Mr. John Nohrstedt U.S. Army Corps of Engineers Engineering and Support Center, Huntsville Attn: CEHNC-FS-IS 4820 University Square Huntsville, Alabama 35816-1822

**SUBJECT:** 

Draft Final Well Decommissioning Report, Seneca Army Depot Activity, Romulus, Seneca County, New York; USACE Contract W912DY-08-D-0003, Delivery Orders 0002 and 0008 and AFCEE Contract FA8903-04-D-8675, Task Order 31, CRDL-001C

Dear Mr. Nohrstedt:

Parsons Infrastructure & Technology Group Inc. (Parsons) is pleased to submit the Draft Final Well Decommissioning Report for the Seneca Army Depot Activity in Romulus, Seneca County, New York. This work included the decommissioning of wells at 19 sites at the Depot. This work was performed in accordance with the Scope of Work for Delivery Orders 0002 and 0008 under Contract W912DY-08-D-0003.

Parsons appreciates the opportunity to provide you with the Report for this work. Should you have any questions, please do not hesitate to call me at (617) 449-1405 to discuss them.

Sincerely,

Todd Heino, P.E., Vice President

Program Manager

Dear Mr. Nohrstedt:

Parsons Infrastructure & Technology Group Inc. (Parsons) is pleased to submit the Draft Final Well Decommissioning Report for the Seneca Army Depot Activity in Romulus, Seneca County, New York. This work included the decommissioning of wells at SEAD-4 (the Munitions Washout Facility and SEAD-11 (the Old Construction Debris Landfill). This work was performed in accordance with the Scope of Work under Contract FA8903-04-D-8675 Task Order 0031. Also included is a copy of the Army's Response to Comments on the Draft Well Decommissioning Report that were received from the EPA on June 28, 2011.

Parsons appreciates the opportunity to provide you with the Report for this work. Should you have any questions, please do not hesitate to call me at (617) 449-1405 to discuss them.

Sincerely,

Todd Heino, P.E., Vice President

#### 1.0 INTRODUCTION

This report documents the decommissioning of 146 groundwater monitoring wells located at the former Seneca Army Depot Activity (SEDA or the Depot) in Seneca County, New York (EPA CERCLIS Site ID: NY0213820830; NYS Inactive Waste Site ID: 8-50-006). The monitoring wells were decommissioned because they are no longer needed for long-term monitoring or continuing environmental sampling and analysis purposes associated with Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) or State of New York Inactive Hazardous Waste Site investigations and studies that continue at the former Depot as the Army fulfills its federal and state environmental assessment, remediation, and long-term monitoring obligations. SEDA was listed as a Federal Facility on the National Priorities List (NPL) in August of 1990, and since its listing, the Army has worked to identify and quantify the levels of environmental contamination that are present, and when determined to be necessary, remediate identified contamination to mitigate or eliminate potential risks and hazards to the public and environment that may be associated with its presence in the media at, and in the vicinity, of the Depot. Under this work, the Army has conducted environmental assessments and evaluations at 112 known or suspected areas of concern (AOCs) located within the bounds of the Depot. As a result of these assessments and evaluations, 27 suspected AOCs were eliminated from further study and analysis, with oversight agency concurrence and approval, after initial assessments and evaluations indicated that suspected contaminants were not present at levels that posed unacceptable levels of threats or risk. The remaining 76 AOCs were assessed under the CERCLA and other aligned regulatory programs, and findings and conclusions of these assessments have led to remedial action decisions that have been documented in Records of Decision (RODs) that have been approved by, or gained concurrence of, oversight regulatory agencies. Of the AOCs processed to RODs, 30 required no action (NA), 17 required no further action (NFA) once interim actions were completed, and the remaining 29 AOCs are subject to land use controls (LUCs) or other continuing regulatory requirements. Long-term groundwater monitoring required under approved RODs is continuing at four AOCs (SEAD-16, former Abandoned Deactivation Furnace Site; SEAD-17, former Existing Deactivation Furnace Site; SEAD-23, former Open Burning [OB] Grounds; and, SEAD-25, former Fire Training and Demonstration Pad) and one operable unit (the Ash Landfill Operable Unit, SEADs 3, 6, 8, 14 and 15). Environmental assessments and final regulatory action and approval are still pending at the remaining nine AOCs.

The decommissioning of the monitoring wells was performed in accordance with the U.S. Army's (Army's) August 2010 Work Plan titled *Well Decommissioning Plan for SEAD-4*, *SEAD-5*, *Ash Landfill Operable Unit*, *SEAD-11*, *SEAD-12*, *SEAD-13*, *SEAD-24*, *SEAD-25*, *SEAD-26*, *SEAD-27*, *SEAD-48*, *SEAD-59*, *SEAD-63*, *SEAD-67*, *SEAD-70*, *SEAD-71*, *SEAD-119B*, *SEAD-121C*, *and SEAD-122B*, *Seneca Army Depot Activity* (Parsons, 2010). The Work Plan was prepared based on the procedures and recommendations provided in New York State Department of Environmental Conservation's (NYSDEC's) Draft guidance titled *Groundwater Monitoring Well Decommissioning* issued January 8, 2009. The well decommissioning was performed on behalf of the U.S. Army, Seneca Army Depot Activity under Contracts issued by U.S. Army, Engineering and Support Center, Huntsville (USAESCH – W912DY-08-D-0003, Task Orders 2, and 8) and the U.S. Air Force Center

for Engineering and the Environment (AFCEE – FA8903-04-D-8675, Task Order 31) by Parsons Infrastructure & Technology Group Inc. (Parsons) and GeoLogic NY, Inc. Well decommissioning completed at SEAD-4 and SEAD-11 was conducted under work authorized under AFCEE's Contract FA8903-04-D-8675, Task Order 31, while the decommissioning activities completed at SEAD-13 were performed under work authorized under USAESCH's Contract W912DY-08-D-0003, Task Order 2. Well decommissioning activities completed at all of the other sites were performed under work authorized under USAESCH's Contract W912DY-08-D-0003, Task Order 8.

