annual*

Report – Year 3 (Parsons, 2010). Both filtered (i.e., dissolved) and unfiltered (i.e., total) samples were collected and characterized during this sampling event.

Three metals (antimony, iron, and sodium) were detected in unfiltered groundwater samples from SEAD-16 at concentrations above the applicable NYS Class GA standards in wells MW16-2 and MW16-7 (antimony); in wells MW16-4, MW-16-5, and MW16-6 (iron); and in wells MW16-1, MW16-2, MW16-4, and MW16-7 (sodium). At SEAD-17, antimony, iron, manganese, lead, and sodium were detected in the unfiltered sample collected from well MW17-2 at concentrations above the applicable NYS Class GA or EPA MCL standards; iron was detected above its NYS Class GA standard in the filtered and unfiltered samples collected from MW17-3; and sodium was detected above its NYS Class GA standard in the filtered and unfiltered samples at MW17-5.

Filtered and unfiltered sample results for SEAD-16 were similar for antimony and sodium in the wells as indicated above; however, unfiltered results for iron were somewhat higher than the filtered samples in wells MW16-4 and MW-16-5. Filtered and unfiltered sodium concentrations were similar in the SEAD-17 wells, but filtered and unfiltered iron concentrations in wells MW17-2 and MW17-3 were significantly different, with the unfiltered concentrations the highest in both cases.

Concentrations of the other metals detected at SEAD-16 and SEAD-17 were below the applicable NYS Class GA or EPA MCL standards. Similar to the results of the Year 2 LTM event, the *Draft Final Annual Report – Year 3* (Parsons, 2010) concluded that the groundwater does not appear to be impacted by historic site activities and there does not appear to be an indication that conditions are deteriorating at SEAD-16 and SEAD-17.

3.4 Summary of Year 4 LTM Event

The Year 4 LTM groundwater sampling event was conducted at SEAD-16 and SEAD-17 between December 13, 2010 and December 17, 2010. Filtered and unfiltered groundwater samples were collected from the six monitoring wells located at SEAD-16, and from the five monitoring wells located at SEAD-17. Concentrations of metals (including antimony, sodium, and iron) exceeding the applicable NYS Class GA standards were detected in the filtered and unfiltered samples collected from five of the six wells (MW16-1, MW16-2, MW16-4, MW16-5, and MW16-7) sampled at SEAD-16. Antimony and sodium were detected above the applicable NYS Class GA standard in MW16-2 and MW16-7; sodium was detected above the applicable NYS Class GA standard in MW16-1 and MW16-4; and iron was detected above the applicable NYS Class GA standard in MW16-5. Concentrations of antimony and sodium were similar for unfiltered and filtered samples, with the highest concentrations of antimony and sodium detected in MW16-7 and MW16-4, respectively. Iron exceedances were found in the unfiltered and filtered samples collected from MW16-5.

At SEAD-17, inorganic constituents were detected at concentrations below the applicable NYS Class GA and EPA MCL standards in both the filtered and unfiltered samples collected from the five monitoring wells with the exception of MW17-3. Similar to the results of the Year 3 LTM event, iron was the only metal detected above the applicable NYS Class GA standard in both unfiltered and filtered samples collected from MW17-3.

Similar to the results of previous LTM events, the *Draft Final Annual Report 2010 – Year 4* (Parsons, 2011) concluded that although there were exceedances of select metals found at both SEAD-16 and SEAD-17, the groundwater does not appear to be impacted by historic site activities and therefore does not appear to indicate that groundwater conditions are deteriorating at either SEAD-16 and SEAD-17.

3.5 Year 5 LTM Event

The Year 5 post-RA LTM event was conducted at SEAD-16 and SEAD-17 from December 11, 2012 through December 15, 2012. Filtered and unfiltered groundwater samples were collected from six monitoring wells located at SEAD-16 and from five monitoring wells located at SEAD-17. This is the third sampling event that includes the collection of filtered and unfiltered samples.

Field forms completed for the Year 5 sampling event are included in **Appendix C**. Prior to the collection of groundwater samples from each of the monitoring wells, groundwater elevation measurements were collected at each of the wells to be sampled. Groundwater elevation data for the Year 5 LTM event, as well as historic data, are presented in **Table 1** and **Table 2** for SEAD-16 and SEAD-17, respectively.

3.5.1 Year 5 LTM Sample Collection

Samples for the Year 5 LTM event were collected using low flow sampling techniques. A peristaltic pump was used in place of a bladder pump to collect the groundwater samples due to anticipated winter weather conditions, including possible standing air temperatures below 32 degrees Fahrenheit (0 degrees Celsius). A peristaltic pump is recommended for freezing conditions since the bladder pump recharge cycle sequence allows water to freeze in the exposed portion of the sample tubing, which may inhibit sample collection efforts if ice plugs form in the tubing.

Sample collection, handling and custody, holding times, and field parameter collection procedures were conducted in accordance with the *Revised Final Sampling and Analysis Plan for Seneca Army Depot Activity* (SAP) (Parsons, 2006c). Samples collected from the six SEAD-16 wells and the five SEAD-17 wells were submitted to TestAmerica (Savannah, GA) for the following analyses:

- Total Analyte List (TAL) metals, exclusive of mercury, by USEPA SW846 Method 6020; and
- Mercury by USEPA SW846 7470A.

TestAmerica's Savannah, GA laboratory is certified by the Department of Defense's (DoD's) Environmental Laboratory Accreditation Program (ELAP) and the NELAC National Environmental Laboratory Accreditation Program (NELAP) for the above analyses/analytical methods for both potable and non-potable water.

