**SUBJECT: Seneca Army Depot Activity – Final Status Survey of the Radiological Survey Sites (NRC License Termination)**

---

Dear Mr. Greene:

Parsons is pleased to submit this data report summarizing the preliminary analysis of the radiological surveys completed in support of the Final Status Survey (FSS) of the Radiological Survey Sites for the Termination of Nuclear Regulatory Commission (NRC) licenses at the Seneca Army Depot Activity (SEDA) in Romulus, New York. This work was performed in accordance with the Scope of Work (SOW) for Delivery Order 31 to the Parsons Contract DACA87-95-D-0031.

A FSS was performed in accordance with the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM) (NRC, 2000). The FSS is required in order for SEDA to successfully terminate the following NRC licenses:

- a) NRC Docket No. 040-08526;
- a) License SUC-1380, Possession and Storage of depleted uranium as 25 mm, 105 mm, and 120 mm cartridge penetrators. These were issued to the U.S. Army, Operations Support Command (OSC);
- b) Permit 45-16023-01NA, 20 mm and 25 mm cartridges issued to the US Navy;
- c) License SUB-834 held by the U.S. Army Combat Systems Test Activity for 7.62 mm and 0.50 caliber cartridges;
- d) License BML 12-00722-07, possession of promethium 147 in the light anti-tank rocket system; and
- e) STC-133, to store Columbite and tantalum (thorium) ore, managed by Defense Logistic Agency.

The work presented in this data report has been performed as part of the United States Army Corps of Engineers (USACOE) remedial response activities under CERCLA. The survey follows the requirements from the SEDA License Termination and License Release Plan (ANL, Jan 2002)

The entirety of Building S-2084 and Building 2073 were designated as Class II survey areas. No areas were classified as Class I survey units.

Several types of radioactive materials were licensed by the NRC for receipt, storage, and maintenance at SEDA. The primary radionuclides of concern (ROCs) addressed for the FSS for the NRC license termination were the components of depleted uranium (DU), which are: U-234, U-235, and U-238. The secondary ROCs (i.e., of concern in a limited number of survey units) were Pm-147, Ra-226, Pu-239, and H-3.

### **FSS Survey Results**

The surveys to support the NRC License Termination were conducted from June 2002 to September 2002. Alpha, beta, and gamma radiation measurements and exposure rate readings were collected using appropriate instrumentation and following the methods described in the NRC License Termination Sites Final Status Survey Workplan (Parsons, May 2002). The measurement results were tabulated and are presented as **Appendices A through D**. **Appendix A** presents the results of the alpha and beta radiation survey measurements collected in the buildings; **Appendix B** presents the results of the gamma radiation survey measurements collected in the buildings; **Appendix C** presents the results of exposure rate survey measurements and the survey unit descriptions in the buildings; and **Appendix D** presents the results of the alpha, beta, gamma, and exposure rate surveys and the survey unit descriptions in the igloos.

The locations of measurements collected in the igloos were standardized and are illustrated in **Figure 1**. The summary statistics and Wilcoxon Rank Sum (WRS) test results of the igloo survey units (organized by igloo block and survey instrument) are presented in **Table 2** through **Table 6**. A summary of the alpha, beta, and gamma scanning measurements for the igloos is presented in **Table 7**. Summary statistics of the igloo survey units that were determined to be elevated above background based on the WRS test are presented in **Table 8**.

The summary statistics and WRS test results of the building survey units (organized by building and survey instrument) are presented in **Table 9** through **Table 12**. A summary of the alpha, beta, and gamma scanning measurements for the buildings is presented in **Table 13**. Summary statistics of the building survey units that were determined to be elevated above background based on the WRS test are presented in **Table 14**.

The summary statistics for the background survey units are presented in **Table 15**. Building background measurements were collected from Building 722. The survey was performed on an assortment of building materials so the variability in measurements results due to material type was taken into account. One igloo from each igloo block that was not a site igloo was surveyed as a background igloo and the measurement results were combined into one dataset. The measurements were collected at different times of the day with the intent of representing some of the variability in background due to the time of day, instrument fluctuation, and weather conditions.