Wells decommissioned under this work were located at 24 former solid waste management units (SWMU) or AOCs within the Depot. SWMU/AOC descriptions corresponding to the SEAD designations are identified below, along with a brief description of the site's current regulatory status:

- SEAD-3, 6, 8, 14 and 15: The Ash Landfill Operable Unit approved ROD; LUCs and long-term monitoring groundwater monitoring required at designated wells.
- SEAD-4/38: The Munitions Washout Facility/ Building 2079 Boiler Blow Down Pit approved ROD; NFA with release of land for unrestricted use and unlimited exposures, no required groundwater monitoring.
- SEAD-5: Former Sludge Waste Piles approved ROD; LUCs required, no required groundwater monitoring.
- SEAD-11: Old Construction Debris Landfill approved ROD; NFA with release of land for unrestricted use and unlimited exposures, no required groundwater monitoring.
- SEAD-12: Radioactive Waste Burial Sites regulatory status pending, but no long-term groundwater monitoring anticipated necessary.
- SEAD-13: Inhibited Red Fuming Nitric Acid (IRFNA) Disposal Site approved ROD; LUCs required, no required groundwater monitoring.
- SEAD-24: Abandoned Powder Burning Pit approved ROD; NFA with release of land for unrestricted use and unlimited exposures, no required groundwater monitoring required.
- SEAD-25: The Fire Training and Demonstration Pad approved ROD; LUCs and long-term groundwater monitoring required at designated wells.
- SEAD-26: The Fire Training Pit and Area approved ROD; LUCs required, no required continuing long-term groundwater monitoring.
- SEAD-27: Steam Cleaning Waste Tank in Building 360 approved ROD; LUCs required, no required groundwater monitoring.
- SEAD-48: Row E0800 Pitchblende Ore Storage Igloos approved ROD; NFA with land released for unrestricted use and unlimited exposures, no groundwater monitoring required.
- SEAD-59: Fill Area West of Building 135 approved ROD; LUCs required no required groundwater monitoring.

- SEAD-63: Miscellaneous Components Burial Site approved ROD; NFA with release for land for unrestricted use and unlimited exposures, no groundwater monitoring required.
- SEAD-67: Dump Site east of Sewage Treatment Plant No. 4 approved ROD; LUCs required no required groundwater monitoring.
- SEAD-70: Fill Area Adjacent to Building T-2110 regulatory status pending, but no long-term groundwater monitoring anticipated.
- SEAD-71: Alleged Paint Disposal Area approved ROD; LUCs required no required groundwater monitoring.
- SEAD-119B: Former Small Arms Range at the Lake Housing Area NA, not a site of interest, no required groundwater monitoring.
- SEAD-121C: Defense Reutilization and Marketing Office (DRMO) Yard approved ROD; LUCs required, no required groundwater monitoring.
- SEAD-122B: Small Arms Range at the Airfield Parcel approved ROD; LUCs required, no required groundwater monitoring.

The locations of the affected SEADs are shown on **Figure 1.** Wells decommissioned under this work were either not needed, or designated by the Army as being unlikely to be needed, for continuing monitoring of groundwater quality or conditions at sites where they were installed. Wells designated for decommissioning at SEAD-25 and the Ash Landfill Operable Unit (SEADs 3, 6, 8, 14, & 15) are not included amongst the wells that have been included in the continuing long-term monitoring programs implemented and continuing at these sites. The Army does not anticipate that long-term groundwater monitoring will be required at SEAD-12 or SEAD-70, as past investigations and studies have not suggested that groundwater quality is of concern at either of these sites; however, if future monitoring of groundwater is required at one or both of these sites, once proposed plans or RODs are negotiated and finalized, then new wells will be installed as needed to satisfy the requirements of the defined groundwater monitoring program.

A complete list of the groundwater wells decommissioned at each SWMU/AOC and data documenting their former location is provided in **Table 1-1**. Additional information pertinent to the decommissioning method is also summarized in the table.

#### 2.0 AREA OF CONCERN DESCRIPTION AND STATUS

Specific information pertinent to the environmental conditions at the former SWMU/AOCs where groundwater monitoring wells were decommissioned are presented below, along with summaries of any submitted reports and the proposed or approved plans for each.

### SEADs 3, 6, 8, 14 and 15: The Ash Landfill Operable Unit

The Ash Landfill Operable Unit is located in the west-central portion of the Depot and encompasses an area of approximately 46.7 acres. From 1941 to 1974, uncontaminated trash was burned in a series of burn pits near the former incinerator building (Building 2207). Building 2207 was demolished in 2007. According to a U.S. Army Environmental Hygiene Agency (USAEHA) Interim Final Report, Groundwater Contamination Survey No. 38-26-0868-88 (USAEHA, 1987), the ash from the refuse burning pits was buried in the Ash Landfill (SEAD-6) from 1941 until the late 1950s or early 1960s. According to an undated aerial photograph of the incinerator during operation, the active area of the Ash Landfill extended at least 500 feet north of the incinerator building, near a bend in a dirt road. A fire destroyed the incinerator on May 8, 1979, and the landfill was subsequently closed. Post-closure, the landfill was apparently covered with native soil of various thicknesses, but was not closed with an engineered cover or cap. Other areas at the site were used as a grease pit and for burning debris, and for the burial of non-combustible materials at a site on the south and west sides of the intersection of Smith Farm and North South Base Line roads.

Site investigations of the Ash Landfill identified a groundwater plume comprised primarily of chlorinated VOCs including trichloroethene and its daughter degradation products (dichloroethenes and vinyl chloride) in the shallow aquifer beneath the site and indicated that it was migrating towards the boundary of the Depot. The Army conducted an interim remedial measure in 1998 in which a 650-foot long permeable reactive wall containing zero-valence reactive iron granules was installed near the Depot's fence line to intercept the identified plume. The wall was installed as a demonstration program to show that the reactive wall could be effective in reducing concentrations of chlorinated ethenes through reactive dechlorination.

As such, the ROD for the Ash Landfill (Parsons, 2005a) required the installation of three in-situ permeable reactive barrier walls, and maintenance of the proposed walls and the existing wall for migration control of the groundwater plume. Further within the final *Remedial Design Report for the Ash Landfill Operable Unit* (Parsons, 2006a) the Army indicated that groundwater monitoring, including plume monitoring and biowall performance monitoring, would be performed as part of the Ash Landfill OU post-closure operations. Performance monitoring was required to measure groundwater contaminant concentrations and the effectiveness of the reactive barrier walls remedy for the Ash landfill OU. Monitoring wells currently being sampled as part of the continuing long-term monitoring (LTM) program at the Ash Landfill OU include MW-56, MWT-22, MWT-23, MWT-24, MWT-25, MWT-26, MWT-27, MWT-28, MWT-29, MWT-7, PT-17, PT-18A, PT-22, and PT-24. Four additional wells (i.e., MW-48, MW-60 PT-16, and PT-20) were retained for groundwater elevation contour map purposes, while MW-58D was retained as it has USGS monitoring equipment

currently installed within it. Other wells at the site are no longer needed and were scheduled for decommissioning.