Quality control (QC) samples, including one duplicate and one matrix spike/matrix spike duplicate (MS/MSD) pair, were collected at MW16-7. In the field, pH, oxidation-reduction potential (ORP), dissolved oxygen (DO), conductivity, temperature, and turbidity data were collected from each well during the purging cycle; filtered turbidity data was collected for each location after the filtered sample was collected; and pH, ORP, DO, conductivity, temperature, and turbidity data were also collected from each well after samples had been collected to assess overall sample sequence stability. A summary of the

pre- and post-sampling field parameters is provided in **Table 3** and **Table 4** for SEAD-16 and SEAD-17, respectively.

3.5.2 Year 5 LTM Sample Filtering

As documented in *Final Annual Report – Year 2* (Parsons, 2009), *Draft Final Annual Report – Year 3* (Parsons, 2010), and *Draft Final Annual Report 2010 – Year 4* (Parsons, 2011) some of the metal concentrations that exceed NYS Class GA or EPA MCL standards in SEAD-16 and SEAD-17 wells may be associated with the groundwater turbidity fluctuations encountered in the wells at the time of sampling. For example, several of the samples (e.g., MW16-1, MW16-4, MW16-7, MW17-1, and MW17-4) collected during the Year 3 monitoring event had very low levels of turbidity [i.e., less than 1 Nephelometric Turbidity Unit (NTU)] which resulted in similar metal concentrations reported for both the filtered and unfiltered samples. Conversely, certain metals (most notably aluminum, iron, and manganese in many wells) and specific metals such as lead (as detected in MW16-7, MW17-2 and MW17-3) appear to be affected by filtering, which suggests that the reported metal results may be due to the presence of soil in the samples analyzed. Concentrations measured for several metals (antimony, calcium, magnesium, potassium and sodium) are unaffected either by variations in turbidity level or by sample filtering, suggesting that these metals may be present as dissolved species in the groundwater. With this in mind, both unfiltered and filtered samples were collected for the Year 5 LTM event: samples were collected directly from the well as unfiltered samples, and then another sample was collected and filtered through a 0.45-micron membrane filter was used to collect the filtered sample.

Both the filtered and unfiltered samples from SEAD-16 and SEAD-17 wells were analyzed for TAL metals by the methods listed in **Section 3.5.1.** The unfiltered and filtered concentrations of metals detected in samples collected from SEAD-16 and SEAD-17 wells is shown in **Table 5A** and **Table 5B**, respectively.

Turbidity levels recorded immediately prior to sample collection ranged from 0.48 NTU (MW16-4) to 3.6 NTUs (MW17-1). Turbidity levels recorded after the collection of both unfiltered and filtered samples ranged from 0.87 NTU (MW16-1) to 3.58 NTU (MW17-1). Filtered water turbidity levels ranged from 0 NTU to 0.4 NTU, as would be expected after passing through a 0.45-micron membrane filter.

Review of the Year 5 data supports the conclusions drawn from interpretation of Year 3 and 4 data, and show that in cases where groundwater turbidity level is low, the difference between the metals concentrations for both filtered and unfiltered samples is minimal. Samples collected from MW16-1, MW16-4, and MW16-7 during the Year 5 monitoring event had very low turbidity levels (i.e., less than 1.7 NTU) which resulted in similar metal concentrations reported for both the filtered and unfiltered samples from these wells. Concentrations of some metals, such as iron, detected in six wells (M16-4, MW16-5, MW16-6, MW17-1, MW17-4 and MW17-5) showed decreases in concentration that may be attributed to filtering. Concentrations measured for several metals (i.e., antimony, calcium, magnesium, potassium and sodium) appear to be unaffected by either variation in turbidity levels or by sample filtering, suggesting that these metals are dissolved in the groundwater.

3.6 Year 5 Groundwater Elevations for SEAD-16 and SEAD-17

Groundwater elevations were measured on December 11, 2012 at SEAD-16, and on December 15, 2012 at SEAD-17. Groundwater elevation data, including historic groundwater elevation data, for SEAD-16 and SEAD-17 is presented as **Table 1** and **Table 2**, respectively.

Groundwater elevation data collected during previous investigations indicate that groundwater generally flows to the southwest at SEAD-16; however, historical groundwater elevation data also indicate that localized variation in groundwater flow direction may be due to higher groundwater elevations observed to the northeast and southwest of Building 311. During the most recent (Year 5) LTM event, and similar to the Year 4 LTM groundwater flow observations at SEAD-16, groundwater elevation data suggest that there is a groundwater low in the vicinity of the former Building 311 location. The higher groundwater elevations to the northeast and southwest of the apparent groundwater low in the vicinity of Building 311 result in two apparent local groundwater flow directions (to the southeast and northwest, respectively) as shown on **Figure 5**.

Based on the most recent elevation data (December 2012), groundwater at SEAD-17 appears to flow generally to the west-southwest as shown on **Figure 5**, which is consistent with historical groundwater flow observations at SEAD-17.

3.7 Summary of Year 5 Groundwater Data Analysis for SEAD-16

A summary of metals detected in groundwater during the Year 5 LTM event for SEAD-16 is presented in **Table 5A**. Complete groundwater data results are presented in **Appendix D**. A discussion of data validation results is presented in **Appendix F**; there were no non-compliance issues reported. Data validation utilized the EPA Region 2 Standard Operating Procedures (SOPs). The SOPs were revised in March 2013, immediately prior to the submission of this report. Therefore, previous versions of the SOP were used in order to be consistent with the previous rounds. The revised March 2013 SOPs will be used for the Year 6 Annual Report. Concentrations of metals including antimony, iron, and sodium were detected above applicable NYS Class GA standards in both filtered and unfiltered samples, including metals exceedances for filtered samples from five of the six wells, and unfiltered sample exceedances from the six wells.

