EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

This Completion Removal Report documents the Time Critical Removal Action (TCRA) performed at the SEAD 39 and SEAD 40 Solid Waste Management Units (SWMUs) located at the Seneca Army Depot Activity (SEDA) in Romulus, New York. This work was performed by Weston Solutions, Inc. (WESTON®) under the Rapid Response Contract No. DACA45-98-D-0004; Task Order 0034 for the U.S. Army Corps of Engineers (USACE), Omaha District with support provided by USACE, New York District and SEDA. The TCRA was performed in accordance with the *Final Action Memorandum and Decision Document* (Parsons 2002) and WESTON's *Final Task Work Plan* (July 2003), and included the following tasks:

- Soil Removal - Total petroleum hydrocarbons (TPH) was detected in elevated levels in soil samples during the investigation conducted in 1993 and 1994. Approximately 18.5 cubic yards (yd^3) of impacted soil from SEAD 39 and 17 yd^3 of impacted soil from SEAD 40 were excavated.
- Post-Excavation Confirmation Sampling – Conducted post-excavation confirmatory sampling to verify satisfactory removal of all potential contaminants of concern (COCs). Volatile organic compounds (VOCs) were previously determined as COCs for this TCRA. Due to the nature of the historical discharge of boiler blowdown liquids, soils in the areas may have also been impacted by semivolatile organic compounds (SVOCs) and metals. A total of 16 confirmation samples were collected from 10 locations within SEAD 39 and 47 confirmation samples were collected from 27 locations within SEAD 40. Samples were analyzed for VOCs, selected SVOCs [polynuclear aromatic hydrocarbons (PAHs)], and metals.
- Waste Transportation and Disposal - Waste characterization sampling, transportation and off-site disposal of the excavated material at a licensed waste disposal facility.

As of 20 February 2006, the total project cost incurred for TCRA at SEADs 39 and 40 is \$75,513.17. Based on confirmation sampling results, the major conclusions for each SWMU are summarized as follows:

SEAD 39

- During the TCRA activities conducted at SEAD 39, WESTON removed approximately 18.5 yd^3 of TPH-impacted soil from the former boiler blowdown leach

pit area. The previously identified area of impacted soil measured 20 feet (ft) by 50 ft, and was excavated by WESTON to a depth of 1 ft.

- None of the target VOC parameters were detected above the recommended New York Technical Administrative Guidance Memorandum (NY TAGM) criteria in any of the post-excavation samples collected from SEAD 39.
- The average concentration of PAHs in post-excavation and delineation samples indicates that the concentration of these contaminants has been reduced.
- The sitewide averages for arsenic and silver were slightly above the cleanup criteria, while the mercury value was met.
- Although individual samples for metals and PAHs may exceed one or more NY TAGM goals, the cleanup objectives for VOCs have been met.
- All soils excavated from SEAD 39 were disposed off-site as non-hazardous waste based on the waste characterization sampling results. No Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) or Resource Conservation and Recovery Act (RCRA) regulated material was identified based upon sampling results.
- It is the U.S. Army's (Army) opinion that sample results indicate the original concentration of contaminants is most likely related to industrial activity rather than a release from the boiler blowdown sump.

SEAD 40

- During the TCRA activities conducted at SEAD 40, WESTON removed approximately 17 yd³ of soil from the former boiler blowdown leach pit area. The previously identified area of impacted soil measured 120 ft by 6 ft. The northern portion of the impacted area (110 ft by 6 ft) was excavated to a depth of 1 ft. The remaining southern portion of the impacted area (10 ft by 6 ft) was excavated to a depth of 6 ft.
- One target VOC parameter (methylene chloride) was detected at a concentration of 130 micrograms per kilogram ($\mu\text{g}/\text{Kg}$), which is above the NY TAGM goal of 100 $\mu\text{g}/\text{Kg}$. This exceedance occurred at a depth of 0-6 inches below ground surface (bgs) at sample location FX-SS-004. Additional sampling at this location indicated levels of methylene chloride were not detected at depths exceeding 6 inches bgs. The average concentration of methylene chloride is below the cleanup goal for the site.
- No other VOC parameters were found to exceed the NY TAGM goals at any other post-excavation sampling locations associated with SEAD 40.

- All soils excavated from SEAD 40 were disposed of off-site as non-hazardous material based on the waste characterization sampling results. No CERCLA or RCRA regulated material was identified.
- The average concentration of PAHs in post-excavation and delineation samples indicates the concentration of these contaminants has been reduced and the sitewide average benzo(a)pyrene TEQ is below the recommended cleanup goal. It is noted that many perimeter confirmation samples are located adjacent to a paved parking lot or a railroad track. The residual contamination results indicate they are associated with general industrial activity at the site rather than a defined release.
- Three non-target metals were detected above the cleanup goals in some post-excavation samples. The average concentration is below the cleanup goal for barium and chromium, and slightly above for arsenic. Since none of these metals were contaminants of concern, and the target metal mercury was not detected, the cleanup objective has been met.
- Although individual samples for metals and PAHs may exceed one or more NY TAGM goals, the cleanup objectives for VOCs have been met.
- It is the Army's opinion that sample results indicate the original concentration of contaminants is most likely related to industrial activity rather than a release from the boiler blowdown sump.

Based on the confirmatory sampling data obtained following removal of the TPH-impacted soils from SEADs 39 and 40, the horizontal and vertical extents of elevated levels of VOCs have been satisfactorily delineated in these SWMUs and the recommended cleanup goals for these contaminants has been met. Other potential COCs (SVOCs, and metals) associated with historical discharge of boiler blowdown liquids or other industrial activities were analyzed during the post-excavation confirmation sampling events. The overall remaining levels of PAHs (selected parameters for SVOCs) in soils are considered low. The average concentrations of metals are either below the cleanup goals or consistent with levels found in other non-impacted areas. Consequently, the potential threat to human health and the environment, as previously identified in the *Action Memorandum and Decision Document* (Parsons 2002), has been substantially reduced or eliminated. It is recommended that no further action be considered for these areas.

Final Report
Seneca Army Depot – SEADs 39 and 40
Contract No. DACA45-98-D-0004
Task Order No. 0034