The locations of monitoring wells decommissioned at the Ash Landfill are shown on **Figure 2**.

## SEAD-4/38: The Munitions Washout Facility/Building 2079 Boiler Blow Down Pit

The SEAD-4 site consists of two parcels of land that encompass approximately 47.5 acres that sit on opposite sides of Seneca Road in the southwestern portion of the former Depot. The portion of SEAD-4 located to the north and east of Seneca Road sits atop and on the southwestern face of a downwardly sloping hill that flattens out near Seneca Road. This portion of SEAD-4 previously contained numerous paved and dirt access roads, several buildings, assorted out structures, and manmade drainage ditches once associated with the former Munitions Washout operations, many of which have now been demolished and removed. One of the buildings previously located within the northern portion of SEAD-4 was Building 2079, which was a boiler house that was used to produce steam in support of SEAD-4's munitions washout operations. Building 2079 was demolished by the Army in 2007. Prior to 1980, boiler blow down liquids were discharged into an earthen pit outside of Building 2079, where they were allowed to infiltrate into the ground or flow over the surface until they were captured in SEAD-4's drainage ditches. The location where the boiler blow down liquid was discharged outside of Building 2079, which is fully surrounded by the greater area of SEAD-4, was designated by the Army as SEAD-38.

The southwestern portion of SEAD-4 is and has predominantly been undeveloped over time. Unoccupied closed buildings and building remnants are located adjacent to the southwestern edge of Seneca Road, but these give way to unoccupied and undeveloped areas as one crosses this portion of the site from Seneca Road to the railroad line that bounds the site to the west. Numerous earthen drainage ditches lead to the south and west towards the location of a former lagoon that once was located in this portion of the site, but which was drained and removed during the soil excavation and disposal remedial action conducted at this AOC.

The approved ROD for SEAD-4/38 (Parsons, 2008b) required the excavation and off-site disposal of soil, ditch soil, and lagoon soil that were contaminated with concentrations of select metals (e.g., chromium, lead, vanadium) that posed potential risk to certain ecological receptors. As part of the remedial action, the former on-site lagoon was dewatered to facilitate the excavation of the contaminated lagoon soil, and once the contaminated lagoon soil was removed, the location of the lagoon was regraded to promote positive flow away from its former location. Other excavation areas that could not be graded to promote positive drainage or that were more than 4 feet in depth near the

<sup>&</sup>lt;sup>1</sup> Boiler blow down is a maintenance operation used to reduce scale buildup resulting from mineral deposits within boiler pipes where water is converted to steam. Minerals contained within the boiler feed water do not vaporize along with the water and deposit in the boiler tube, producing scale that reduces the efficiency of the boiler operation and which can cause corrosion or clogging of the pipes. Blowdown liquids are used to lift the scale deposits and flush them out of the system.

road or site buildings were backfilled with clean fill. Backfill used was chemically characterized and the analytical results were compared to the NYSDEC Unrestricted Use soil cleanup objectives (SCOs) for volatile and semivolatile organic compounds, to approved soil cleanup objective levels for lead and chromium, and to approved residual metal concentrations found at the site for other metals. The ROD (Parsons, 2008b) also documented that other site conditions previously identified as a concern (i.e., prior presence of contaminated debris in Buildings 2073, 2076, 2078, 2084, and 2085 and the demolition and removal of Building 2079) had been removed and had achieved desired goals specified in the ROD.

The ROD further noted that several VOCs and metals had been identified at concentrations exceeding EPA or/and NYSDEC standards in the groundwater at SEAD-4/38; however, the noted elevated concentrations were observed only in a single round of sampling (i.e., not confirmed by during follow-up sampling rounds at the same location). The ROD concluded that the referenced VOCs and metals did not pose significant risks to potential receptors at SEAD-4/38 based on the baseline risk assessment and therefore, the approved remedy for the site did not require groundwater treatment or monitoring.

Section 3.1.9 of the *Final Remedial Design Work Plan and Design Report for SEAD-4* (Parsons, 2008c) indicated that long-term monitoring of the groundwater was not an element of the proposed remedial action at the site, and as such, the 13 groundwater monitoring wells located at site were designated for decommissioning in accordance with NYSDEC's guidance.

The locations of monitoring wells that were decommissioned at SEAD-4/38 are shown on Figure 3.

#### SEAD-5: Former Sewage Sludge Waste Piles

SEAD-5 is a rectangular parcel of land encompassing approximately 3.1 acres in the east-central portion of the Depot. SEAD-5 is located approximately 600 feet west of Building 135 and approximately 3,000 feet west-southwest of the Depot's main entrance on State Route 96. During the 1980s, sewage sludge from the Depot wastewater treatment plants (WWTPs) located in Buildings 4 and 715 was stockpiled at SEAD-5; sludge generated from the WWTPs was removed from drying beds near the buildings and transported to SEAD-5 bi-monthly where it was staged until its disposal. Portions of SEAD-5 were also used as part of the Depot's former Public Works storage and staging area for heavy equipment, materials, and supplies. At present some of the land within and surrounding SEAD-5 continues to be used by the Seneca County Highway Department as a staging and storage area for its equipment and supplies.

During 2009, a soil cover, required per terms of an approved ROD (Parsons, 2009b) for the site, was constructed over a portion of SEAD-5 where soils were determined to contain levels of carcinogenic polyaromatic hydrocarbons (cPAHs) at levels that posed potential risk or health hazards to future commercial and industrial users of the property. The soil cover was constructed of reclaimed soil originating from non-time critical removal actions conducted at other sites within the Depot, a demarcation barrier (i.e., colored "snow fence"), and 1-foot of borrow material (i.e., bank run sand, gravel, and crushed concrete) derived from on- and off-site sources. All soil and borrow material was

tested and compared to NYSDEC Restricted Commercial Use SCOs prior to its use. The soil cover overlies an area encompassing approximately 1.6 acres of land within SEAD-5 that is located adjacent to, and extends south of, the unnamed dirt road that runs along SEAD-5's northern bound. This unnamed road originates at the intersection of Administration Avenue, 4<sup>th</sup> Avenue, and South Street in the former Administration Area of the Depot, which is northeast of SEAD-5, and travels westward toward what previously was the location of the abandoned munitions deactivation furnace (SEAD-16) to the west. Provisions of the SEAD-5 ROD (Parsons, 2009b) prohibit unauthorized excavations or other activities that might compromise the integrity of the soil cover, prohibits use of the land for residential purposes, and prohibits access to and use of groundwater at the site. Long-term monitoring of the groundwater at SEAD-5 was not required as data provided indicated that the groundwater quality at the site was consistent with the regional groundwater quality. On this basis, all of the wells located at SEAD-5 were designated for decommissioning.