## **Radon**

During the License Termination surveys, potentially elevated (i.e., above flag values) alpha radiation levels were measured at the rear air vents within the igloos (location 29 on **Figure 1**). The alpha, beta, and gamma measurement results from the air vent location within each igloo are listed in **Table 16**; the locations that are above the flag values are highlighted. At the air vent measurement location, 102 of the 120 site igloos (including 4 of the 5 background igloos) exceeded the alpha flag value of 9 counts per minute (cpm). Deposition of radioactive progeny due to radon emanation was thought to be the source of these elevated alpha measurements based on the following observations:

- While airflow within the igloos was limited, it was observed that air tended to move from the rear air vent toward the floor drains at the fronts of the igloos. It is likely that naturally-occurring radon emanations from the approximately 12 feet of soil below the air vent are drawn into the igloo by this air movement.
- Field analysis of smear samples taken at the vent screens indicated that the elevated measurements were due to removable material, suggesting deposition. Visibly cleaner-looking vent screens had lower alpha radiation measurements.
- The air vents were approximately 12 feet above the floor. Given the activities within the igloos it is unlikely that 1) dispersible or airborne material was present at any time, and 2) any potential residual contamination would have a means of reaching the air vents.

In order to determine the presence of radon within the igloos, the following three-tiered approach was used and is discussed below:

- 1) Calculation of the alpha/beta ratios of the direct measurements at the air vent and comparison to the theoretical alpha/beta ratio for radon progeny;
- 2) Direct radon testing using E-Perm chambers in 10% of the igloos; and
- 3) In-situ gamma spectroscopy measurements.

Direct alpha and beta phoswich measurements from the rear air vents were converted from counts per minute (cpm) to decays per minute (dpm) for each igloo and an alpha-to-beta ratio was calculated (refer to **Table 16**). These measured ratios were compared to a theoretical ratio based on the expected yields of alpha and beta radon progeny. While the ratio comparison was inconclusive for many of the igloos, several of the igloos with the highest alpha measurements had measured alpha/beta ratios that agreed with the theoretical alpha/beta ratio of 0.33.

Direct radon testing using E-Perm chambers was performed in 10% of the site igloos (12 total, plus 4 duplicates). In addition, radon testing was performed in the five background igloos (plus one duplicate). Detected radon concentrations ranged from 2.1 to 8.4 pCi/L in the site igloos, and from 1.8 to 9.3 pCi/L in the background igloos. The results and distributions of detected radon concentrations for both the site and background igloos are presented in **Figure 2**. Radon concentrations in both site and background igloos were above the EPA standard residential

guideline of 4 pCi/L (used only for comparative purposes), suggesting that the elevated alpha measurements are from naturally high radon levels.

In-situ gamma spectroscopy was performed at the five locations with the highest alpha measurements. The radionuclides that were identified in the five locations included Ra-226, Pb-214 and Pb-210, which are all naturally-occurring progeny of the uranium decay series (Pb-214 and Pb-210 are direct progeny of radon). It is unlikely that these progeny would be present in identifiable quantities in residual DU contamination because the process that generates enriched or depleted uranium removes any impurities that may be present (including progeny), and the ingrowth of significant amounts of progeny takes several thousand years. The positive identification of these radionuclides at the air vents strongly suggests that the elevated alpha measurements are the result of radon progeny deposition and not of residual DU contamination.

### **Analysis of Survey Results**

The preliminary statistical evaluation of the radiological survey data included calculations of the minimum, maximum, mean, median, and standard deviation. Additionally, the Wilcoxon Rank Sum (WRS) test was used to compare survey unit data and background data, following MARSSIM guidance. If the WRS test results indicate that the survey unit site data are statistically elevated above background, additional statistical analyses will be performed to demonstrate compliance with the release criteria. The additional analyses will include a comparison of the site survey unit data with a DCGL-adjusted background data set.

The results from the WRS statistical tests for the igloos are summarized in **Table 17**. The alpha, beta, and gamma survey measurements for 83 of the 120 igloos were determined to be indistinguishable from background, and no additional analysis is necessary for these igloos. Of the 37 igloos that had elevated data sets, there were 7 elevated alpha data sets, 5 elevated beta data sets, and 27 elevated gamma data sets (the numbers of alpha, beta, and gamma add up to more than 37 because two igloos had more than one elevated data set).