SECTION 1

INTRODUCTION

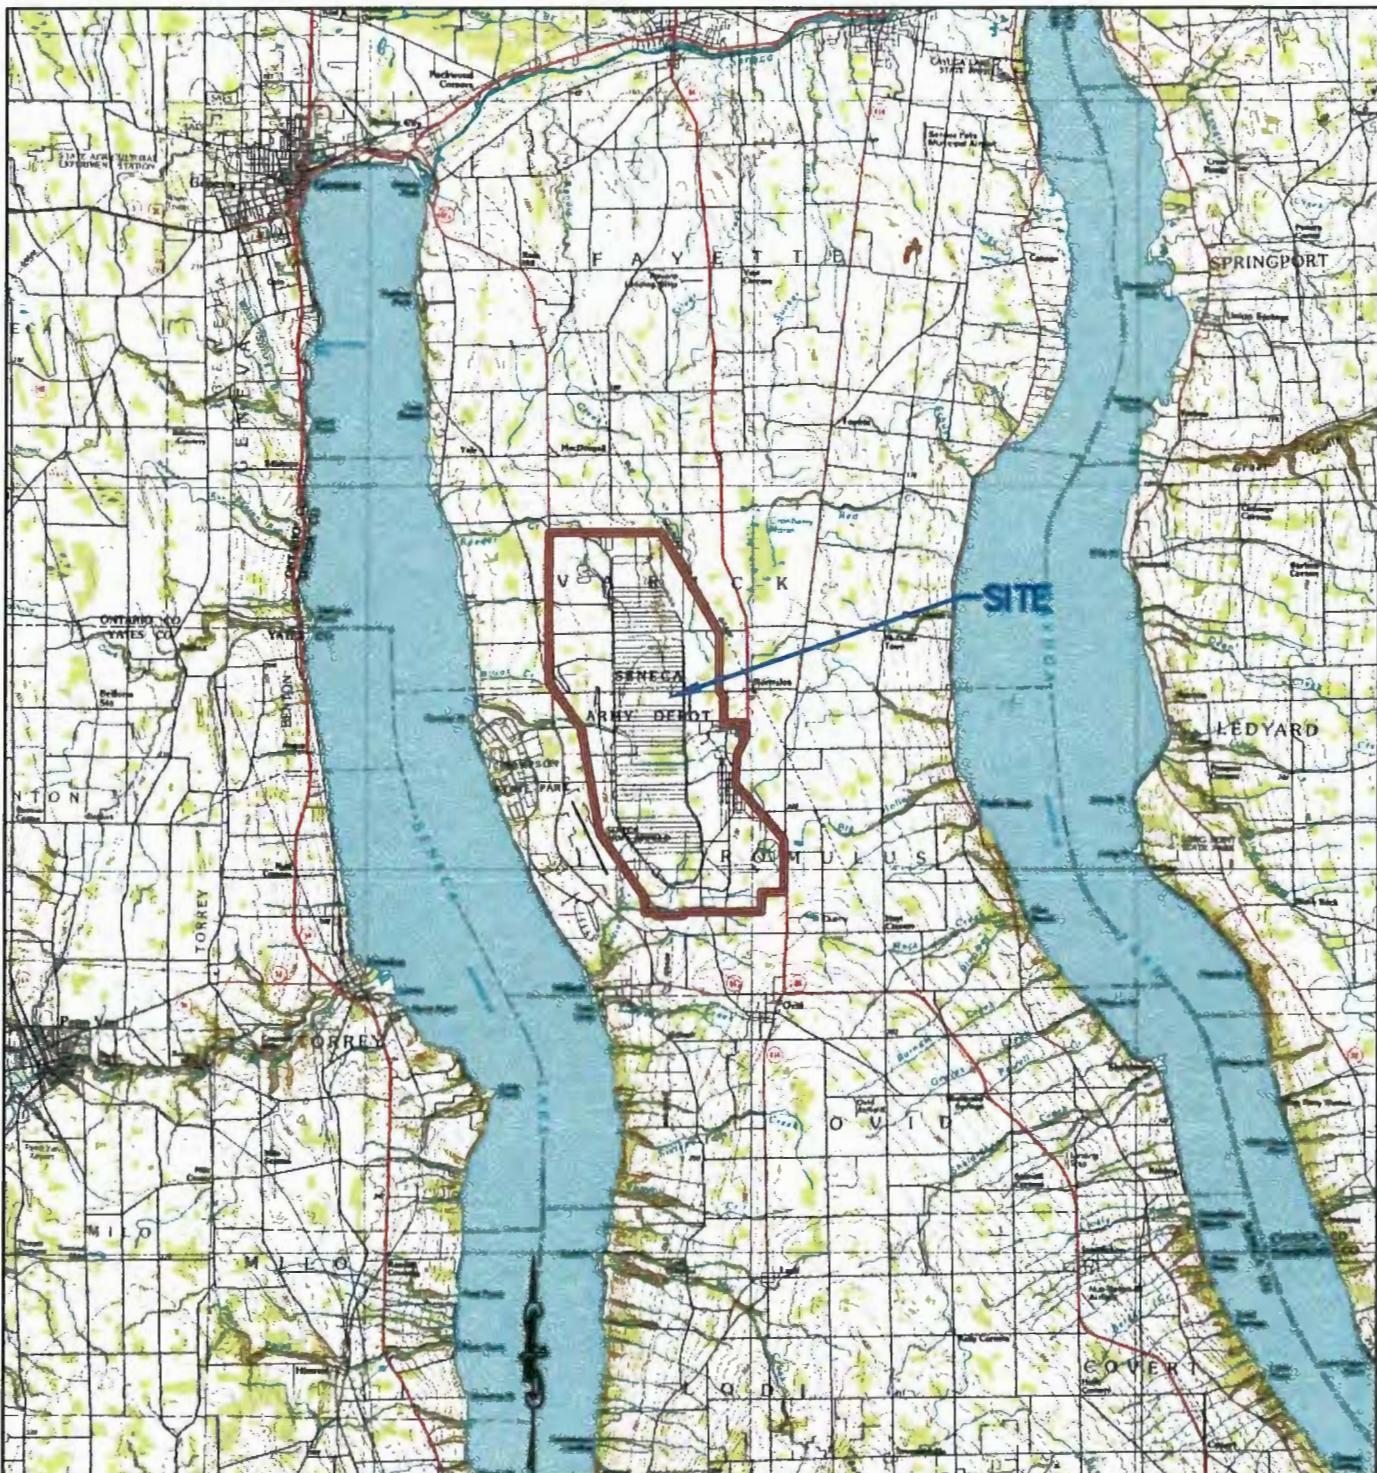

1. INTRODUCTION

This Completion Removal Report documents the Time Critical Removal Action (TCRA) performed at the SEAD 39 and SEAD 40 Solid Waste Management Units (SWMUs) located at the Seneca Army Depot Activity (SEDA) in Romulus, New York. This work was performed by Weston Solutions, Inc. (WESTON®) under the Rapid Response/Immediate Response Contract No. DACA45-98-D-0004, Task Order (TO) 0034 for the U.S. Army Corps of Engineers (USACE), Omaha District with support provided by USACE, New York District and SEDA.

1.1 PROJECT DESCRIPTION

The TCRA for SEADs 39 and 40 was initiated in compliance with Section 11 of the SEDA Federal Facilities Agreement that describes removal actions as viable options for eliminating potential threats. The scoped activities for this TO were conducted in accordance with the *Final Action Memorandum and Decision Document* (Parsons 2002) and WESTON's *Final Task Work Plan* (July 2003) with a goal of minimizing possible threats, current or future, that may exist as a result of elevated levels of total petroleum hydrocarbons (TPH) detected in soils associated with the historical release of the boiler blowdown liquids at these sites.

Due to the limited data available, it is the U.S. Army's (Army's) intention to conduct initial, focused TCRA that limited to the areas potentially impacted by the boiler blowdown liquid discharge and detected with elevated TPH concentration in shallow soils. Following completion of removal action, confirmation samples were collected from the soils remaining at the excavation and analyzed for all potential contaminants of concern (COCs). The analytical data of confirmation sampling were also used to determine if soils impacted with TPH and/or other potential contaminants of concern, such as volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), and metals, have been successfully removed and therefore reduce the potential threats, current or future, to the human health and the environment.

The results of the TCRA presented in this completion report, in conjunction with the Record of Decision, will serve as the basis for providing clean closure for the site (SEADs 39 and 40).