Antimony exceeded the NYS Class GA standard of 3 μg/L for both the filtered and unfiltered samples collected from three wells (MW16-2, MW16-4, and MW16-7). The highest concentrations of antimony were found at well MW16-7, where concentrations of 13.5 μg/L and 14.0 μg/L, were found in the unfiltered and filtered samples, respectively. Antimony concentrations measured in the unfiltered versus filtered samples collected from MW16-2 were also comparable, with the unfiltered sample yielding a concentration of 7.1 μg/L, and the filtered sample's concentration was 7.8 μg/L. Unfiltered and filtered samples from MW16-4 yielded the lowest concentrations of 3.9 μg/L and 4 μg/L, respectively.

Iron exceeded the NYS Class GA standard (300 μg/L) in the unfiltered and filtered samples analyzed from well MW16-5, with unfiltered and filtered sample concentrations of 1,300 μg/L and 1,100 μg/L, respectively. Iron additionally exceeded the NYS GA standard at a concentration of 790 μg/L in the unfiltered sample collected from MW16-6.

Concentrations of the sum of iron and manganese compounds detected in unfiltered and filtered samples collected from well MW16-5 also exceeded the combined NYS Class GA standard of 500 µg/L with the primary contributing metal being iron. Although manganese was detected in the unfiltered and filtered groundwater samples collected from the six SEAD-16 wells, it was not detected at concentrations above its NYS Class GA standard (300 µg/L) during the Year 5 LTM event.

Sodium was detected at concentrations above the NYS Class GA standard (20,000 µg/L) in unfiltered and filtered samples collected from SEAD-16 wells MW16-1, MW16-4, and MW16-7. The highest concentrations were detected in the unfiltered and filtered samples collected from well MW16-4 at concentrations of 310,000 µg/L and 340,000 µg/L, respectively. Sodium exceedances were also found in the MW16-1 unfiltered and filtered samples at concentrations of 62,000 µg/L and 63,000 µg/L, respectively; and in the MW16-7 filtered and unfiltered samples at concentrations of 35,000 µg/L and 32,000 µg/L, respectively. The duplicate of MW16-7 had similar sodium concentrations.

In summary, select metals including antimony, iron, and sodium continue to be detected in the groundwater at SEAD-16 at levels that exceed NYS Class GA standards. In general, however, there does not appear to be evidence of an area-wide or expanding plume at SEAD-16, as illustrated by the generally stable occurrence of metals concentrations identified across the groundwater monitoring well network during the LTM sampling events. Access to and use of the groundwater is restricted at the AOC under the terms of the ROD and the groundwater is not being used as a potable water source. A non-groundwater sourced municipal water supply is available for SEDA and currently includes the PID area. The groundwater access/use restriction will remain in effect at SEAD-16 until the select metal concentrations in groundwater have been reduced to levels below applicable NYS Class GA and EPA MCL standards, and until data demonstrating acceptable groundwater quality in the AOC is provided to and approved by the applicable regulatory agencies.

3.8 Summary of Year 5 Groundwater Data Analysis for SEAD-17

A summary of metals detected in the Year 5 groundwater samples event for SEAD-17 is presented in **Table 5B**. Complete groundwater analytical results are presented in **Appendix D**. Concentrations of metals in MW17-1, MW17-3, MW17-4, and MW17-5 were detected below the applicable NYS Class GA and EPA MCL standards in both the filtered and unfiltered samples. Antimony was detected at concentrations exceeding the NYS Class GA standard of 3µg/L in the filtered and unfiltered samples collected from MW17-2 at concentrations of 4 (J) µg/L and 4.4 (J) µg/L, respectively (note that the concentrations reported are followed by the "J" qualifier, which indicates that the reported value is estimated).

The SEAD-17 Year 5 data continues to demonstrate that the groundwater at SEAD-17 has not been impacted by metals released from the former Active Deactivation Furnace site. Although the concentrations of antimony were identified at concentrations above the applicable NYS Class GA standards, the results are similar to what has been observed historically at the site, and indicate that there has not been a significant change in groundwater conditions. Access to and use of the groundwater is restricted at the AOC under the terms of the ROD, and is not being used as a potable water source. A

non-groundwater sourced municipal water supply is available for the Depot, and currently includes the PID area. The groundwater access/use restriction will remain in effect at SEAD-17 until select metal concentrations in groundwater have been reduced to levels below applicable NYS Class GA and EPA MCL standards, and until data demonstrating acceptable groundwater quality in the AOC is provided to and approved by the applicable regulatory agencies.

3.9 Groundwater Data Trends

A comparison of data collected during the Years 1 to 5 LTM events to groundwater conditions noted prior to the RA is provided for SEAD-16 and SEAD-17 in the following discussions. Summaries of metal exceedances detected during the Year 5 groundwater monitoring event for SEAD-16 and SEAD-17 is provided in **Table 5A** and **Table 5B**, respectively. The complete data set for Year 1 through Year 5 LTM events is included as **Appendix D**.