Per USEPA (2000) guidance, the conclusions from statistical tests such as the WRS test should be confirmed (i.e., reality checked) by reviewing graphical (e.g., box-and-whisker) plots. Box-and-whisker plots for all of the igloo data sets that were determined to be elevated above background using WRS statistics are presented in **Figure 3** through **Figure 7**. A review of the box-and-whisker plots for several of the elevated data sets indicates that although the WRS test results suggest that survey unit and background measurements are different, the survey unit data appears to be more indicative of a subset of background measurements than of residual contamination. Of the seven elevated alpha data sets, six had measurements that were entirely within the range of background alpha measurements; there was only one igloo (E0602) that exceeded the background alpha radiation range. All five of the elevated beta data sets were entirely within the range of background beta measurements. For the elevated gamma measurements, the shape of the box-and-whisker plot is consistent for almost all 27 data sets, with the majority of the site measurements occurring around the 75% of the background data set. However, only six of the 27 elevated gamma data sets have measurements that exceed the distribution of measurements in the background data set. While the shapes and magnitudes of the box-and-whisker plots for these six

gamma data sets also suggest that they may also be part of background, these data sets are conservatively retained for further analysis. Based on the box-and-whisker plot analysis, the alpha data set from E0602 and the gamma data sets from A0508, A0706, B0909, D0406, D0604, and E0103 will be compared to the DCGL-adjusted background data sets.

The results from the WRS statistical tests for the buildings are summarized in **Table 18**. The alpha, beta, and gamma survey measurements for 28 of the 33 building survey units were determined to be indistinguishable from background, and no additional analysis is necessary for these survey units. All five of the elevated data sets consisted of alpha measurements using a floor monitor. The box-and-whisker plots for these five data sets are presented in **Figure 8**. The measurements for all five survey unit data sets consistently exceed the range of the floor monitor background alpha data set. It should be noted that the floor monitor background data set consists of only 15 measurements, and therefore may not be representative of the material types found in the buildings surveyed during the License Termination. However, the five elevated alpha floor monitor data sets (2073 Room 3, 2084 Room 3, 306 Room 10, 306 Room 11, and 306 Room 13) will be compared to the DCGL-adjusted background data set.

The igloo or survey unit data sets that were demonstrated to be elevated above background will be compared to DCGL-adjusted background data sets. The DCGLs are currently undergoing revision based on NRC comments to the SEDA License Termination and License Release Plan (ANL, Jan 2002).

Scanning results (presented for the igloos in **Table 7** and for the buildings in **Table 13**) did not indicate the presence of any hotspot contamination. There were no exceedances of the scanning flag values for any of the scanning measurements.

### **Additional Work Performed**

To further support conclusions for the FSS, in-situ gamma spectroscopy measurements using the Universal Radiation Spectrum Analyzer (**URSA**) were collected at the highest measurement locations in the igloos and buildings. The URSA analysis results are not presented in this letter report, but will be included in the FSS report. An analysis of the material sample analytical results will also be presented in the FSS report. In addition, the FSS report will include a detailed radon analysis to support the findings and conclusions of the radon investigation.

### **Preliminary Conclusions**

Based on the analysis of data collected for the NRC License Termination, the following preliminary conclusions are drawn:

- The following data sets are considered to be potentially elevated, and will be compared to a DCGL-adjusted background data set:
  - E0602 alpha measurements
  - A0508 gamma measurements
  - A0706 gamma measurements
  - B0909 gamma measurements

- D0406 gamma measurements
- D0604 gamma measurements
- E0103 gamma measurements
- 2073 Room 3 alpha floor monitor measurements
- 2084 Room 3 alpha floor monitor measurements
- 306 Room 10 alpha floor monitor measurements
- 306 Room 11 alpha floor monitor measurements
- 306 Room 13 alpha floor monitor measurements
- The alpha, beta, and gamma measurement data sets from all other igloos and building survey units were determined to be within background based on results of the WRS test and/or graphical analyses.
- Potentially elevated alpha measurements at the air vents within the igloos were determined to be the result of radon progeny deposition on the vent screens, and not of residual DU contamination.
- Scanning measurements did not indicate the presence of any hotspots.

Final conclusions for the License Termination sites will be made upon completion of the FSS for these sites. Data and conclusions from the License Termination sites will be evaluated with the other radiological sites at SEDA to support the termination of all radiological licenses held with the NRC by SEDA.

Parsons appreciates the opportunity to provide you with this data report. Should you have any questions regarding the information presented in this report, please do not hesitate to call me at (781) 401-2229 to discuss them.

Sincerely,

Todd Heino, P.E.  
Program Manager

Notes:

- a) Unless otherwise noted, igloos were used for storage of packaged DU ammunition under NRC license SUC-1275.
- b) The list of igloos requiring surveying under the SEDA NRC License Termination program was compiled from *Seneca Army Depot- License Termination and License Release Plan*, ANL, January 2002.
- c) Igloo A0701 was used for the storage of light anti-tank rockets that contained Promethium-147 under license BML 12-00722-07.