1.2 SITE DESCRIPTION

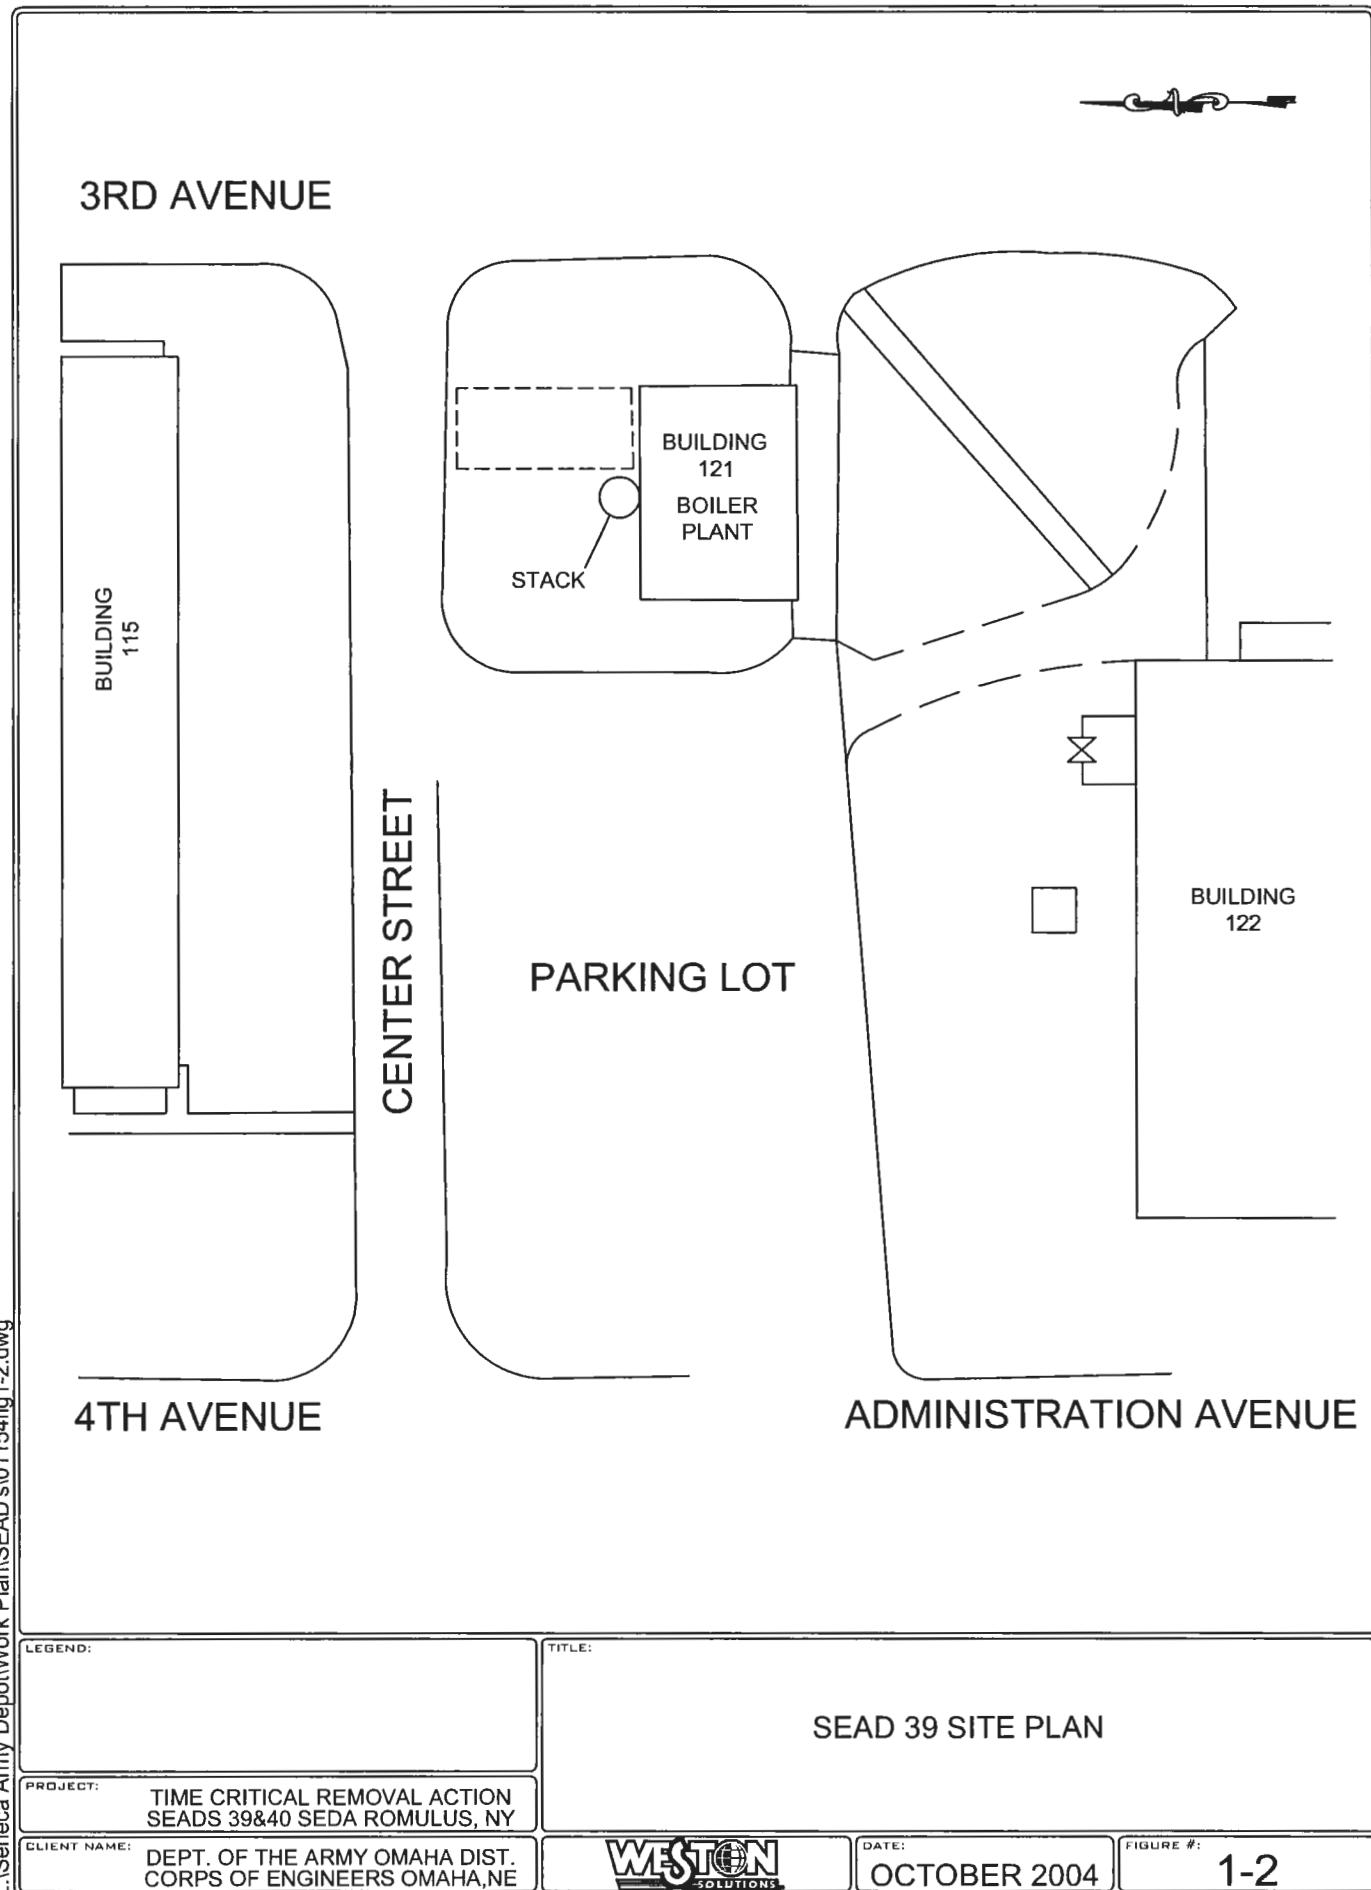

Seneca Army Depot Activity is located in Romulus, Seneca County, New York as shown in Figure 1-1. The facility property, which occupies approximately 10,600 acres, is bounded to the west by State Route 96A and to the east by State Route 96. Geneva and Rochester are located 14 and 50 miles, respectively, to the northwest. Syracuse is 50 miles to the northeast. Ithaca is 31 miles to the south. The area immediately surrounding the site is generally used for agriculture.