3.9.1 Review of Groundwater Trends for SEAD-16

ESI and RI Data

Review of SEAD-16 data presented in the RI Report indicated that one or more concentrations measured for 14 metals (including arsenic, antimony, barium, beryllium, chromium, copper, iron, lead, manganese, mercury, nickel, selenium, sodium, and thallium) in 19 unfiltered groundwater samples collected during the ESI (performed in 1993/1994) and/or the RI (performed in 1999) exceeded NYS Class GA or EPA MCL standards in effect at the time of analysis. Of the 39 total instances where groundwater concentrations exceeded NYS Class GA or EPA MCL standards, 22 exceedances were associated with samples collected with peristaltic pumps (e.g., for the ESI sampling event) while the remaining 17 exceedances were found in samples collected using low-flow bladder pumps. Sample turbidities recorded during the RI sampling events were significantly lower than those recorded during the ESI sampling event, and thus are believed to be more representative of the water quality located at the site prior to the RA. Examination of the RI groundwater data shows that six metals were detected at concentrations in excess of NYS Class GA or EPA MCL standards in effect at the time of analysis:

- antimony (detected 2 times);
- iron (detected 5 times);
- lead (detected 1 time);
- manganese (detected 2 times);
- sodium (detected 3 times); and
- thallium (detected 4 times).EPA MCL

Of these detections, antimony was detected at concentrations above the applicable NYS Class GA standard only in well MW16-3, with a maximum concentration of 12.3 µg/L. Iron was found at elevated concentrations in three wells: MW16-1 (at a maximum concentration of 2,400 J[1] µg/L), MW16-2, and

[1] The "J" data qualifier is used to indicate that the reported concentration is estimated.

MW16-3. Lead was detected only in MW16-3 at a maximum concentration of 24.1 J µg/L; manganese was detected at elevated concentrations only in MW16-6 with a maximum level of 1,380 µg/L; sodium was detected in two wells (MW16-5 and MW16-6) with a maximum concentration of 409,000 µg/L detected at MW16-6; and thallium was detected in three wells including (MW16-2, MW16-5, and MW16-6), with a maximum concentration of 11 µg/L detected at MW16-6.

Post-Remedial Action Data

Over the six years since the completion of the RA at SEAD-16, a total of 56 groundwater samples, including 38 unfiltered and 18 filtered groundwater samples have been collected from the six wells located on SEAD-16. Amongst the 56 characterized groundwater samples, there have been eighty-one exceedances of individual applicable NYS Class GA or EPA MCL standards. These exceedances were primarily distributed across five metals consisting of antimony (28 exceedances), iron (14 exceedances), lead (two exceedances), manganese (one exceedance), and sodium (36 exceedances). Of the 81 exceedances, 22 were detected in the filtered samples and 46 were detected in unfiltered samples.

Antimony concentrations exceeding the NYS Class GA standard of 3 µg/L have been detected 28 times and most frequently have been detected in two wells, MW16-2 and MW16-7. Antimony detections above the NYS Class GA standards have inconsistently been found in well MW16-4 (five times, including two filtered from LTM events 4 and 5 and three unfiltered from LTM events1, 3, and 5); and in MW16-5 (one unfiltered sample). Filtered and unfiltered sample results for antimony from wells MW16-2 and MW16-7 are generally comparable, suggesting that the metal is present as a dissolved species. The highest concentrations are found consistently in well MW16-7 where the overall maximum concentration (16.3µg/L) was detected in the sample/duplicate collected during the Year 3 sampling event in 2009. This maximum concentration is approximately equivalent to what was detected in the groundwater at the former MW16-3 prior to the RA.

Exceedances of the NYS Class GA standard for iron were noted 14 times, distributed across wells MW16-4 through MW 16-7 over the five LTM sampling events. Iron concentrations noted in filtered samples are generally lower than concentrations found in unfiltered samples indicating that the iron concentrations are somewhat dependant of turbidity levels present in the groundwater at the time of sampling. The highest post RA concentration of iron detected in the groundwater at SEAD-16 is 1,300 µg/L (MW16-5, Year 5 LTM sampling event), which is roughly half of what was detected in the groundwater at the site prior to the RA.

Lead has been detected less frequently (22 of 56 LTM samples) and at lower concentrations (two exceedances post RA) in groundwater during the five years of post-RA monitoring. The two noted post-RA exceedances of the lead EPA MCL both occurred in well MW16-7 during the first and second LTM sampling events. Both of these samples were unfiltered, and since the last exceedance at MW16-7, lead levels in both the filtered and the unfiltered samples collected from this well have trended downward.

Sodium is a persistent contaminant identified in SEAD-16 wells, as it has been detected in every sample collected from the site, and at levels in excess of its NYS Class GA standard in 36 of the 54 samples. Sodium concentrations detected in the groundwater are currently higher than what was found prior to the

RA, with concentrations possibly affected by the known county highway salt pile operation that is operated by the Seneca County Highway Department (located approximately 1,000 feet upgradient to the east-northeast of SEAD-16). The location of the county highway department salt piles are indicated on **Figure 5**.

Although enough data points are available to perform a limited statistical analysis [e.g., using the combined SEAD-16 pre-RA (1 to 3 samples per well) and post-RA (5 samples per well) datasets], the overall limited availability of data points and the high percentage of non-detects in the metal constituents results would not be conducive to providing a comprehensive evaluation. A review of the EPA's *Groundwater – Unified Guidance* (EPA 2009) document provides numerous statistical methodologies; however, although the present number of data points could be used to perform a statistical analysis. The guidelines recommend 10 to15 distinct data points for accurate and meaningful results. Based on the limited data available the results would be inconclusive since there are at most five distinct data points for antimony in two of the wells (MW16-2 and MW16-7). Following the additional annual LTM events it is anticipated that a sufficient number of data points will be available to conduct a statistical analysis of the post-RA sampling data.