The locations of monitoring wells decommissioned at SEAD-5 are shown on **Figure 4**.

#### SEAD-11: Old Construction Debris Landfill

The former Old Construction Debris Landfill (SEAD-11) was located in the southwestern portion of the Seneca Army Depot Activity. During its existence, SEAD-11 measured approximately 4 acres in size. Prior to the interim removal action (IRA), which was conducted between October 2006 and January 2007 and during which all buried debris and fill was excavated and transported off-site for disposal at a licensed landfill, SEAD-11 was characterized as a terraced area of elevated topography that was set on the western face of downwardly sloping terrain that ends near the Depot's outer security fence line, in the vicinity of the former airfield's northwestern end. The current SEAD-11 site is vacant, and generally follows the pre-disposal activity sloping terrain that existed in this portion of the Depot prior to the Army's occupation.

After completion of the IRA at SEAD-11, the Army and the EPA selected and documented a remedial decision of No Further Action for SEAD-11 in the ROD (Parsons, 2009d) for the site, with release of the property for unrestricted use and unlimited exposures. On this basis, groundwater monitoring is no longer required at this site and the seven groundwater monitoring wells located at the site were selected for decommissioning.

The locations of monitoring wells decommissioned at SEAD-11 are shown on **Figure 5**.

#### SEAD-12: Radioactive Waste Burial Sites

The former Radiological Waste Burial Sites (SEAD-12) are located in the north-central portion of SEDA in the former secured Weapons Storage Area (WSA). Investigation of SEAD-12 originally began as the investigation of two separate areas, formerly designated as SEAD-12A (Radioactive Waste Burial Site – northeast corner of the Q) and SEAD-12B (Radioactive Waste Burial Site – northeast of Buildings 803, 804, and 805). SEAD-12A encompassed an area measuring approximately 1,500 feet long by 900 feet wide that was suspected to have included up to five separate, small burial pits. SEAD-12B encompassed an area measuring 300 feet long by 300 feet wide, and was suspected to have included a 5,000 gallon storage tank and a small dry waste pit.

After the completion of preliminary site investigations at SEAD-12A and SEAD-12B in 1995, the bounds of SEAD-12 were expanded based on the similarity of the chemicals found at the two historic SEADs and the general history of the overall WSA, which suggested that similar constituents were likely to exist throughout the larger area. The re-defined SEAD-12 encompassed 360 acres including all property north of Service Road No. 4 except that which was designated as SEAD-63, the Miscellaneous Components Burial Site, located partway along the western edge of the WSA. Land located north of Service Road Number 2 was used for disposal of laboratory and maintenance wastes and military components. This portion of SEAD-12 also includes Buildings 802 through 807, 810, 812 and 825, which were part of the WSA facility at SEDA. The eastern, western, and southern portions of SEAD-12 are primarily open fields and include Buildings 813 through 817, 819, and 823.

The results of the remedial investigation generally indicated that groundwater contamination, exclusive of the presence of trichloroethylene and dichloroethylene in one well (MW12-37), was not a significant concern within SEAD-12. The groundwater contamination identified at MW12-37 was addressed during an interim removal action in the area surrounding this well, and during this action, the affected well was removed (Parsons, 2006c). Based on this action, the Army does not foresee a future need to monitor groundwater at this site, and on this basis all wells were scheduled for decommissioning.

The locations of monitoring wells decommissioned at SEAD-12 are shown on Figures 6a and 6b.

# **SEAD-13 IRFNA Disposal Site**

The former Inhibited Red Fuming Nitric Acid (IRFNA) Disposal site (SEAD-13) encompasses approximately 3 acres and included two separate disposal areas, (SEAD-13 East and SEAD-13 West) located on the eastern and western sides of the southern end of the Depot's Duck Pond, respectively, near the entrance of its source tributary. The ground surface in both areas is less than 2 feet above the water level of the Duck Pond. SEAD-13 East is bound by mostly deciduous trees and the East-West Baseline Road to the north, by deciduous trees and grassland to the east and south, and by the Duck Pond to the west. SEAD-13 West is bound by grassland and low brush to the north, west and south, and by the Duck Pond to the east.

Historically, SEAD-13 was used during the early 1960s to dispose of unserviceable IRFNA, an oxidizer used in missile liquid propellant systems. Each barrel of unserviceable IRFNA was emptied through a water pressure-powered, stainless steel ejector that was fitted onto one barrel at a time while water was flowing through the ejector. The mixture of IRFNA and water was discharged to the disposal pit through a long polyethylene hose that discharged beneath the surface of the pit being used. The discharged IRFNA/water solution mixed with the limestone in the pit to facilitate the neutralization of the acid.

The approved ROD for SEAD-13 (Parsons, 2007) specified that No Further Action in conjunction with the implementation and maintenance of a land use control that prohibited access to and use of the groundwater at the site. The groundwater access and use restriction for SEAD-13 was imposed as a result of the groundwater concentrations of nitrate, aluminum, and manganese that were detected at the

site; however, there was no data collected that indicated that the contaminated groundwater extended beyond the bounds of the AOC, or discharged into the Duck Pond. The groundwater use/access LUC will remain in effect until concentrations of identified hazardous substances beneath the AOC are reduced to levels that allowed for unrestricted use and unlimited exposures. The ROD for SEAD-13 did not require groundwater monitoring, and on this basis groundwater monitoring is no longer required at this site and the groundwater monitoring wells located at the site were designated for decommissioning.

The locations of monitoring wells decommissioned at SEAD-13 are shown on Figure 7.

#### SEAD-24: Abandoned Powder Burning Pit

The former SEAD-24 site is located in the west-central portion of SEDA. The burning pit previously located in this AOC encompassed an area measuring approximately 325 feet by 150 feet; and it was surrounded on the east, south, and west by a U-shaped, vegetated berm that was approximately 4 feet high. The historic burn pit and berm area was excavated and removed during a time-critical removal action (TCRA) that was conducted between 2003 and 2006.

The former SEAD-24 site is bounded by West Kendaia Road to the north and by areas of open grassland and low brush to the east, south, and west. SEDA railroad tracks are located approximately 400 feet east of the former U-shaped berm. The Abandoned Powder Burning Pit was active during the 1940s and 1950s. Although operating practices at this site are unknown, black powder, M10 and M16 solid propellants, and explosive trash were probably disposed at this location by burning. Petroleum hydrocarbon fuel may have been used to initiate burns.