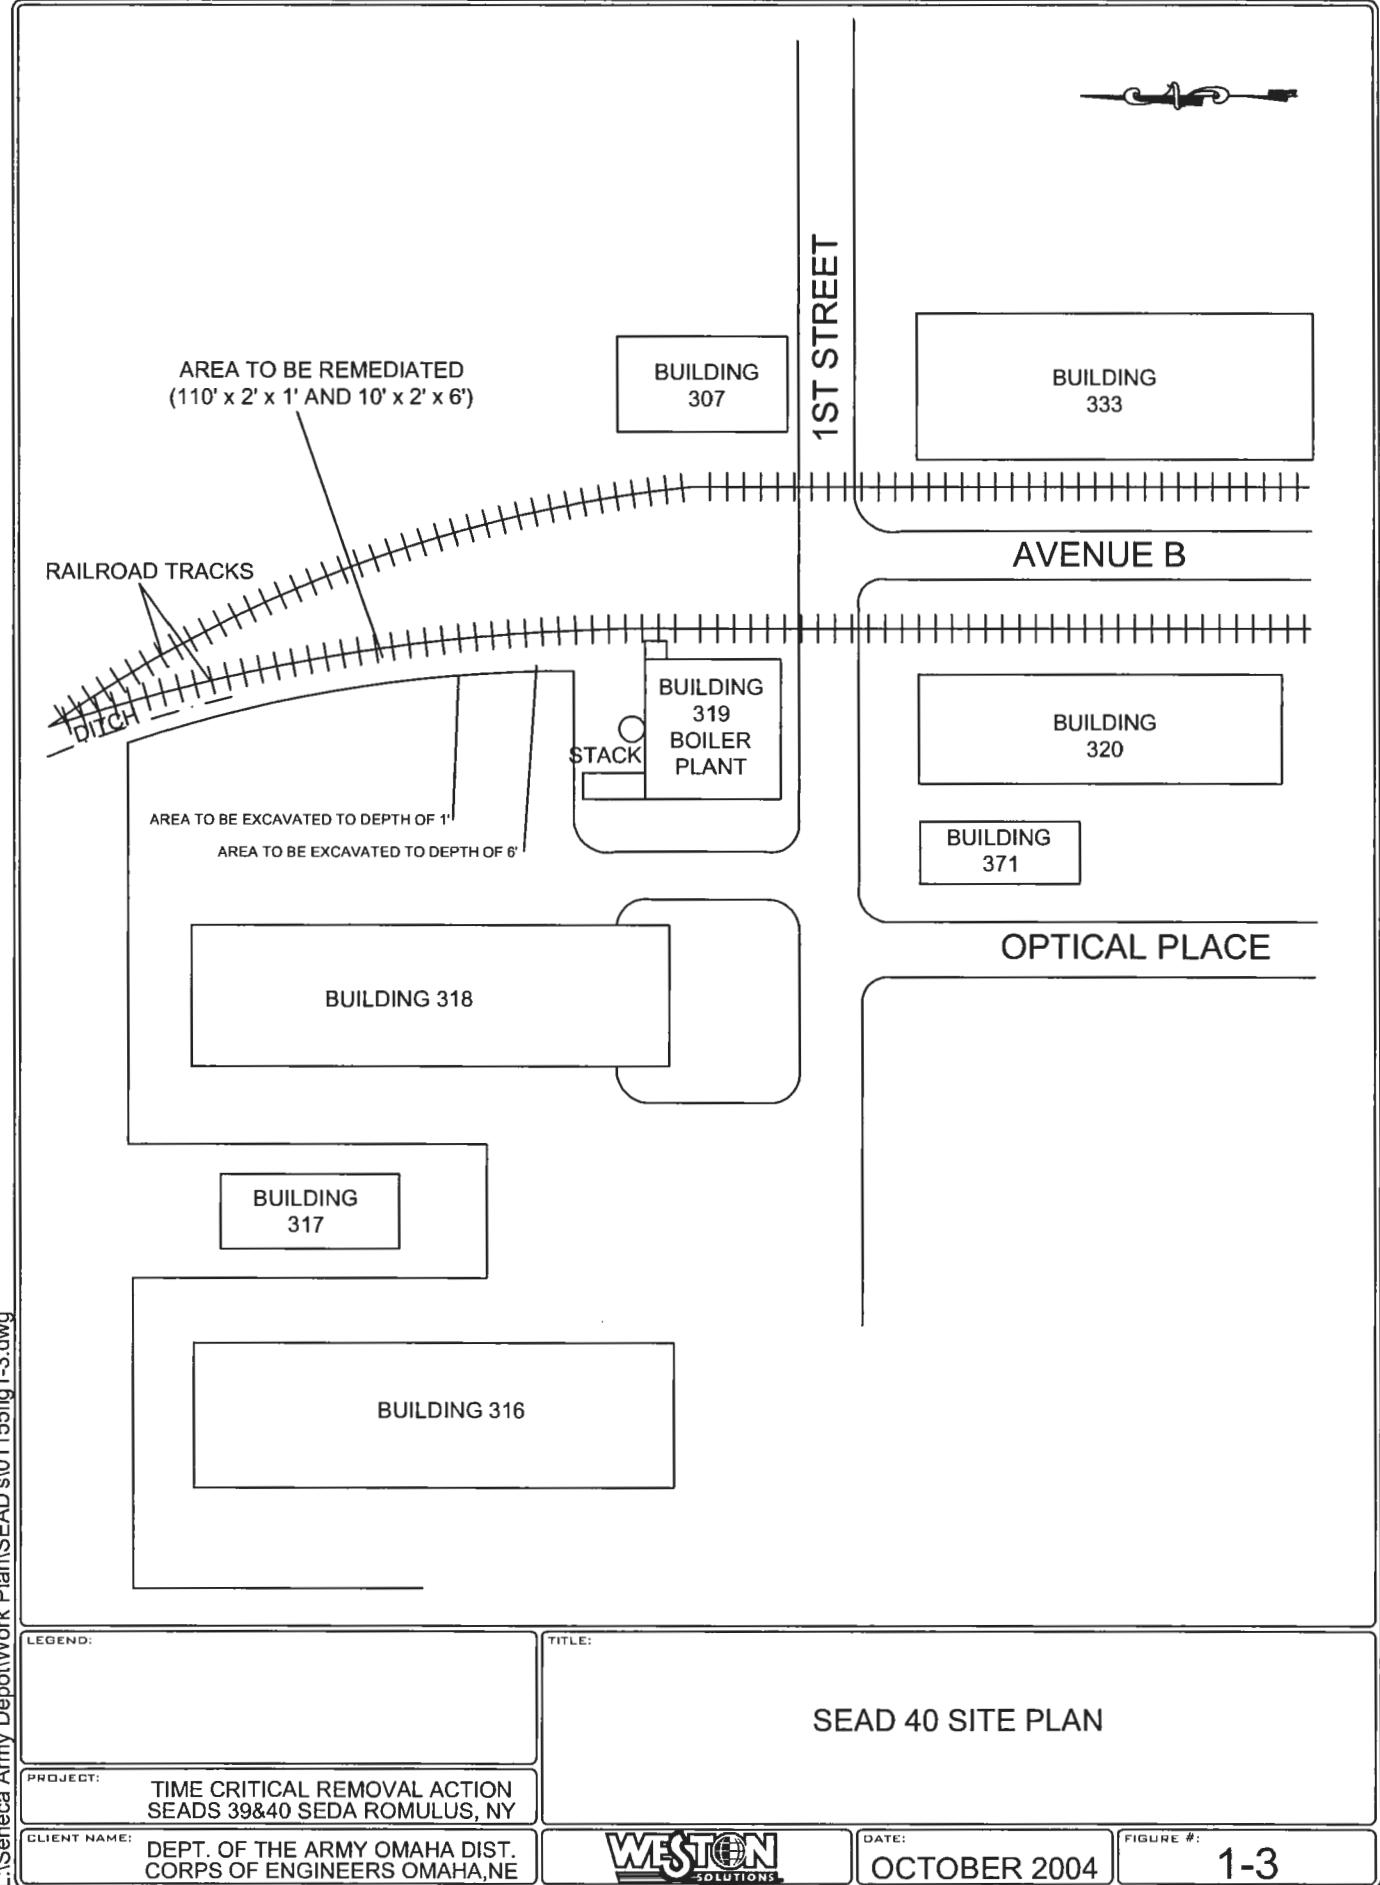

1.2.1 SEAD 39

The former boiler blowdown leach pit known as SEAD 39 is located immediately north of Building 121 (refer to Figure 1-2). Building 121 was an active boiler plant located in the administrative area along the eastern border of SEDA. The historic blowdown area associated with Building 121 is located north of the building, approximately 1,000 feet (ft) south and approximately 800 ft west of the nearest SEDA fence line. The land surface to the north of the building is grass covered and is slightly mounded between the building and the street. Currently the leach pit is not visible as there are no obvious depressions where blowdown has accumulated. Center Street, which runs in an east-west direction, is located 50 ft to the north of Building 121 and the suspected location of the former leach pit.

1.2.2 SEAD 40

The former boiler blowdown leach pit known as SEAD 40 is located north of Building 319 in a drainage ditch adjacent to the railroad tracks (refer to Figure 1-3). Building 319 is a former boiler plant located on 1st Street in the eastern portion of SEDA approximately 2,000 ft west of the nearest SEDA fence line. A drainage pipe originating in Building 319 is suspected to have carried blowdown liquids into the drainage ditch, which originates at the mouth of the pipe approximately 30 ft northeast of Building 319. The drainage ditch continues for approximately

400 ft and eventually levels into a grassy field. The ground surface north of Building 319 and south of the drainage ditch is covered with asphalt and crushed rock. Several warehouses are also located north of Building 319.

1.3 SITE BACKGROUND

Prior to 1979-1980, each boiler discharged approximately 400 to 800 gallons of blowdown liquids per day. The discharged liquid was allowed to flow into the drainage ditches where it infiltrated the ground and/or mixed with other stormwater flow. After 1979 all boiler blowdown points were connected to the sanitary sewer. Limited sampling programs were conducted within each SWMU between 1993 and 1994. Soil samples collected during the 1993-1994 investigation were analyzed for TPH only. VOCs, SVOCs, and metals were not analyzed at that time. Analytical results indicated that TPH concentrations were detected in all of the soil samples collected, with the highest concentrations occurring within the shallow soils associated with each of the SEADs (Parsons 2002). These TPH results suggest that organic constituents have been released, and are persistent in the environment, as a result of historic operations at these sites. As described in the *Final Action Memorandum and Decision Document* (Parsons 2002), historical operations at these sites included the discharge of boiler blowdown liquids, which presumably impacted the surrounding soils [up to a depth of 6 ft] with TPH, VOCs, SVOCs, and metals.

1.3.1 SEAD 39

Insufficient information exists to determine the exact location where boiler blowdown occurred within SEAD 39. Sample results obtained during the limited sampling program indicated that TPH concentrations were generally less than 100 parts per million (ppm), with the exception of one sample that had a concentration of 118 ppm. Based on these results it was estimated that two 6-inch layers of soil (approximately 18.5 cubic yards (yd^3) each) would require removal from SEAD 39 (Parsons, 2002). The first 6 inches of soil was placed during landscaping following termination of historic blowdown operations in 1980; therefore, it was anticipated that this soil had not been impacted by historic Site operations and could be segregated from the underlying 6 inches of suspected contaminated material.

1.3.2 SEAD 40

Available information for SEAD 40 indicates that a buried pipe carried boiler blowdown liquids from Building 319 to the drainage ditch north of the building (refer to Figure 1-3). Results of the limited sampling program detected a TPH concentration of 1,270 ppm in subsurface soils at the mouth of the former blowdown discharge pipe [6 ft below ground surface (bgs)], and levels in surface soils ranged from a minimum of 300 ppm to a maximum of 1,640 ppm. These results suggest that TPH impacts have occurred to a depth of 6 ft bgs at the mouth of the pipe discharge and persist in surface soils downstream of this discharge point. Historical data also indicate a “hot spot” area (10 ft by 2 ft by 6 ft) where the discharge pipe entered the drainage ditch.

Based on these results it was estimated that approximately 16.2 yd^3 of petroleum-impacted soil would require removal from the drainage ditch and “hot spot” associated with SEAD 40 (Parsons, 2002).

Final Report
Seneca Army Depot – SEADs 39 and 40
Contract No. DACA45-98-D-0004
Task Order No. 0034

SECTION 2

PROJECT MANAGEMENT

2. PROJECT MANAGEMENT

2.1 PROJECT ORGANIZATION

All work activities conducted by WESTON for this TO were coordinated with USACE, Omaha District, USACE, New York District (at SEDA), and SEDA. A list of primary representatives from each firm is listed below:

<u>FIRM/REPRESENTATIVE</u>	<u>ROLE</u>
SEAD	
Mr. Steven Absolom	Base Environmental Coordinator
USACE	
Mr. Thomas Westenburg	Project Manager
Mr. Thomas Battaglia	Contracting Officers Representative and On-site Representative (OSR)
WESTON	
Mr. Guy Johnstone	Project Manager
Mr. Steven Kirejczyk	On-site Site Manager/Quality Control (QC)
Ms. Kristina Rickman	On-Site Site Safety and Health Officer/Sample Technician
SUBCONTRACTORS	

All work was self-performed; Charter Environmental was subcontractors to perform transportation and disposal of the excavated soil.

2.2 PROJECT SCHEDULE

The TCRA for SEADs 39 and 40 was performed in conjunction with removal activities for SEAD 5 (submitted under separate cover). Personnel and equipment were mobilized on 4 August 2003 and excavation and waste disposal activities were conducted between 20 and

21 August 2003. Post-excavation confirmation sampling was performed on 21 August 2003. Additional delineation sampling was conducted on 16 October 2003.

2.3 COORDINATION, PLANNING, AND MEETINGS

The Omaha District Rapid Response Project Manager scheduled a pre-construction meeting and site walk on 4 August 2003. Attendees at this meeting included the Rapid Response Project Engineer and OSR, representatives from USACE, New York District and Resident Office, and WESTON's Site Manager/Site Safety and Health/Quality Control Officer. The meeting agenda conformed to the Omaha District Rapid Guide for Pre-construction Convergence (refer to Rapid Standard Operating Procedure 3.2).

Daily meetings were held at the site to discuss safety, planned work, and accomplished work. A safety tailgate meeting was held daily before any work was initiated at the site.

2.4 MEETING MINUTES, REPORTS, NOTICES, AND SUBMITTALS

Prior to mobilizing field personnel, equipment, and materials, WESTON submitted a *Work Plan*, *Site Safety and Health Plan*, and *Chemical Sampling and Analysis Plan (CSAP)* to USACE and New York State Department of Environmental Conservation (NYSDEC) in July 2003.

Throughout the duration of the project, WESTON prepared and submitted the following meeting minutes, reports, and notices:

- Analytical data summary tables (Appendix A).
- Photo documentation (Appendix B).
- Cost Updates (Appendix C)
- Chain-of-Custody documents, data validation reports, and laboratory data summary reports (Appendix D).
- Rapid Response QC Daily Reports (Appendix E).
- Non-hazardous waste manifests (Appendix F).
- Rapid Response Weekly Cost Reports (not included).

- Tailgate safety meeting minutes (with daily QC Reports).

Final Report
Seneca Army Depot - SEADs 39 and 40
Contract No. DACA45-98-D-0004
Task Order No. 0034

SECTION 3

SITE ACTIVITIES

3. SITE ACTIVITIES

The primary objective of this TCRA was to reduce or eliminate any potential threat to human health, public welfare, or the environment that could exist as a result of historical activities associated with SEADs 39 and 40 that have resulted in elevated levels of TPH in soil. Satisfactory reduction of TPH and other potential COCs will provide for “clean closure” and future transfer status of these SWMUs. To accomplish this objective, WESTON performed the following tasks:

- **Task 1. Mobilization:** This task included procurement and mobilization of all equipment and personnel necessary to perform the work.
- **Task 2. Site Preparation:** This task included layout of work areas, site inspection to determine necessary erosion and sedimentation controls (as applicable), clearing and grubbing, and establishment of work zones including equipment staging.
- **Task 3. Soil Removal:** This task consisted of excavating impacted soils from SEADs 39 and 40.
- **Task 4. Sampling and Analysis:** This task included the collection and analysis of post-excavation confirmatory samples from SEADs 39 and 40 for contaminant delineation. This task also included waste characterization sampling and analysis prior to off-site disposal of the excavated materials.
- **Task 5. Transportation and Disposal:** This task included the preparation of waste manifests and shipping papers, and transportation and disposal of waste materials to a licensed disposal facility.
- **Task 6. Site Restoration:** Following completion of the excavation activities, the excavated areas were graded to facilitate proper drainage.
- **Task 7. Demobilization:** This task included the demobilization of all equipment, personnel, and materials from the site following completion of all field work.