3.9.2 Review of Groundwater Trends at SEAD-17

ESI and RI Data

Review of SEAD-17 data presented in the RI Report indicated that one or more concentrations measured for five metals (i.e., iron, lead, sodium, and thallium) in 12 unfiltered groundwater samples exceeded NYS Class GA or EPA MCL standards in effect at the time of analysis. Of the 16 instances where groundwater concentrations exceeded the NYS Class GA or EPA MCL standards, 10 were associated with samples collected with a peristaltic pump (ESI sampling event) while the remaining six were found in samples collected using low-flow sampling with a bladder pump. As was indicated above for SEAD-16, sample water turbidities recorded during the RI sampling events were lower than those recorded during the ESI sampling event, and thus the analytical results from the RI samples are believed to be more representative of the water quality present at SEAD-17. Examination of the RI groundwater data indicates that only three metals (iron, sodium, and thallium) were detected at concentrations above NYS Class GA or EPA MCL standards in effect at the time of analysis. Of these detections, iron was detected at an elevated concentration in one well (MW17-1 at a concentration of 572 J µg/L); sodium was detected in two wells (MW17-3, at a maximum concentration of 30,100 µg/L, and at MW17-4); and thallium was detected in two wells (MW17-1 at a maximum concentration of 7.1 µg/L, and at MW17-5).

Post-Remedial Action Data

Since the completion of the RA at SEAD-17, a total of 40 groundwater samples including 25 unfiltered and 15 filtered groundwater samples have been collected from the five wells located on SEAD-17. Eighteen exceedances of NYS Class GA or EPA MCL standards primarily distributed across five metals have been detected, including antimony (four exceedances), iron (seven exceedances), lead (one exceedance), manganese (two exceedances), and sodium (four exceedances). Of the 20 NYS Class GA or EPA MCL standard exceedances, five exceedances were detected in the filtered samples and 15 were

detected in unfiltered samples. No exceedances of NYS Class GA or EPA MCL standards have been detected in well MW17-1 since the start of the post-RA LTM activities. Eight exceedances have been found in MW17-2; five exceedances have been found in well MW17-3 (with each of these exceedances of the NYS Class GA standard for iron); three exceedances in MW17-4; and two sodium exceedances found in MW17-5.

Exceedances of the 3 µg/L NYS Class GA standard for antimony were detected at MW17-2 in the unfiltered samples during the first and third sampling events; and during the most recent (2012) sampling event in both the filtered and unfiltered samples. The unfiltered sample from MW17-2 collected during the Year 3 event (2009) did not contain antimony concentrations in excess of the 3 µg/L EPA MCL standard. The maximum concentration reported for antimony was 3.7 µg/L detected in the MW17-2 Year 3 unfiltered sample. Exceedances of the NYS Class GA standard for iron were noted seven times in samples collected from three wells (MW17-2 with one exceedance; MW17-3 with five exceedances; and one exceedance at MW17-4). The maximum iron concentration was detected in the unfiltered sample collected from MW17-2 during the third sampling event (2009). Iron was not detected in the filtered sample collected during this event. This result therefore is presumed attributable to the elevated turbidity of the sample at the time of collection, which may also have impacted the other metal detections also reported (antimony, lead, and manganese) in this sample. Iron concentrations detected in five samples collected from MW17-3 (including three unfiltered and two filtered samples) were all above the applicable 300 µg/L NYS Class GA standard. Iron results from the filtered and unfiltered samples collected during the third (2009) LTM sampling event suggest that turbidity may have impacted the results for these analyses; however, iron in the filtered samples collected during this LTM event still exceeded the NYS Class GA standard.

Lead has been detected above the EPA MCL standard only once on the site since the completion of the RA in MW17-2 (unfiltered sample collected during the third LTM sampling event in 2009). Lead was not detected in the filtered sample, as the lead concentration in this sample was not above 2.9 µg/L U[2].

Manganese concentrations reported for samples collected from MW17-2 (in the unfiltered sample collected during the Year 3 LTM sampling event in 2009) and MW17-4 (in the unfiltered sample collected during the Year 2 LTM sampling event in 2008) exceeded the NYS Class GA standard of 300 µg/L. The sample collected from MW17-4 yielded the highest manganese concentration of 911 µg/L.

Sodium was detected at levels in excess of the 20,000 µg/L NYS Class GA standard four times in samples collected from MW17-2, MW17-4 and MW17-5. Of these detections, the sample results from MW17-5 are the most notable as the filtered/unfiltered samples collected during the Year 3 LTM sampling event (2009) both were in excess of 360,000 µg/L. Sodium results for the Year 2 (2008) and Year 4 (2010) LTM events for this well were all below 10,000 µg/L, suggesting the Year 3 (2009) results are possibly a seasonal anomaly.