**CLASSIFICATION AND JUSTIFICATION OF IGLOOS AND BUILDINGS<sup>a</sup>**  
**NRC LICENSE TERMINATION SURVEYS**  
**SENECA ARMY DEPOT ACTIVITY**

Building/Igloo	Operations Performed	Summary of Past Radiological Surveys	Radionuclides of Concern	Affected Licenses	Classification
Building 5	Staging Point to prepare DU ammunitions for shipment	During operations, periodic surveys were conducted and no elevated levels of radioactivity were ever detected. The last of the DU ammunition was shipped off-site in September, 1999.	U-234, U-235, U-238 (DU)	SUC-1275; SUC-1380	Class II/ Class III
Building 306					Class II/ Class III
Building S-2084					Class II
Building 2073					Class II
Igloo A0701	Stored anti-tank rocket systems that contained Pm-147	N/A	Pm-147	SUC-1275; BML 12-00722-07 (managed by TACOM Rock Island)	Class III
Igloos E0801 & E0802	Stored barrels of pitchblende ore	Several surveys performed. Igloos release for unrestricted use in 1985.	Ra-226, U-234, U-235, U-238 (pitchblende ore)	SUC-1275; SUC-1380	Class III
Igloos A0201, A0316, A0317, A0508	Stored special weapons	Were surveyed in 1992 and 1993 and released for unrestricted use.	Pu-239, U-234, U-235, U-238, and H-3	SUC-1275; SUC-1380	Class III
Ammunition Bunkers (See Table 1B)	Stored packaged DU ammunition	During operations, periodic surveys were conducted and no elevated levels of radioactivity were ever detected. The last of the DU ammunition was shipped off-site in September, 1999.	U-234, U-235, U-238 (DU)	SUC-1275; SUC-1380	Class III
Warehouse 356 <sup>b</sup>	Stored Columbite and Tantalum (thorium) ore	NRC released building for unrestricted use in Amendment 16 to SUC-133 in December 1994.	Natural Thorium	SUC-1275; STC-133 (managed by Defense Logistic Agency)	Class III
Building 612 <sup>c</sup>	Unpackaged, inspected, and repackaged DU ammunition.	Building was surveyed in 1999.	U-234, U-235, U-238 (DU)	SUC-1275; SUC-1380	Class I

a) This table is adapted from Table 2-2 of the *Seneca Army Depot Activity- License Termination and License Release Plan*, Argonne National Laboratories.

b) Warehouse 356 is no longer included in the NRC License Termination as it has already been release by the NRC.

c) Building 612, since it has already been surveyed, will not be part of this radiological survey.

<sup>a/</sup> cpm = Counts per minute.

<sup>b/</sup> If the p-level is less than the alpha (type I) error of 0.05, the survey and background data sets are not considered to be part of the same population and the WRS test is said to fail. Box-and-whisker plots are generated (refer to the appendices for box-and-whisker plots) and compared in order to determine if the survey data is elevated above the background data.

<sup>a/</sup> cpm = Counts per minute.

<sup>b/</sup> If the p-level is less than the alpha (type I) error of 0.05, the survey and background data sets are not considered to be part of the same population and the WRS test is said to fail. Box-and-whisker plots are generated (refer to the appendices for box-and-whisker plots) and compared in order to determine if the survey data is elevated above the background data.

<sup>a/</sup> cpm = Counts per minute.

<sup>b/</sup> If the p-level is less than the alpha (type I) error of 0.05, the survey and background data sets are not considered to be part of the same population and the WRS test is said to fail. Box-and-whisker plots are generated (refer to the appendices for box-and-whisker plots) and compared in order to determine if the survey data is elevated above the background data.

<sup>a/</sup> cpm = Counts per minute.

<sup>b/</sup> The scanning flag values for measurements in Class II survey units are based on the gross activity DCGL for depleted uranium (Table 3.3 - Parsons 2002). The scanning flag values for measurements in Class III survey units are based on the 95% upper threshold limit of the Building 722 background data set (Table 3.4 - Parsons, 2002).

<sup>a/</sup> cpm = Counts per minute.

<sup>b/</sup> If the p-level is less than the alpha (type I) error of 0.05, the survey and background data sets are not considered to be part of the same population and the WRS test is said to fail. Box-and-whisker plots are generated (refer to the appendices for box-and-whisker plots) and compared in order to determine if the survey data is elevated above the background data.

<sup>a/</sup> cpm = Counts per minute.