3.1 TASK 1 – MOBILIZATION

WESTON mobilized to the site on 4 August 2003. The mobilization task included the procurement and delivery of equipment and personnel necessary to implement all aspects of the work as defined in the *Final Work Plan* (WESTON, July 2003). This task included moving into

office space provided by SEDA for use during the project, mobilizing construction equipment and project personnel, and familiarizing project personnel with the site and project requirements.

3.2 TASK 2 – SITE PREPARATION

Following mobilization, WESTON conducted site preparation activities which included: establishment of support facilities (including an existing decontamination area); delineation of work areas; utility clearance; and clearing and grubbing.

3.2.1 Survey

Prior to starting excavation activities, WESTON staked out the areas to be excavated in SEADs 39 and 40. The area to be excavated in SEAD 39 was bordered by Building 121 to the south, by the Center Road to the north, an access road to the east, and an above ground storage tank and a smoke stack to the west. The area to be excavated at SEAD 40 was located adjacent to the railroad tracks north of Building 319 and included the drainage ditch. Since the areas to be excavated at SEADs 39 and 40 were well delineated by surface features, surveying was not required to locate or define these features or the excavation areas.

3.2.2 Air Monitoring

A Community Air Monitoring Program was performed in accordance with New York State Department of Health and NYSDEC requirements during the excavation. Air monitoring consisted of continuous dust/particulate monitoring along the perimeter of the work zone and within the work zone using two Personal Data Rams (PDRs). Elevated levels of dust/particulates were never observed using the PDRs during excavation activities.

3.2.3 Erosion and Sedimentation Control

SEADs 39 and 40 were inspected by USACE and WESTON prior to excavation to determine whether erosion and sedimentation controls were necessary to manage storm water runoff within the work areas. Based on the inspection findings it was determined that erosion and sediment controls were not necessary for SEADs 39 and 40.

further indicate that the benzo(a)pyrene TEQ is not exceeded at depths greater than 6 inches, or within 5 linear feet, of the initial post-excavation sample.

Metals

Analytical results indicate that the target metal mercury was detected above the NY TAGM goal at one sample location (PX-SS-004); however, the sitewide average for mercury met the criteria for this compound.

Non-target metals (arsenic, barium, and silver) were detected above the NY TAGM goal in eight samples, which represent four sample locations (PX-SS-003, PX-SS-004, PX-SS-005, and PX-SS-008). The sitewide average was below the recommended cleanup goals for barium, but slightly above for arsenic and silver.

All post-excavation and delineation sample results for SEAD 39 are presented in summary Tables A-1 and A-2 (PAHs/metals and VOCs, respectively) in Appendix A. Laboratory analytical data are included in Appendix D for reference.

4.2 SEAD 40

A total of 18 post-excavation confirmation samples were collected in August 2003 from SEAD 40. A total of 29 additional delineation samples were collected from SEAD 40 in October 2003. The 18 initial post-excavation samples included four floor samples (SEAD40-FX-SS-001FS thru SEAD40-FX-SS-004FS) and 14 perimeter samples (SEAD40-PX-SS-005 thru SEAD40-PX-SS-018FS). These samples were analyzed for VOCs, PAHs, and metals. The 29 additional delineation samples represent the following post-excavation sample locations where exceedances were reported for one or more parameters: FX-SS-001; FX-SS-004; and PX-SS-005 thru PX-SS-013. Post-excavation and delineation sample locations are shown in Figure 3-1.

VOCs

Analytical results indicate that the target VOC methylene chloride was detected in one post-excavation sample (FX-SS-004FS) above the NY TAGM criteria. However, additional

3.2.4 Clearing

SEADs 39 and 40 were inspected for brush clearance prior to excavation. It was observed that trees, shrubs, and vegetation were clear from the area surrounding each excavation area within the two SEADs. In addition, the area for heavy equipment access was also clear. No additional clearing and grubbing were performed. Caution tape and survey stakes were installed along the perimeter of the excavations to secure the areas from unauthorized access.

3.2.5 Staging Area

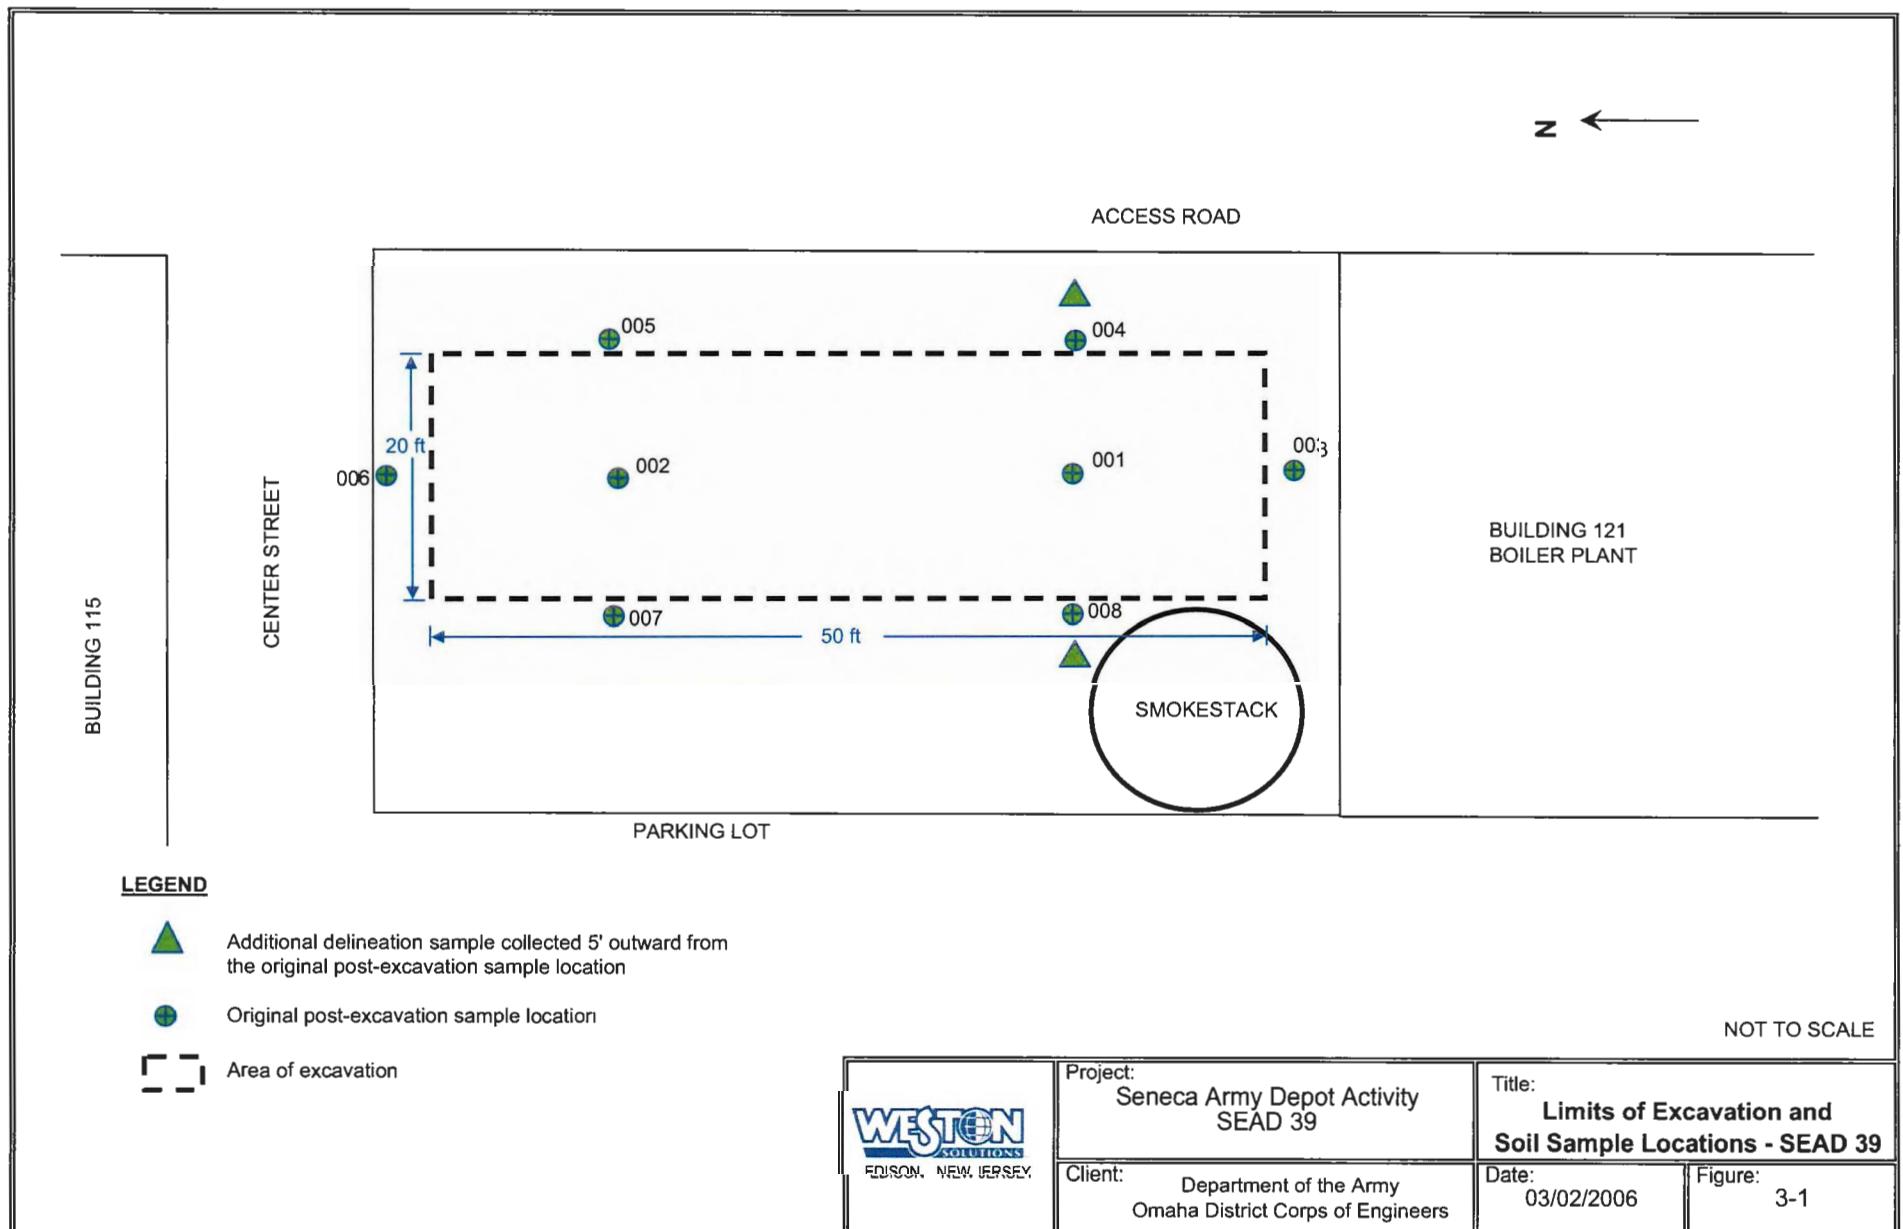

Due to the limited scope of the excavation, excavated material was directly loaded for off-site disposal. An exception was topsoil removed from SEAD 39, which was staged to the west side of the excavation area.