In general, post-RA LTM results indicate that groundwater quality at SEAD-17 is not impacted by historic operations conducted in this area. Many of the identified groundwater quality exceedances

[2] A "U" data qualifier was used to indicate that the analytical results for lead in the unfiltered sample were not detected at a concentration above 2.9 µg/L.

appear to be affected by turbidity issues (e.g., samples collected from MW17-2), while other exceedances of iron, manganese, and sodium appeared either as random occurrences (e.g., sodium at MW17-5) or may be attributable to iron and manganese groundwater concentrations that are identified regionally in Seneca County. Similar to SEAD-16, based on the limited data for SEAD-17 including pre-RA (1 to 3 samples per well) and post-RA (5 samples per well) datasets, the generally limited available data points and the high percentage of non-detects in the metal constituents results would yield inconclusive results. A review of the EPA's Groundwater – Unified Guidance (EPA, 2009) document provides numerous statistical methodologies which recommend more data points than are presently available. Once a sufficient number of data points has been obtained, a statistical analysis of the post-RA sampling data can be conducted.

3.10 Routine Inspections of SEAD-16 and SEAD-17 Monitoring Wells

Observation of the wells at SEAD-16 and SEAD-17 during the Year 5 LTM event indicates that the wells located on the site are in acceptable condition. No root material or other obstructions were observed in the wells at SEAD-16 and SEAD-17 during the Year 5 sampling event.

4.0 REMEDY EVALUATION

As discussed above in **Section 2.5**, approximately 4,427 cy of metal and PAH impacted soil were removed from SEAD-16 and SEAD-17 during the RA conducted in the summer of 2007. The impacted soil was removed to minimize or eliminate the migration of hazardous contaminants from soil to groundwater. Soil that exceeded the site-specific cleanup standards, as based on the confirmatory soil data, was removed from SEAD-16 and SEAD-17.

The long-term groundwater monitoring performed over five years following the completion of the 2007 RA shows that the soil removal remedy has been effective in minimizing the migration of select metals from soil to groundwater. Pre-RA groundwater quality concerns associated with arsenic, barium, beryllium, chromium, copper, iron, lead, mercury, nickel and thallium have been eliminated, as each of these metals, with the exception of lead, have not been detected in the groundwater at SEAD-16 in excess of the applicable NYS Class GA or EPA MCL standards since the RA was completed. Lead was found twice at levels in excess of the applicable EPA MCL, but these exceedances were confined to a single well (MW16-7) during the Year 1 and Year 2 post-RA LTM sampling events; lead exceedances in MW16-7 have not been detected during subsequent sampling events. While iron and manganese concentrations in excess of NYS Class GA groundwater quality standards are still present, these results appear to be partially affected by turbidity issues or are attributable to the regional groundwater quality, and are not attributable to site activities. Noted sodium exceedances found in the groundwater at SEAD-16 appear to originate from the salt storage area located upgradient of SEAD-16 which is operated by the Seneca County Highway Department. Antimony continues to be detected at concentrations above the applicable NYS Class GA standard, but these exceedances appear to be limited to two wells where concentrations have remained generally consistent since the RA was completed.

The groundwater quality at SEAD-17 appears to have improved since the completion of the RA. The few noted groundwater quality exceedances for metals other than iron and manganese appear to be limited to the initial Year 1 or Year 2 post-RA sampling events or to a sample where a turbidity impact is suspected (e.g., the sample collected from MW17-2 during the Year 3 LTM event), and where groundwater quality has improved since the exceedances were reported. The noted iron exceedances reported for SEAD-17 are isolated and are most likely attributable to regional groundwater quality.

The remedy for SEAD-16 and SEAD-17 includes the implementation and maintenance of LUCs consisting of:

- Prevention of residential housing, elementary and secondary schools, childcare facilities and playground activities; and
- Prevention of access to or uses of the groundwater until concentrations are below the NYS Class GA Groundwater or EPA MCL standards.

As part of the LTM program, SEAD-16 and SEAD-17 were inspected to determine if the LUCs are being maintained. During the Year 5 event, it was confirmed that no residential housing, elementary and/or secondary schools, childcare facilities, or playgrounds have been constructed or established in these

AOCs, and no access to or use of groundwater, beyond that which is gained by the existing monitoring well network, was evident at either SEAD-16 or SEAD-17.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 Conclusions

- The soil excavation remedy at SEAD-16 and SEAD-17 has been effective controlling, and in some cases eliminating, the migration of select metals from soil to groundwater based on evaluation of the results of the five post-RA LTM sampling events.
- The results of the Year 5 LTM event continue to demonstrate that field filtering may be an effective tool for identifying and evaluating an association between turbidity impacts and groundwater analytical data.
- Post-remediation groundwater monitoring results indicate that the groundwater has not been impacted by site activities, although concentrations were detected above the NYS Class GA or EPA MCL standards.
- The land use and groundwater use restrictions imposed at SEAD-16 and SEAD-17 are maintained and there are no signs of unauthorized use or access to the AOCs.

5.2 Recommendations

Based on evaluation of the pre-RA groundwater data and the data collected during Years 1 through 5 of the post-RA LTM program at SEAD-16 and SEAD-17, the Army recommends that groundwater monitoring continue on an annual basis at SEAD-16 and SEAD-17.

Notes:
(1) Elevations are relative to the North American Vertical Datum (NAVD) 1988.
(2) April 4, 1994 data were collected as a part of the ESI and August 1996 and December 1996 were collected during the Remedial Investigation phase.
(3) Monitoring well MW16-3 was destroyed during the remedial action conducted at SEAD-16.
(4) PVC riser pipe for wells MW16-2 and MW16-5 was necessary to be cut during December 2008 sampling event due to the PVC preventing the metal casing lid from opening.
(5) MW16-2 and MW16-5 were re-surveyed in Dec 2008 and this data was used for water table elevation calculations. MW16-2 Top of PVC elevation is 733.48 ft, and MW16-5 Top of PVC elevation is 735.82 ft.
(6) Wells were re-surveyed with GPS RTK equipment in November 2012. New ground surface and top of the PVC elevations were used for the December 2012 water table elevation calculation.
NA = Not Available.