<sup>b/</sup> If the p-level is less than the alpha (type I) error of 0.05, the survey and background data sets are not considered to be part of the same population and the WRS test is said to fail. Box-and-whisker plots are generated (refer to the appendices for box-and-whisker plots) and compared in order to determine if the survey data is elevated above the background data.

<sup>c/</sup> FM = Floor monitor.

<sup>d/</sup> NA = Not applicable. A minimum of five measurements is necessary for the WRS test. When this criterion is not met, the maximum survey result is compared to the maximum background result for that instrument.

<sup>a/</sup> cpm = Counts per minute.

<sup>b/</sup> The scanning flag values for measurements in Class II survey units are based on the gross activity DCGL for depleted uranium (Table 3.3 - Parsons 2002). The scanning flag values for measurements in Class III survey units are based on the 95% upper threshold limit of the Building 722 background data set (Table 3.4 - Parsons, 2002).

**TABLE 14**

<sup>a/</sup> cpm = Counts per minute.

<sup>b/</sup> If the p-level is less than the alpha (type I) error of 0.05, the survey and background data sets are not considered to be part of the same population and the WRS test is said to fail. Box-and-whisker plots are generated (refer to the appendices for box-and-whisker plots) and compared in order to determine if the survey data is elevated above the background data.

<sup>c/</sup> FM = Floor monitor.

<sup>a</sup> Background igloo

<sup>b</sup> cpm = Counts per minute.

<sup>c</sup> A phoswich was used for the alpha/beta measurements and a FIDLER was used for the gamma measurements.

For details on instrument serial numbers and measurement collection dates, refer to Appendix D.

<sup>d</sup> dpm = Decays per minute. Alpha and beta measurements in cpm were converted to dpm using the average daily efficiency of the phoswich detector.

<sup>e</sup> Rows that are bolded and shaded indicate that the alpha direct measurement exceeded the field flag value of 9 cpm.

Total No. of igloos survey units: 120
Total No. of igloo survey units not elevated above background based on WRS: 83
Total No. of igloo survey units not elevated above background based on WRS and box-and- whisker plots: 113
% of igloos below background: 94%
37 of 37 igloos passed

Notes:

- 1.) Igloos where WRS test results ("NO") or graphical analysis ("NO\*") indicate that the survey unit is not elevated above background need no further statistical analysis. Therefore, the cells for those igloos are shaded in the "elevated above background + DCGL?" column.
- 2.) Blank cells in the "elevated above background + DCGL?" column will be filled in when the WRS analysis can be performed comparing site survey units to the DCGL adjusted background data set.
- 3.) Igloos A0706 and D0604 each had more than one data set for which the WRS test results indicated that site data was elevated above background. Additional graphical analyses of the A0706 alpha data set and the D0604 beta data set indicated that these data were not elevated above background (refer to text).

DEPARTMENT OF THE ARMY  
UNITED STATES ARMY AVIATION AND MISSILE COMMAND  
REDSTONE ARSENAL, ALABAMA 35898-5000

REPLY TO  
ATTENTION OF

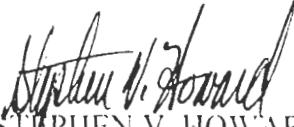

AMSAM-TMD-SR(C)

3 December 2003

MEMORANDUM FOR Commander, Seneca Army Depot Activity, ATTN: SIOSE-S, 5786 State Route 96, Romulus, NY 14541-5001

SUBJECT: Decommissioning Wipe Test Results

1. The results of area wipe tests made at your facility from 7 May to 10 July 2003, which this laboratory received on 9, 23, 27 June, and 4 August 2003, are indicated at Enclosure 1. Limit of Detection (LD) is also included in Enclosure 1. Results exceeding the limit of decision are reported as defined by NCRP 58.
2. Traceability to NIST is provided by an Am-241 source, SN: SS-805, last calibrated date: 29 May 2002, a Sr-90 source, SN SS-810, last calibrated date: 30 May 2002, and a Cs-137 source, SN: SS-799, last calibrated date: 30 May 2002. These sources were calibrated at NIST and were used to calibrate the counters used to evaluate your leak tests. The NIST calibration documents are maintained on file at this facility. *This laboratory is ISO-9002 registered.*
3. The POC is the undersigned, COM 256-876-0472/3340/7666 or DSN 746-0472/3340/7666.

  
STEPHEN V. HOWARD  
Lead Health Physicist, Nuclear Counting  
and Special Projects