3.3 TASK 3 – SOIL REMOVAL

Excavation activities at SEADs 39 and 40 commenced on 20 August 2003. Excavation activities were conducted at SEAD 39 first. An expedited turn-around-time (3 days) was arranged for confirmatory sample analysis to minimize down-time in the event that additional excavation was deemed necessary. Within each SEAD, excavation work focused on individual excavation areas in succession, as directed by the OSR and the site conditions.

3.3.1 SEAD 39

Excavation of impacted soils from SEAD 39 began on 20 August 2003. The 20-ft by 50-ft area of impacted soil was previously identified immediately adjacent to Building 121 (Parsons 2002). Figure 3-1 depicts the actual excavation area. As previously indicated, the impacted material was located beneath approximately 6 inches of topsoil, and this area represents a total of approximately 18.5 yd^3 of impacted material. Therefore, the top 6 inches of soil was excavated and stockpiled on-site prior to excavating the impacted soil. The impacted soils were excavated to a depth of 6 inches and transported off-site for disposal as non-hazardous waste. To facilitate the waste characterization and disposal process, WESTON collected in-situ pre-characterization

Project:

samples from the proposed excavation area prior to removing the soil. This allowed for direct loading of the excavated soil for off-site disposal.

3.3.2 SEAD 40

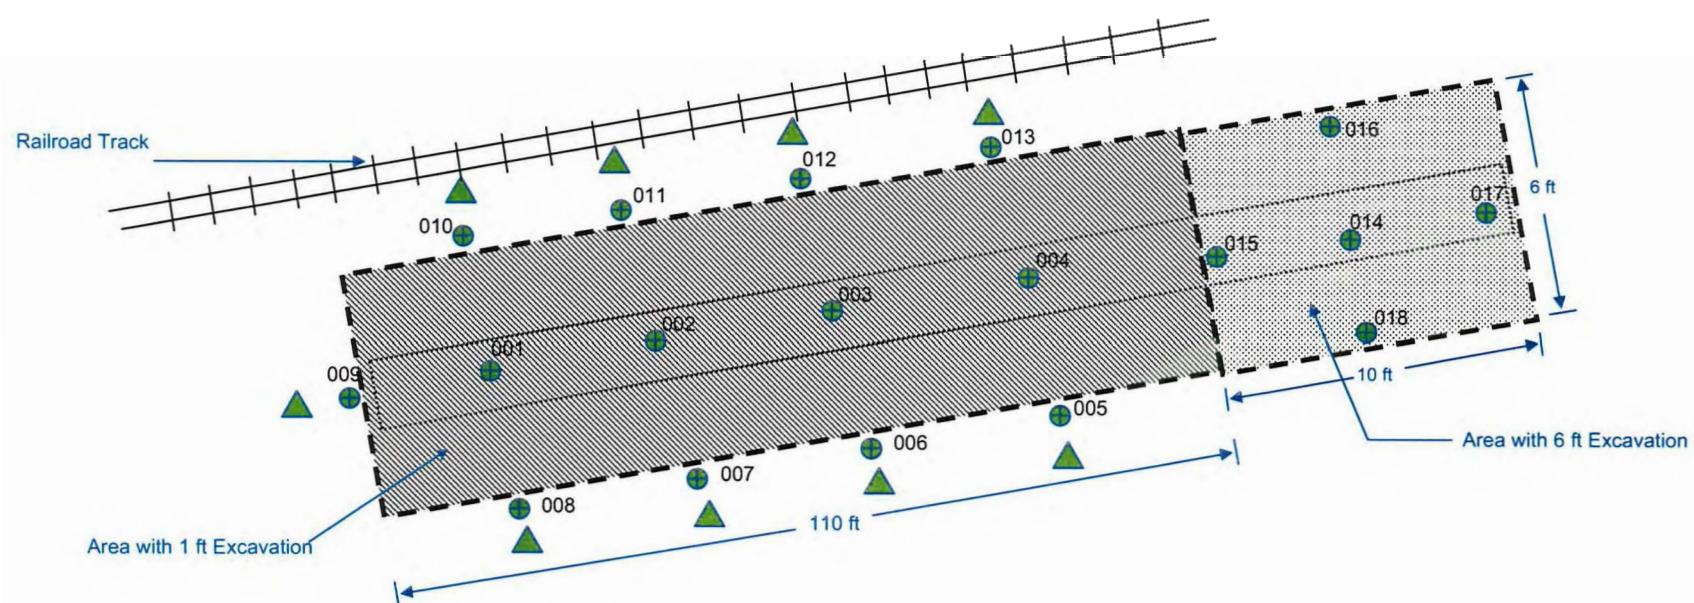

Excavation of impacted soils from SEAD 40 began on 21 August 2003. The 2-ft by 120-ft drainage ditch area and 6-ft by 6-ft “hot spot” area were previously identified northeast of Building 319. Figure 3-2 depicts the actual excavation areas. Excavation depths varied in two portions of the former 120 ft long drainage ditch area. From the mouth of the drainage pipe to 10 ft downstream the ditch was excavated to a depth of 6 ft. The remainder of the impacted ditch was excavated to a depth of 1 foot. These areas represent a total of approximately 17 yd³ of impacted material. To facilitate the waste characterization and disposal process, WESTON collected in-situ pre-characterization samples from the proposed excavation areas prior to removing the impacted soil. This allowed for direct loading of the excavated material for off-site disposal.

3.4 TASK 4 – SAMPLING AND ANALYSIS

During the previous investigation conducted in 1993 and 1994, soil samples were collected for TPH analysis only, and no other COCs were analyzed. Following completion of removal action in August 2003, confirmation samples were collected from the soils remaining at the excavation and analyzed for VOCs, selected SVOCs (PAHs), and metals to confirm whether the potential COCs were present in the soils.

3.4.1 Initial Post-Excavation Confirmation Sampling – August 2003

Post-excavation confirmatory soil samples were collected in August 2003 immediately following completion of excavation activities in both SEAD 39 and SEAD 40. Confirmation samples were collected as discrete soil samples from the base (floor) and sidewalls (perimeter) of each excavation. Floor samples were collected at a rate of approximately one sample per 900 square feet. Perimeter samples were collected from the midpoint of the excavation sidewalls at a rate of approximately one sample per 30 linear feet.

Client:
Department of the Army
Omaha District Corps of Engineers

Title:
**Limits of Excavation and
Soil Sample Locations- SEAD 40**

Date:
03/02/2006

Figure:
3-2

All sample locations were surveyed using a Model 5700 Trimble Real Time Kinematics Global Positioning System. Sample locations for SEADs 39 and 40 are shown in Figures 3-1 and 3-2. The soil samples were sent to AMRO Environmental Laboratory in Merrimack, New Hampshire for analysis of VOCs [U.S. Environmental Protection Agency (USEPA) Method 5035/8260B], PAHs (USEPA method SW-846/3541/3540B/ 8270C) and metals (USEPA Method SW-846/6010B).

Soil sampling was conducted in accordance with the procedures and protocols described in the CSAP (WESTON, July 2003). Samples were collected using decontaminated, inert sampling equipment and placed in the appropriate sample containers (40 milliliter vials for VOC analyses and 4 ounce jars for metals analyses).

3.4.2 Additional Delineation Sampling – October 2003

The initial post-excavation confirmation sampling results indicated PAH and metal exceedances were detected in some of the initial post-excavation confirmatory soil samples, WESTON remobilized to the site in October 2003, and collected additional samples from the excavation areas to further determine the extent of potential contamination remaining in SEADs 39 and 40. Soil delineation samples were collected using the following approach:

1. At each floor sample location where exceedances had been detected during post-excavation sampling, one additional sample was collected at a depth of 6 inches below the original sample depth.
2. At each perimeter sample location where exceedances had been detected during post-excavation sampling, one additional sample was collected at a depth of 6–12 inches below the original sample depth.
3. Additional perimeter samples were collected a lateral distance of 5 ft from each of the original perimeter sample locations where exceedances had been detected during initial post-excavation sampling. At the additional perimeter sample locations, one sample was collected at a depth of 0–6 inches bgs and one sample was collected at a depth of 6–12 inches bgs.

Additional soil samples collected in October 2003 were also analyzed for VOCs, PAHs, and metals. The delineation sample locations for SEADs 39 and 40 are shown in Figures 3-1 and 3-2, respectively, presented in Section 3. Quality Control samples were collected during both the

August and October sampling events. The QC samples included field duplicates and matrix spike/matrix spike duplicates (MS/MSD). The QC samples were collected at a rate of one duplicate and one MS/MSD for every 10 field samples. No Quality Assurance samples were collected.

The analytical results of confirmation sampling are presented and discussed in detail in Section 4. All post-excavation and delineation sample results are included in Appendix A. Laboratory analytical data are included in Appendix D for reference.