Notes:
1. The criteria values (where available) are NYS Class GA Groundwater Standards (TOGS 1.1.1, June 1998) and EPA Maximum Contamination Limit (MCL), Source http://www.epa.gov/safewater/mcl.html#inorganic.html
2. Shading indicates a concentration above the GA or MCL groundwater standard.
3. Dissolved samples were field filtered using a 0.45 micro filter.
4. A blank in the Criteria Level column indicates no standard established for that compound.

U = compound was not detected
J = the reported value is an estimated cocentration
SA = Sample
DU = Duplicate Sample

Notes:
1. The criteria values are NYSDEC Class GA Groundwater Standards (TOGS 1.1.1, June 1998) and EPA Maximum Contamination Limit (MCL), Source http://www.epa.gov/safewater/mcl.html#inorganic.html
2. Shading indicates a concentration above groundwater standard.
3. A blank in the action level column indicates no Class GA and/or MCL standand or standard is a secondary value.

U = compound was not detected
J = the reported value is and estimated concentration
R = the compound was rejected

Notes:

1. The lowest value for either the New York Class GA Groundwater Standards (TOGS 1.1.1, June 1998, et al.) or the EPA Maximum Contaminant Limit (MCL), source http://www.epa.gov/safewater/mcl.html#inorganic.html is used. A blank cell indicates no criteria value available.

2.Data validation qualifier.

[empty cell] = data is not qualified
U = compound not detected at concentration listed
J = the reported value is an estimated concentration
R = the result was rejected due to QA/QC considerations
UJ = detection limit is estimated.

3. Shading indicates a concentration above the identified criteria value.

Notes:

1. The lowest value for either the New York Class GA Groundwater Standards (TOGS 1.1.1, June 1998, et al.) or the EPA Maximum Contaminant Limit (MCL), source http://www.epa.gov/safewater/mcl.html#inorganic.html is used. A blank cell indicates no criteria value available.

2.Data validation qualifier.
[empty cell] = data is not qualified
U = compound not detected at concentration listed
J = the reported value is an estimated concentration
R = the result was rejected due to QA/QC considerations
UJ = detection limit is estimated.

3. Shading indicates a concentration above the identified criteria value.

Notes:

1. The lowest value for either the New York Class GA Groundwater Standards (TOGS 1.1.1, June 1998, et al.) or the EPA Maximum Contaminant Limit (MCL), source http://www.epa.gov/safewater/mcl.html#inorganic.html is used. A blank cell indicates no criteria value available.

2.Data validation qualifier.
[empty cell] = data is not qualified
U = compound not detected at concentration listed
J = the reported value is an estimated concentration
R = the result was rejected due to QA/QC considerations
UJ = detection limit is estimated.

3. Shading indicates a concentration above the identified criteria value.

Notes:

1. The lowest value for either the New York Class GA Groundwater Standards (TOGS 1.1.1, June 1998, et al.) or the EPA Maximum Contaminant Limit (MCL), source http://www.epa.gov/safewater/mcl.html#inorganic.html is used. A blank cell indicates no criteria value available.
2. Data validation qualifier.
   [empty cell] = data is not qualified
   U = compound not detected at concentration listed
   J = the reported value is an estimated concentration
   R = the result was rejected due to QA/QC considerations
   UJ = detection limit is estimated.
3. Shading indicates a concentration above the identified criteria value.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Job ID: 680-85871-1

Laboratory: TestAmerica Savannah

Narrative

CASE NARRATIVE

Client: Parsons Corporation

Project: SEAD-16/17 Long Term Monitoring

Report Number: 680-85871-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 12/18/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.4 C.

DISSOLVED METALS (ICPMS)

Samples 16LM20028F (680-85871-13), 16LM20029F (680-85871-14), 16LM20030F (680-85871-15), 16LM20031F (680-85871-16), 16LM20032F (680-85871-17), 16LM20033F (680-85871-18), 16LM20034F (680-85871-19), 17LM20020F (680-85871-20), 17LM20021F (680-85871-21), 17LM20022F (680-85871-22), 17LM20023F (680-85871-23) and 17LM20024F (680-85871-24) were analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 12/21/2012 and analyzed on 12/22/2012, 12/25/2012 and 12/27/2012.

Sodium failed the recovery criteria high for the MSD of sample 680-85852-1 in batch 680-260984.

Calcium failed the recovery criteria low for the MS of sample 16LM20033FMS (680-85871-18) in batch 680-261296.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICPMS)

Samples 16LM20028U (680-85871-1), 16LM20029U (680-85871-2), 16LM20030U (680-85871-3), 16LM20031U (680-85871-4), 16LM20032U (680-85871-5), 16LM20033U (680-85871-6), 16LM20034U (680-85871-7), 17LM20020U (680-85871-8), 17LM20021U (680-85871-9), 17LM20022U (680-85871-10), 17LM20023U (680-85871-11) and 17LM20024U (680-85871-12) were analyzed for total metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 12/22/2012 and analyzed on 12/25/2012 and 12/26/2012.

Copper was detected in method blank MB 680-260764/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL

Job ID: 680-85871-1 (Continued)

Laboratory: TestAmerica Savannah (Continued)

and/or RL, the result has been “B” flagged. Refer to the QC report for details.