The Army and the EPA selected and documented a final remedial decision of No Further Action with release of the land for unrestricted use and unlimited exposures in the ROD for SEAD-24 (Parsons 2009c), and this decision received concurrence from the NYSDEC in 2009. As NFA was required for groundwater, the three groundwater monitoring wells installed at this site were designated for decommissioning by the Army.

The locations of monitoring wells decommissioned at SEAD-24 are shown on **Figure 8**.

#### SEAD-25: The Fire Training and Demonstration Pad

The former Fire Training and Demonstration Pad (SEAD-25) is located in the east-central portion of SEDA. The site is bound to the east by Administration Avenue, to the south by Ordnance Drive, to the west by grassland, brush and conifers, and to the north by grassland and a baseball field. SEAD-25 was used from the late 1960s to the late 1980s for fire control training. During the 1980s, the pad was used twice for firefighting demonstrations. A remedial action focused on the excavation of volatile organic compound and semi-volatile organic compound contaminated soil from the area was conducted in 2005. In addition, the approved ROD for SEAD-25 (Parsons, 2004b) required that groundwater monitoring be conducted until groundwater concentrations of volatile organic compounds achieved groundwater quality standards to demonstrate that additional impacts to the groundwater at and downgradient of the site were controlled. As part of the groundwater monitoring program design for SEAD-25 (Parsons, 2005b), the Army designed nine of the original 19 site wells

installed at the SEAD-25 site as locations that would be monitored to assess groundwater quality conditions. The periodic monitoring of wells at SEAD-25 continues in the designated nine wells (i.e., MW25-2, MW25-3, MW25-8, MW25-9, MW25-10, MW25-13, MW25-15, MW25-17, and MW25-18), and the Army also continues to gauge groundwater elevations in three other site well (i.e., MW25-1, MW25-6, and MW25-19) to provide additional information about the local groundwater elevation and flow conditions. SEAD-25 wells decommissioned by the Army during this effort included MW25-\$4d, MW25-7D, MW25-12D, MW25-14D, and MW25-16D; MW25-5D was removed during the remedial action in 2005

The locations of monitoring wells decommissioned at SEAD-25 are shown on Figure 9.

### SEAD-26: The Fire Training Pit and Area

The former Fire Training Pit and Area (SEAD-26) is located in the southeastern portion of SEDA. The site is bounded to the east and west by SEDA railroad tracks; on the south by grassland and low brush; and on the north by 7<sup>th</sup> Street. SEAD-26 was in use from 1977 to 1994. The site was used one to four times a year for firefighting training. During training activates various flammable materials were floated on water, ignited, and extinguished. Investigations of SEAD-26 indicated that soil at the site was contaminated with polyaromatic hydrocarbons (PAHs) at concentrations in excess of state soil cleanup objective levels. In addition, there was an indication that groundwater at the site had been impacted by volatile organic compounds at varying concentrations.

Based on these findings, the Army conducted a remedial action that focused on the excavation and disposal of soils that were contaminated with PAHs. In addition, the ROD prepared and approved for the site (Parsons, 2004b) included a requirement to conduct groundwater monitoring at the site to further characterize the quality of the groundwater. Five of the 11 groundwater wells previously installed at the site were selected for monitoring in the Remedial Design Work Plan and Design Report (Parsons, 2005b). At the conclusion of the first year of post-remedial action groundwater monitoring, the Army recommended that groundwater monitoring was no longer required at SEAD-26 as concentrations of volatile organic compounds of concern were below cleanup goals. The agencies agreed with the Army's recommendation, and as a result of their approval, groundwater monitoring is no longer required at SEAD-26 and the groundwater monitoring wells at the site were selected for decommissioning.

The locations of monitoring wells decommissioned at SEAD-26 are shown on **Figure 10**.

#### SEAD-27: Steam Cleaning Waste Tank in Building 360

Located in the east-central portion of the Depot, Building 360 was the former location of equipment refurbishing and reconstruction operations. During operations, equipment such as lathes, presses, and metal-working machines were degreased with steam, high-pressure water, and detergents in the cleaning area. Once cleaned the equipment was moved to other portions of Building 360 for rehabilitation. The Steam Cleaning Waste Tank (SEAD-27) was located in Building 360. It is a below ground, concrete tank above which track-mounted cars loaded with equipment requiring cleaning were positioned and steam cleaned. The floor surrounding and overlying the waste tank

slopes towards the tank to channel all condensate and over spray back towards the tracks and collection grates. The maximum capacity of the Steam Cleaning Waste Tank is approximately 5,000 gallons when filled to near the top or 1,100 gallons to the 2-foot freeboard mark. Use of the Steam Cleaning Waste Tank began in 1976 and ceased in January 1990.

The Army and the EPA selected and documented the implementation and maintenance of institutional controls as the proposed remedy for all land within the greater Planned Industrial/Office Development and Warehousing (PID) Areas at the Depot in the ROD (Parsons, 2004c) approved for SEAD-27. The identified institutional controls included a prohibition against the use of the land for residential purposes, and a prohibition against access to, and use of the underlying groundwater in the PID Area, due to the known poor quality of the groundwater in this area. The final ROD (Parsons, 2004c) did not contain any provision that required groundwater monitoring within the PID Area. On this basis, groundwater monitoring is not required at this site and the groundwater monitoring wells located at the site were selected for decommissioning.

The locations of monitoring wells decommissioned at SEAD-27 are shown on **Figure 11**.

#### SEAD-48: Row E0800 Pitchblende Ore Storage Igloos

SEAD-48 is located in the southern part of the Depot along the southern side of Igloo Road No. 39, bounded to the east by Fayette Road and to the west by Seneca Road. SEAD-48 consists of 11 ammunition storage bunkers (i.e., igloos) identified as Igloos E0801 through E0811. Each igloo is constructed of reinforced concrete that is shaped like a half-cylinder and measure 26.8 feet wide by 81 feet long by 13 feet high at their highest point. During the 1940s, 1,823 barrels of pitchblende, a uranium containing ore, were stored in the igloos for approximately three months. Upon the removal of the pitchblende, the igloos became a storage site for non-radioactive munitions through the late 1970s. Licensed radioactive commodities were stored in Igloos E0801 and E0802 until the late 1970s.

The Army and the EPA selected No Further Action as the final remedy for SEAD-48, and this decision was documented in the ROD (Parsons, 2009c) approved by both parties with concurrence obtained from the NYSDEC in 2009. As no further action was required for groundwater, the historic monitoring wells at this location were designated for decommissioning under this project.

The locations of monitoring wells decommissioned at SEAD-48 are shown on **Figure 12**.