3.4.3 Waste Characterization Sampling

Approximately 18.5 yd³ of impacted soil was excavated from SEAD 39 and 17 yd³ of impacted soil was excavated from SEAD 40. The excavated materials were characterized in accordance with the state and federal regulatory requirements, as well as site-specific testing criteria required by the disposal facility. In order to expedite excavation and disposal activities, WESTON collected one in-situ waste characterization sample from each proposed excavation area prior to beginning the excavation activities. Waste samples were analyzed for toxicity characteristic leaching procedure (TCLP) VOCs and SVOCs, pesticides, TCLP metals, ignitability, reactivity, corrosivity, total polychlorinated biphenyls, pH, paint filter, and percent solids. The samples were analyzed by AMRO. Based on waste characterization sampling results the soil was classified as non-hazardous material for off-site disposal.

3.5 TASK 5 – TRANSPORTATION AND DISPOSAL

Prior to off-site disposal of the excavated materials, WESTON prepared a waste manifest package for each waste stream for USACE's review and approval. The excavated soil from SEADs 39 and 40 was then transported by Charter Environmental, Inc. to the Waste Management of New York landfill in Chaffee, New York for disposal as non-hazardous material. All loads were inspected by WESTON prior to leaving the site. Manifests and disposal documentation are maintained on file. Disposal summary sheets are provided in Appendix F.

3.6 TASK 6 – SITE RESTORATION

Following acceptance of the confirmatory data, WESTON graded the excavation areas, per USACE's direction, such that sufficient grade for surface drainage was maintained in each area. Additional clean fill material was not applied to either excavation area.

3.7 TASK 7 – DEMOBILIZATION

WESTON personnel demobilized from the site following completion of the removal action and post-excavation confirmation sampling in August 2003. Under USACE's direction, Weston personnel returned to the site to collect additional delineation samples in October 2003. Based on the sampling results, the TCRA was successfully completed and no further field activities are planned or scheduled by USACE for SEADs 39 and 40.

3.8 TCRA COST SUMMARY

As of 20 February 2006, the total project cost incurred for TCRA at both SEADs 39 and 40 is \$75,513.17. The cost includes efforts for field removal activities, laboratory analysis, waste T&D, report preparation, and project management. A financial breakdown table is provided in Appendix C.

Final Report
Seneca Army Depot – SEADs 39 and 40
Contract No. DACA45-98-D-0004
Task Order No. 0034

SECTION 4
SOIL SAMPLING RESULT AND DATA ANALYSIS

4. SOIL SAMPLING RESULTS AND DATA ANALYSIS

The analytical data of confirmation sampling were also used to determine if soils impacted with TPH and/or other potential contaminants of concern, such as VOCs, SVOCs, and metals, have been successfully removed and therefore reduce the potential threats, current or future, to environment and human health. Discussions of the confirmation sampling results for SEADs 39 and 40 presented in Sections 4.1 and 4.2.

4.1 SEAD 39

A total of eight post-excavation confirmation samples were collected in August 2003 from SEAD 39. A total of eight additional delineation samples were collected from SEAD 39 in October 2003. The eight initial post-excavation samples included two floor samples (SEAD39-FX-SS-001FS and SEAD39-FX-SS-002FS) and six perimeter samples (SEAD39-PX-SS-003 thru SEAD39-PX-SS-008FS). These samples were analyzed for VOCs, PAHs, and metals. The eight additional delineation samples represent the following post-excavation sample locations where exceedances were reported for one or more parameters: PX-SS-003; PX-SS-004; PX-SS-005; PX-SS-006; and PX-SS-008. Post-excavation and delineation sample locations are shown in Figure 3-1.

VOCs

Analytical results indicate that none of the target VOC analytes were detected above the recommended New York Technical and Administrative Guidance Memorandum (NY TAGM) goals in any post-excavation or delineation samples collected from SEAD 39.

PAHs

Analytical results indicate that one or more PAH parameters were detected above the NY TAGM criteria in both post-excavation and delineation samples collected from SEAD 39. Although PAH exceedances were detected in post-excavation and delineation samples, the benzo(a)pyrene toxicity equivalent (TEQ) was exceeded at only two sample locations (PX-SS-003 and PX-SS-008). Results of the delineation sampling conducted at sample location PX-SS-008

delineation sampling results show this analyte was not detected above the NY TAGM goal below 6 inches at below this location, and the sitewide average for all sample locations is below the recommended cleanup goals. None of the other VOC analytes were detected above the NY TAGM goals in any of the other post-excavation or delineation samples collected from SEAD 40.

PAHs

Analytical results indicate that one or more PAH parameters were detected above the NY TAGM goals in both post-excavation and delineation samples collected from SEAD 40. Although PAH exceedances were detected in post-excavation and delineation samples, the sitewide average benzo(a)pyrene TEQ did not exceed the recommended cleanup goal.

Metals

Analytical results indicate that the target metal mercury was not detected above the NY TAGM goal in any of the post-excavation or delineation samples collected from SEAD 40.

Non-target metals (arsenic, barium, and chromium) were detected above the NY TAGM goals in both post-excavation and delineation samples. However, the sitewide average was below the recommended cleanup goals for both barium and chromium, but slightly above for arsenic.

All post-excavation and delineation sample results for SEAD 40 are presented in summary Tables A-3 and A-4 (PAHs/metals and VOCs, respectively) in Appendix A. Laboratory analytical data are included in Appendix D for reference.

SECTION 5

CONCLUSIONS AND RECOMMENDATIONS

5. CONCLUSIONS AND RECOMMENDATIONS

The objective of this TCRA was to remove TPH-impacted soil from SEADs 39 and 40 to reduce the risk of potential threats, current or future, that may exist as a result of contaminated soils detected at these sites. To achieve this directive, WESTON excavated approximately 18.5 yd³ of contaminated soil from SEAD 39 and approximately 17 yd³ from SEAD 40. Post-excavation and delineation samples were then collected from each area and the results were compared to the NY TAGM goals to verify satisfactory removal of TPH and other potential COCs caused by historical discharge of boiler blowdown liquids.

Based on these post-excavation sampling results, major conclusions for each SWMU include the following:

SEAD 39

- During the TCRA activities conducted at SEAD 39, WESTON removed approximately 18.5 yd³ of impacted soil from the former boiler blowdown leach pit area. The previously identified area of impacted soil measured 20 ft by 50 ft, and was excavated by WESTON to a depth of 1 ft.
- None of the target VOC parameters were detected above the recommended NY TAGM goals in any of the post-excavation samples collected from SEAD 39.
- All soils excavated from SEAD 39 were disposed of off-site as non-hazardous waste based on the waste characterization sampling results. No Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) or Resource Conservation and Recovery Act (RCRA) regulated material was identified based upon sampling results.
- The average concentration of PAHs in post-excavation and delineation samples indicates that the concentration of these contaminants has been reduced.
- The sitewide averages for arsenic and silver were slightly above the cleanup criteria, while the mercury value was met.
- Although individual samples for metals and PAHs may exceed one or more NY TAGM goals, the cleanup objectives for VOCs have been met.

- It is the Army's opinion that sample results indicate the original concentration of contaminants is most likely related to industrial activity rather than a release from the boiler blowdown sump.

SEAD 40

- During the TCRA activities conducted at SEAD 40, WESTON removed approximately 17 yd³ of soil from the former boiler blowdown leach pit area. The previously identified area of impacted soil measured 120 ft by 6 ft. The northern portion of the impacted area (110 ft by 6 ft) was excavated to a depth of 1 ft. The remaining southern portion of the impacted area (10 ft by 6 ft) was excavated to a depth of 6 ft.
- One target VOC parameter (methylene chloride) was detected at a concentration of 130 micrograms per kilogram ($\mu\text{g}/\text{Kg}$), which is above the NY TAGM goal of 100 $\mu\text{g}/\text{Kg}$. This exceedance occurred at a depth of 0-6 inches bgs at sample location FX-SS-004. Additional sampling at this location indicated levels of methylene chloride were not detected at depths exceeding 6 inches bgs. The average concentration of methylene chloride is below the cleanup goal for the site.
- No other VOC parameters were found to exceed the NY TAGM goal at any other post-excavation sampling locations associated with SEAD 40.
- All soils excavated from SEAD 40 were disposed of off-site as non-hazardous material based on the waste characterization sampling results. No CERCLA or RCRA regulated material was identified.
- The average concentration of PAHs in post-excavation and delineation samples indicate the concentration of these contaminants has been reduced and the sitewide average benzo(a)pyrene TEQ is below the recommended cleanup goal. It is noted that many perimeter confirmation samples are located adjacent to a paved parking lot or railroad track. The residual contamination results indicate they are associated with general industrial activity at the site rather than a defined release.
- Three non-target metals were detected above the cleanup goals in some post-excavation samples. The sitewide average concentration is below the cleanup goal for barium and chromium, but slightly above for arsenic. Since none of these metals were contaminants of concern, and the target metal mercury was not detected, the cleanup objective has been met
- Although individual samples for metals and PAHs may exceed one or more NY TAGM goals, the cleanup objectives for VOCs have been met.

- It is the Army's opinion that sample results indicate the original concentration of contaminants is most likely related to industrial activity rather than a release from the boiler blowdown sump.

Following excavation of TPH-impacted soils from SEADs 39 and 40, the previously identified potential threat to the public and the environment identified in the *Action Memorandum and Decision Document* (Parsons 2002) has been substantially reduced based on elimination of VOCs and reduction of PAHs and metals. In addition to a reduction of contaminant levels, no CERCLA releases have been identified, and it is the opinion of the Army that original contaminant concentrations detected at these sites are most likely related to industrial activity rather than a release from historic boiler blowdown liquids. As such, it is recommended that USACE, SEDA, NYSDEC, and USEPA evaluate these sites for closure and transfer status.