Calcium and Magnesium failed the recovery criteria high for the MS of sample 16LM20033UMS (680-85871-6) in batch 680-261166.

Calcium failed the recovery criteria high for the MSD of sample 16LM20033UMSD (680-85871-6) in batch 680-261166.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY (CVAA)

Samples 16LM20028F (680-85871-13), 16LM20029F (680-85871-14), 16LM20030F (680-85871-15), 16LM20031F (680-85871-16), 16LM20032F (680-85871-17), 16LM20033F (680-85871-18), 16LM20034F (680-85871-19), 17LM20020F (680-85871-20), 17LM20021F (680-85871-21), 17LM20022F (680-85871-22), 17LM20023F (680-85871-23) and 17LM20024F (680-85871-24) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 12/24/2012 and 12/28/2012 and analyzed on 12/24/2012 and 12/30/2012.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples 16LM20028U (680-85871-1), 16LM20029U (680-85871-2), 16LM20030U (680-85871-3), 16LM20031U (680-85871-4), 16LM20032U (680-85871-5), 16LM20033U (680-85871-6), 16LM20034U (680-85871-7), 17LM20020U (680-85871-8), 17LM20021U (680-85871-9), 17LM20022U (680-85871-10), 17LM20023U (680-85871-11) and 17LM20024U (680-85871-12) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 12/28/2012 and analyzed on 12/30/2012.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

Qualifiers

Metals

Qualifier	Qualifier Description
U	Undetected at the Limit of Detection.
J	Estimated: The analyte was positively identified; the quantitation is an estimation
J	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDA	Minimum detectable activity
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Creator: Conner, Keaton

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

CASE NARRATIVE

Client: Parsons Corporation

Project: SEAD-16/17 Long Term Monitoring

Report Number: 680-85871-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 12/18/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.4 C.

DISSOLVED METALS (ICPMS)

Samples 16LM20028F (680-85871-13), 16LM20029F (680-85871-14), 16LM20030F (680-85871-15), 16LM20031F (680-85871-16), 16LM20032F (680-85871-17), 16LM20033F (680-85871-18), 16LM20034F (680-85871-19), 17LM20020F (680-85871-20), 17LM20021F (680-85871-21), 17LM20022F (680-85871-22), 17LM20023F (680-85871-23) and 17LM20024F (680-85871-24) were analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 12/21/2012 and analyzed on 12/22/2012, 12/25/2012 and 12/27/2012.

Sodium failed the recovery criteria high for the MSD of sample 680-85852-1 in batch 680-260984.

Calcium failed the recovery criteria low for the MS of sample 16LM20033FMS (680-85871-18) in batch 680-261296.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

TOTAL METALS (ICPMS)

Samples 16LM20028U (680-85871-1), 16LM20029U (680-85871-2), 16LM20030U (680-85871-3), 16LM20031U (680-85871-4), 16LM20032U (680-85871-5), 16LM20033U (680-85871-6), 16LM20034U (680-85871-7), 17LM20020U (680-85871-8), 17LM20021U (680-85871-9), 17LM20022U (680-85871-10), 17LM20023U (680-85871-11) and 17LM20024U (680-85871-12) were analyzed for total metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 12/22/2012 and analyzed on 12/25/2012 and 12/26/2012.

Copper was detected in method blank MB 680-260764/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged “J”. If the associated sample reported a result above the MDL and/or RL, the result has been “B” flagged. Refer to the QC report for details.

Calcium and Magnesium failed the recovery criteria high for the MS of sample 16LM20033UMS (680-85871-6) in batch 680-261166.

Calcium failed the recovery criteria high for the MSD of sample 16LM20033UMSD (680-85871-6) in batch 680-261166.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

No other difficulties were encountered during the metals analyses.

All other quality control parameters were within the acceptance limits.

DISSOLVED MERCURY (CVAA)

Samples 16LM20028F (680-85871-13), 16LM20029F (680-85871-14), 16LM20030F (680-85871-15), 16LM20031F (680-85871-16), 16LM20032F (680-85871-17), 16LM20033F (680-85871-18), 16LM20034F (680-85871-19), 17LM20020F (680-85871-20), 17LM20021F (680-85871-21), 17LM20022F (680-85871-22), 17LM20023F (680-85871-23) and 17LM20024F (680-85871-24) were analyzed for dissolved mercury (CVAA) in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 12/24/2012 and 12/28/2012 and analyzed on 12/24/2012 and 12/30/2012.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

TOTAL MERCURY

Samples 16LM20028U (680-85871-1), 16LM20029U (680-85871-2), 16LM20030U (680-85871-3), 16LM20031U (680-85871-4), 16LM20032U (680-85871-5), 16LM20033U (680-85871-6), 16LM20034U (680-85871-7), 17LM20020U (680-85871-8), 17LM20021U (680-85871-9), 17LM20022U (680-85871-10), 17LM20023U (680-85871-11) and 17LM20024U (680-85871-12) were analyzed for total mercury in accordance with EPA SW-846 Methods 7470A. The samples were prepared on 12/28/2012 and analyzed on 12/30/2012.

No difficulties were encountered during the mercury analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: Parsons Corporation Job Number: 680-85871-1

Lab Section	Qualifier	Description
Metals		
	J	Estimated: The analyte was positively identified; the quantitation is an estimation
	J	Estimated: The quantitation is an estimation due to discrepancies in meeting certain analyte-specific quality control criteria.
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	D	The reported value is from a dilution.
	U	Undetected at the Limit of Detection.