# SEAD-59: Fill Area West of Building 135

The Fill Area West of Building 135 (SEAD-59) is located in the east-central portion of SEDA. SEAD-59 is approximately 4 acres in size and encompasses an area along both sides of an unnamed dirt road that runs from the intersection of South Street, 4<sup>th</sup> Avenue, and Administration Avenue westerly through the former Depot's and current Seneca County Highway Department's maintenance yard and into the area previously occupied by the Army's historic Deactivation Furnaces (SEAD-16 and SEAD-17). Historically, SEAD-59 was used for the disposal of construction debris and oily sludge, and as the Army's version of a local Department of Public Works yard where vehicles and materials were staged.

Based on the results of site investigations performed at SEAD-59, the Army and the EPA selected to impose land use restrictions that prohibited use of the property for residential purposes and prohibited access to, and use of, groundwater, at the site. NYSDEC concurred with the remedy selected for this site. The ROD (Parsons, 2009a) did not require that groundwater monitoring be conducted at this site Based on the approval of the ROD, groundwater monitoring is not required at this site and the groundwater monitoring wells located at the site were selected for decommissioning.

The locations of monitoring wells decommissioned at SEAD-59 are shown on **Figure 13**.

#### SEAD-63: Miscellaneous Components Burial Site

Located inside the former secured WSA adjacent to SEAD-12 in the northern area of the former Depot, SEAD-63 is bounded by paved roads on the north, south, and west and by open grassland to the east. SEAD-63 was previously an undeveloped burial site located in an area that measured approximately 480 ft. by 300 ft., much of which was covered with vegetation. SEAD-63 was used from the 1950s to 1980s as a disposal area for classified parts. During this period, multiple disposal pits were excavated along a north-south line measuring approximately 200 ft. in length. SEDA personnel associated with SEAD-63 identified the types of materials disposed at this site as metal parts and "inert materials."

The Army conducted a non-time critical removal action (NTCRA) at SEAD-63 in 2004, and during the NTCRA approximately 5,100 tons of solid waste was excavated from the former burial pit locations and transported off-site to a licensed landfill where it was disposed. Subsequent to the completion of the NTCRA, samples were collected from the monitoring wells surrounding the former burial pits and the results of these samples indicated that the local groundwater quality was within regulatory limits.

The Army and the EPA selected No Further Action as the final remedy for SEAD-63, and this decision was documented in the ROD (Parsons, 2006b) approved by both parties with concurrence obtained from the NYSDEC in 2006. As no further action was required for groundwater, the historic monitoring wells at this location were designated for decommissioning under this project.

The locations of monitoring wells decommissioned at SEAD-63 are shown on **Figure 14**.

#### SEAD-67: Dump Site east of Sewage Treatment Plant No. 4

The Dump Site east of Sewage Treatment Plant No. 4 (SEAD-67) is located in the east central portion of the Depot off of West Romulus Road. SEAD-67 was previously comprised of five waste piles and two berm structures that were located south of West Romulus Road in otherwise unoccupied land. Little is known about the history of SEAD-67 or the origin of the soil piles or bermed structures. An Expanded Site Inspection performed at SEAD-67 indicated that that soil at SEAD-67 had been impacted by SVOCs, polyaromatic hydrocarbons (PAHs), and mercury. Groundwater samples collected from SEAD-67 during the ESI indicated that elevated levels of iron, manganese, and aluminum were found in the groundwater at the site, but the groundwater samples characterized all contained elevated levels of turbidity.

The contents of the piles and the berm structures were removed during a TCRA conducted between 2002 and 2004 when all of the stockpiled soil and other surface soils were excavated and disposed off-site at a licensed landfill.

The Army and the EPA selected an action requiring land use controls as the final remedy for SEAD-67, and this decision was documented in the ROD (Parsons, 2007) approved by both parties with concurrence obtained from the NYSDEC in 2007. The selected land use controls included those imposed on the greater PID Area within the Depot prohibiting residential activities and access to and use of groundwater. No groundwater monitoring requirement was identified in the ROD (Parsons, 2007). On this basis, groundwater monitoring is not required at this site and the groundwater monitoring wells located at the site were selected for decommissioning.

The locations of monitoring wells decommissioned at SEAD-67 are shown on Figure 15.

#### SEAD-70: Fill Area Adjacent to former Building T-2110

The fill area that comprises SEAD-70 is located on the southern side of East-West Baseline Road approximately 750 feet west of its intersection with North-South Base Line Road. The AOC is a mounded landfill once used for construction debris. It is located on the southeastern side of the former Building T-2110, a collapsed wooden barn, which was demolished and removed in 2006.

Site investigations identified soil that was contaminated with select metals at levels that posed potential human health risks to future owners or users of the property. In response to this finding, the Army conducted a focused removal action of contaminated soil and then revised the risk assessment to reflect the new concentrations identified at the site. The results of this risk assessment are still pending regulatory review and approval. However, results for groundwater at this site did not identify undo risks to future owners or users of the site, and on this basis groundwater monitoring is not required at this site and the groundwater monitoring wells located at the site were selected for decommissioning.

The locations of monitoring wells decommissioned at SEAD-70 are shown on **Figure 16**.

#### SEAD-71: the Alleged Paint Disposal Area

The Alleged Paint Disposal Area (SEAD-71) is located in the east-central portion of SEDA. SEAD-71 is wedge shaped and is located west of 4<sup>th</sup> Avenue near Buildings 114 and 127. The AOC is approximately 2.4 acres in size and bounded on the north and south by railroad tracks serving Buildings 114 and 127. The topography is relatively flat with a gentle slope to the southwest.

Prior to the remedial investigation (RI), rumors suggested that paints and/or solvents were disposed at SEAD-71 in burial pits. The results of the RI test pitting operations failed to confirm the paint and oil disposal rumors, but did indicate that the area had been used for the disposal of construction debris, including sheet metal, asphalt, chain link fencing, sand and stone, piping, railroad ties, wood and cinders.

Based on the results of site investigations performed at SEAD-71, the Army and the EPA selected to impose land use restrictions that prohibited use of the property for residential purposes and prohibited

access to, and use of groundwater, at the site. NYSDEC concurred with the remedy selected for this site. Despite the groundwater access and use limitation, the ROD (Parsons, 2009a) did not require that groundwater monitoring be conducted at this site, as this restriction had previously been imposed throughout the greater PID Area. Based on the approval of the ROD, groundwater monitoring is not required at this site and the groundwater monitoring wells located at the site were selected for decommissioning.

The locations of monitoring wells decommissioned at SEAD-71 are shown on **Figure 13**.