Note:

1. The Cleanup goal is based on the New York Technical Administrative Guidance Memorandum (TAGM) No.4046 Recommended Soil Cleanup Objectives. Values denoted as Site Background ("SB") in TAGM 4046 were compared with the highlighted values (95th percentile of Seneca Army Depot (SEDA) Site Background) in lieu of the TAGM "SB" since no background cleanup objectives exist for certain parameters.
2. Where exceedances for individual PAHs exist, evaluation of the Benzo(a)pyrene Toxicity Equivalent for total carcinogenic PAHs (cPAHs) would not exceed the 10,000 µg/kg limit for total cPAHs for any sample collected. The cPAHs include: benzo(a)pyrene; dibenzo(a,h)anthracene; benzo(a,h)anthracene; benzo(b)fluoranthene; indeno(1,2,3-cd)pyrene; benzo(k)fluoranthene; and chrysene.
3. Benzo(a)pyrene TEQ for carcinogenic PAHs is calculated by multiplying the individual cPAH results by the applicable factor from the list below, and then summing the results:

Benzo(a)pyrene = 1.0
Dibenzo(a,h)anthracene = 1.0
Benzo(a)anthracene = 0.1
Benzo(b)fluoranthene = 0.1
Indeno(1,2,3-cd)pyrene = 0.1
Benzo(k)fluoranthene = 0.01
Chrysene = 0.01

4. U.S. Environmental Protection Agency Risk Based Residential Cleanup Goal for lead

5. Site-specific cleanup goal for mercury is 0.13 mg/kg

mg/kg= milligram per kilogram

µg/kg= microgram per kilogram

J= Result is less than the RL, but greater than or equal to the MDL.

M= Manually integrated compound.

ND = Not detected at reporting limit

NA = Not analyzed

SB = Site background

NE = New York TAGM not established for this compound

 **Result Exceeds Cleanup Objective**

 **Site background Level**

FS1 samples - samples collected from the original post-excavation sample location at a depth of 6" to 12" bgs

FS2 samples - samples collected at location approximately 5 ft outward from the perimeter post-excavation sample location at a depth of 0" to 6" bgs

FS3 samples - samples collected at location approximately 5 ft outward from the perimeter post-excavation sample location at a depth of 6" to 12" bgs

Note:

1. The Cleanup goal is based on the New York Technical Administrative Guidance Memorandum (TAGM) No.4046 Recommended Soil Cleanup Objectives. Values denoted as Site Background ("SB") in TAGM 4046 were compared with the highlighted values (95th percentile of Seneca Army Depot (SEDA) Site Background) in lieu of the TAGM "SB" since no background cleanup objectives exist for certain parameters.
2. Where exceedances for individual PAHs exist, evaluation of the Benzo(a)pyrene Toxicity Equivalent for total carcinogenic PAHs (cPAHs) would not exceed the 10,000 µg/kg limit for total cPAHs for any sample collected. The cPAHs include: benzo(a)pyrene; dibenzo(a,h)anthracene; benzo(a,h)anthracene; benzo(b)fluoranthene; indeno(1,2,3-cd)pyrene; benzo(k)fluoranthene; and chrysene.
3. Benzo(a)pyrene TEQ for carcinogenic PAHs is calculated by multiplying the individual cPAH results by the applicable factor from the list below, and then summing the results:

Benzo(a)pyrene = 1.0
Dibenzo(a,h)anthracene = 1.0
Benzo(a)anthracene = 0.1
Benzo(b)fluoranthene = 0.1
Indeno(1,2,3-cd)pyrene = 0.1
Benzo(k)fluoranthene = 0.01
Chrysene = 0.01

4. U.S. Environmental Protection Agency Risk Based Residential Cleanup Goal for lead

5. Site-specific cleanup goal for mercury is 0.13 mg/kg

mg/kg= milligram per kilogram

µg/kg= microgram per kilogram

J= Result is less than the RL, but greater than or equal to the MDL.

M= Manually integrated compound.

ND = Not detected at reporting limit

NA = Not analyzed

SB = Site background

NE = New York TAGM not established for this compound

 **Result Exceeds Cleanup Objective**

 **Site background Level**

FS1 samples - samples collected from the original post-excavation sample location at a depth of 6" to 12" bgs

FS2 samples - samples collected at location approximately 5 ft outward from the perimeter post-excavation sample location at a depth of 0" to 6" bgs

FS3 samples - samples collected at location approximately 5 ft outward from the perimeter post-excavation sample location at a depth of 6" to 12" bgs

Tetrachloroethene	ND	25		µg/Kg	1	8/21/03 2:58:00 PM

Qualifiers: ND - Not Detected at the Reporting Limit

S - Spike Recovery outside accepted recovery limits

J - Analyte detected below quantitation limits

I - PID outside accepted recovery limits

B - Analyte detected in the associated Method Plan

II - Value above quantitation range

H - Method prescribed holding time exceeded

- See Case Narrative

RL - Reporting Limit; defined as the lowest concentration the laboratory can accurately quantitate.

DATA COMMENT PAGE

Organic Data Qualifiers

- ND Indicates compound was analyzed for, but not detected at or above the reporting limit.
- J Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the data indicates the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than the method detection limit.
- H Method prescribed holding time exceeded.
- E This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
- B This flag is used when the analyte is found in the associated blank as well as in the sample.
- R RPD outside accepted recovery limits
- RL Reporting limit; defined as the lowest concentration the laboratory can accurately quantitate.
- S Spike Recovery outside accepted recovery limits.
- # See Case Narrative

Inorganic Data Qualifiers

- ND or Indicates element was analyzed for, but not detected at or above the reporting limit.
- J Indicates a value greater than or equal to the method detection limit, but less than the quantitation limit.
- H Indicates analytical holding time exceedance.
- B Indicates that the analyte is found in the associated blank, as well as in the sample.
- MSA Indicates value determined by the Method of Standard Addition
- E This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
- R RPD outside accepted recovery limits
- RL Reporting limit; defined as the lowest concentration the laboratory can accurately quantitate.
- S Spike Recovery outside accepted recovery limits.
- + Indicates the correlation coefficient for the Method of Standard Addition is less than 0.995
- # See Case Narrative

Report Comments:

1. Soil, sediment and sludge sample results are reported on a "dry weight" basis.
2. Reporting limits are adjusted for sample size used, dilutions and moisture content, if applicable.

DATA COMMENT PAGE

Organic Data Qualifiers

- ND Indicates compound was analyzed for, but not detected at or above the reporting limit.
- J Indicates an estimated value. This flag is used either when estimating a concentration for tentatively identified compounds where a 1:1 response is assumed, or when the data indicates the presence of a compound that meets the identification criteria but the result is less than the sample quantitation limit but greater than the method detection limit.
- H Method prescribed holding time exceeded.
- E This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
- B This flag is used when the analyte is found in the associated blank as well as in the sample.
- R RPD outside accepted recovery limits
- RL Reporting limit; defined as the lowest concentration the laboratory can accurately quantitate.
- S Spike Recovery outside accepted recovery limits.
- # See Case Narrative

Inorganic Data Qualifiers

- ND or Indicates element was analyzed for, but not detected at or above the reporting limit.
- J Indicates a value greater than or equal to the method detection limit, but less than the quantitation limit.
- H Indicates analytical holding time exceedance.
- B Indicates that the analyte is found in the associated blank, as well as in the sample.
- MSA Indicates value determined by the Method of Standard Addition
- E This flag identifies compounds whose concentrations exceed the calibration range of the instrument for that specific analysis.
- R RPD outside accepted recovery limits
- RL Reporting limit; defined as the lowest concentration the laboratory can accurately quantitate.
- S Spike Recovery outside accepted recovery limits.
- + Indicates the correlation coefficient for the Method of Standard Addition is less than 0.995
- # See Case Narrative

Report Comments:

1. Soil, sediment and sludge sample results are reported on a "dry weight" basis.
2. Reporting limits are adjusted for sample size used, dilutions and moisture content, if applicable.

Subcontractors: (Company Name
- Trade/Service)

None

PROJECT EQUIPMENT

(Company Name – Description)

- WESTON – (1) Pick-up trucks, (1) CAT 950 Loader

AGREEMENTS & CONVERSATIONS

- WESTON and CENAN took part of a site walk for all SEADs on project.
- Notified by Sessler that approval from Seneca Meadows Landfill for soil was not obtained. Sessler and WESTON are trying to resolve the issue.

MATERIALS DELIVERED

(Company Name - Amount - Condition - Purpose)

- (1) CAT 950 Loader
- (2) PDR
- (1) PID

TEST DATA

(List type and location of tests performed and results)

- None

SAFETY COMMENTS/VIOLATIONS

- Held job opening meeting with discussion about the Site Health and Safety Plan and had all persons sign the plan that was to work on this project(s).

WORK COMPLETED- BY WESTON

- Mobilized site and conducted site walk.

WORK COMPLETED BY SUBCONTRACTORS

(Company Name – task description)

- N/A

Level of Protection (A,B,C,D): **D**

Topics of Discussion:

Discussed: Weather for the day, hot and very humid. Drink lots of fluids and take frequent, regular breaks for hydration. Also, watch for slips and trip/falls. Keep all required PPE on at all times while sampling and operation of equipment.

Also, discussion on truck drivers for T&D. Drivers must have proper PPE when exiting the truck.

TEST DATA

(List type and location of tests performed and results)

- WESTON collected (8) confirmation samples at SEAD 39 to be analyzed for PAH's, VOC's, and RCRA 8 Metals. That completes the sampling at SEAD 39
- WESTON collected (7) confirmation samples at SEAD 5 to be analyzed for PAH's and RCRA 8 Metals plus Copper and Zinc.

SAFETY COMMENTS/VIOLATIONS

- Held safety meeting at 06:30.

WORK COMPLETED- BY WESTON

- Loaded 2 trucks with SEAD 5 soil for transportation and disposal at Waste Management of NY Landfill, in Chaffee, NY. Total tonnage for 08/20/03 was 68.11.

RAPID RESPONSE QUALITY CONTROL DAILY REPORT

Seneca Army Depot

WORK COMPLETED BY SUBCONTRACTORS

(Company Name – task description)

- Taconic Trucking hauled 2 loads of SEAD 5 soil from the Seneca Army Depot to the Waste Management of NY Landfill, in Chaffee, NY.

Syracuse Supply arrived on site to transport the excavator from SEAD 39 to SEAD 40, however due to a hold up in the landfill the excavator was still needed to load soil out tomorrow morning. Syracuse Supply left the site without moving the excavator. This move will be done tomorrow morning.