#### SEAD-119B: Former Small Arms Range at the Lake Housing Area

The former Small Arms Range at the Lake Housing Area is located within approximately 5,000 feet west of the secured and fenced area of SEDA in the vicinity of an area where military personnel were previously billeted. This area is outside of the current SEDA boundaries, and within Sampson State Park. The site is bounded on the north by the gorge of the Kendaia Creek and by Scorpion Road on the south. The most recent photographs of SEAD-119B indicate that the site is overgrown with thick brush and small trees.

According to the ordnance and explosives (OE) Archive Search Report (ASR) (USACE, 1998), the Former Small Arms Range at the Lake Housing Area first appeared on Depot site plans in 27 February 1955 as part of the Sampson Air Force Base. Not much is known about the operation of SEAD-119B, but during operations it is likely that an earthen berm located at the range served as a backstop for small arms bullets.

The Army conducted an investigation of SEAD-119B in 2002 which included geophysical investigations, test pitting, soil sampling and analysis, and the installation and development of groundwater monitoring wells. However, based on the results of the geophysical survey, test pits, and soil sampling and analysis, the Army concluded that the area was not likely to have been used extensively, if at all, as a firing range. On this basis the Army concluded in the Final Findings Report for this site (Parsons, 2004a) that this presumed site should be removed from the list of potential SWMUs, and after review and consideration the EPA approved this recommendation. On this basis, the three wells previously installed at this location were selected for decommissioning as part of this effort.

The locations of monitoring wells decommissioned at SEAD-119B are shown on **Figure 17**.

#### SEAD-121C: Defense Reutilization and Marketing Office (DRMO) Yard

Located roughly 4,000 ft. southwest of the former Depot's main entrance off State Route 96, the DRMO Yard (SEAD-121C) is a triangular gravel lot encompassing approximately 8.75 acres. Several man-made features are prominent within the DRMO Yard including one storage building; an earthen-bottom, open storage cell; an elongated, segmented, rectangular-shaped, open concrete storage structure; and a multi-chambered, open storage cell. The DRMO Yard was used by the Army to store scrap metal, vehicles, and other items that were no longer needed for national defense, or that did not comply with legislative and regulatory requirements.

Based on the results of site investigations performed at SEAD-121C, the Army and the EPA selected to impose land use restrictions that prohibited use of the property for residential purposes and prohibited access to, and use of groundwater, at the site. NYSDEC concurred with the remedy selected for this site. Despite the groundwater access and use limitation, the ROD (Parsons, 2008a) did not require that groundwater monitoring be conducted at this site, as this restriction had previously been imposed throughout the greater PID Area. Based on the approval of the ROD, groundwater monitoring is not required at this site and the groundwater monitoring wells located at the site were selected for decommissioning.

The locations of monitoring wells decommissioned at SEAD-121C are shown on **Figure 18**.

### SEAD-122B: Small Arms Range at the Airfield Parcel

The Small Arms Range (SAR) (SEAD-122B) located within the Airfield Parcel of the Depot along Route 96A was previously used by the Air Force, Navy, and Army as a small arms qualification ground. The Airfield SAR is located in the southwest corner of SEDA adjacent to the SEDA Airfield. The SAR consists of two contiguous bermed small arms ranges: one previously used for small arms training, and the second previously used for machine gun targeting.

As part of a treatability study conducted in 2004, approximately 500 cy of soil were excavated from SEAD-122B. The excavations included removing of soil: from the floor of the range; from the western face of the backstop berm; and from a drainage swale.

Since construction by the Air Force in the early 1950s, the size and shape of the firing lanes and berms have been modified. The configuration of the firing lanes and berms observed during the investigations consisted of a 20-lane SAR with protective wooden baffles and a two-lane machine gun range. Each of the firing line areas were surrounded on three sides (north, east, and south) by earthen berms that measure up to 28 ft. in height. The firing line areas were suspected to contain UXO, high lead concentrations, and possibly other high metal concentrations. Underlying the firing lines within each range area was a network of footer drains that captured surface water runoff from within the firing lines and conveyed it to the open area located west of the SAR where it was discharged. The surface water and groundwater flow is anticipated to follow the general trend of the land and flow towards the west and Seneca Lake.

Results of site investigations, which included evaluations of soil, surface water, and groundwater, indicated that metals were present in soils at site at concentrations that exceeded soil cleanup objectives identified by the state. The Army subsequently commissioned at treatability study of site soils, and during the work conducted in 2004 removed, treated, and disposed of approximately 500 cubic yards from the former small arms range site. At the conclusion of this effort, the Army and EPA selected and documented in a ROD (Parsons, 2007) that no further action in concert with a land use control that prohibited use of the Airfield property to for residential purposes. This selected remedial action was approved by both parties, and concurrence was received from NYSDEC. Based on this decision, monitoring wells that were installed to facilitate groundwater sampling at this site are no longer

required, and they are included in the ones that have been designated for decommissioning under this project.

The locations of monitoring wells decommissioned at SEAD-122B are shown on Figure 19.

#### 3.0 WELL DECOMMISSIONING

#### 3.1 PRELIMINARY INSPECTION RESULTS

A preliminary site inspection of all wells selected for decommissioning was conducted between August 23 and August 27, 2010 to locate the wells and to evaluate if the wells were accessible by the equipment needed to complete the process. During these inspections, the general condition of the wells were also noted and recorded. During the site inspection, 31 wells of the selected wells could not be located in the field. Subsequent review of information recorded in prior site reports and documents, indicated that 26 of the missing wells were decommissioned during prior site actions; another four are suspected to have been proposed, but not installed as further review of available reports suggest that they were never sampled. The last well (MW70-2) is known to have been installed, as it was sampled during prior work commissioned by the Army, but no evidence of its prior existence was found at the site of installation. Further, five wells originally selected for decommissioning were retained due to their continued use for groundwater elevation gauging as part of the Ash landfill OU monitoring program, while two others were found to be in such poor condition they were added to those to be decommissioned.. The following information was collected during the preliminary site inspection:

- SEAD-13: Monitoring wells MW13-8, MW13-13, and MW13-14 were never installed based on a review of the associated documents. Brush or vegetation clearing was required to access 11 of the 12 locations prior to decommissioning.
- SEADs-5, 59, and 71: Monitoring wells MW5-1, MW5-3, MW59-3, MW59-5, and MW59-6, were decommissioned either during the SEAD-5 remedial action conducted in June 2009 or during the SEAD-59 and 71 Time Critical Removal Action conducted in 2002. Well 59-5 is suspected to never to have been installed as no record was ever found that it was sampled, and no coordinates were located for it in the Army's Seneca environmental database. Brush or vegetation clearing was required to access nine of the 10 locations prior to decommissioning.
- SEADs-12, 48, and 63: Monitoring wells MW12-07, MW12-08, MW12-10 through MW12-15, MW12-33, MW12-34, MW12-37 and MW12A-01, were decommissioned during either the SEAD-12 remedial action conducted in July 2009 or a previous program implemented at the Depot. Brush or vegetation clearing was required to access 28 of the 43 locations prior to decommissioning.
- SEADs-121C, 122B, and 70: Monitoring well MW70-2 was not found during the site work and was decommissioned during a previous program implemented at the Depot. A broken concrete collar was found at the location of MW70-3, but other components of the well (bollards and protective cap, well upriser and screen) were not found. Field personnel dug down to a depth of approximately five feet below grade but were unable to find any other portion of the well. The location was back filled with grout and covered with native soil.

Brush or vegetation clearing was required to access six of the 10 locations prior to be decommissioning.

- SEADs-25 and 26: Monitoring well MW25-11 was added to the list of wells to be decommissioned. Monitoring wells MW25-05D and MW26-09 were decommissioned during the remedial action conducted in November 2005. Brush or vegetation clearing was required to access 16 of the 22 locations prior to decommissioning.
- SEADs-24 and 67: Brush or vegetation clearing was required to access five of the six locations prior to decommissioning.
- Ash Landfill: Monitoring wells MW-45 and PT-11 were added to the list of wells to be decommissioned. Monitoring wells MW-48, MW-58D, MW-60, PT-16, and PT-20 were removed from the list since these wells are currently used for groundwater elevation gauging. Monitoring wells MW-05, MW-12A, MW21, and MW-35 were decommissioned during a previous program implemented at the Depot. Brush or vegetation clearing was required to access 22 of the 29 locations prior to decommissioning.
- SEADs 119B and 27: Brush or vegetation clearing was required to access three of the five locations prior to decommissioning
- SEAD-4: Monitoring wells MW4-4, MW4-6, MW4-8, and MW4-10 were decommissioned during the remedial action conducted in 2008. Brush or vegetation clearing was required to access seven of the nine locations prior to decommissioning.
- SEAD-11: Brush or vegetation clearing was required to access all seven locations prior to decommissioning.

The information generated during the preliminary site inspection is summarized on **Table 1-1**.

#### 3.2 WELL DECOMMISSIONING ACTIVITIES

The Army decommissioned 146 groundwater monitoring wells in accordance with specifications identified in its work plan "Well Decommissioning Work Plan" (Parsons, August 2010). The work plan originally designated 179 wells for decommissioning; however, during the preliminary inspection 31 wells could not be found at their identified locations; further review of available information indicated that 28 of these wells were previously decommissioned during prior investigation or removal actions conducted at the Depot or were not installed (i.e., MW59-5, MW13-13, and MW13-14). Three other wells previously not selected for decommissioning were found to be in poor condition and were included to those that were decommissioned; other decisions resulted in five wells originally scheduled for decommissioning to be retained. Northing and Easting coordinates of the decommissioned wells are provided in **Table 1-1**. The original construction details for all wells decommissioned (where available) are provided in **Appendix A**.

Two decommissioning events were conducted on or between the dates of September 13-24, 2010 and between the dates of January 25-27, 2011. The January 2011 mobilization event was required as site clearing and grubbing was not completed at some locations during September, access to the off-site

wells located in the farmer's field could not be gained until after the crop was harvested, and the selected driller had other work commitments during late September through early January 2011. A Notice of Intent (NOI) to proceed with the well decommissioning activities was submitted to the EPA and NYSDEC in August 2010. A copy of the NOI is provided in **Appendix B**.

The decommissioning of each well was addressed on an individual basis and the appropriate procedure was selected by the field geologist based upon the well's condition. The protective casing and its concrete pad, and if any bollards were present, were removed prior to well decommissioning. Personnel of Parsons and its subcontractor, GeoLogic NY decommissioned designated wells via one of two methods:

- Casing Pulling the well's bottom cap was punctured and then the well casing was pulled from the ground while the former well installation's void space was grouted by the tremmie pipe method with a Portland cement and Bentonite mixture as the casing was lifted. Once the well riser was removed, void space remaining at the ground surface was filled using either the remaining grout or the remaining grout covered with soil; or
- Grouting in Place the well's bottom cap was punctured and then the well casing was grouted from the bottom up by the tremmie pipe method with a Portland cement and Bentonite mixture. For wells grouted-in-place at SEAD-12 (MW12-35) and SEAD-25 (MW25-04D, MW25-07D, MW25-12D, MW25-14D, and MW25-16D), the concrete collar was removed, the protective casing and well upriser were cut off below grade at a level between 1 and 5 ft., and the level of grout in the upriser was topped off, and then the former well was covered with soil. MW71-1 and MW71-2 were initially constructed with roadway box completions and when the inner casing could not be pulled, the well riser and road box were filled with grout to grade surface.

Varying types of deep (i.e., bedrock) well installations were encountered in the Ash Landfill. In some cases (e.g., MW-35D, MW-38D, MW-41D, MW-42D, MW-49D, MW-51D, MW-54D, and MW-57D) and inner 2 inch PVC well screen and upriser was set in competent bedrock and was encased in an outer protective casing that extended from some depth below the competent/weathered shale interface to ground surface. In other cases (e.g., MW-50D, MW-52D, and MW-55D) and inner 2 inch PVC well screen and upriser was set in competent bedrock and was encased in an outer protective casing that extended from some depth below the competent/weathered shale interface to a level above ground surface. In either case, once the well screen was set in sand pack and the top seal was installed, the annulus between the inner and outer protective casing was then filled with a grout mixture. In the case of the former deep well installations, a cement/bentonite grout was used to fill the annular space, while in the latter installations (i.e., MW-50D, MW-52D, MW-55D), Volclay grout (bentonite only) was used to fill the annular space. Once the inner grout had been added, the wells were completed with protective collars, protective well uprisers, and locked covers.

The former wells (i.e., MW-35D, MW-38D, MW-41D, MW-42D, MW-49D, MW-51D, MW-54D, and MW-57D) were decommissioned by filling the inner well's screen and upriser

with a Portland cement and Bentonite mixture, removing the well's protective casing and concrete collar, topping off the grout level in the remaining well upriser and outer protective casing, and then filling the area around the decommissioned well with soil. For the other wells (i.e., MW-50D, MW-52D, MW-55D) the concrete collars were removed, the inner and other protective casing were cut off below grade level and removed, and then the location was covered with soil.

After the grout was brought to required level, the remaining space was backfilled with native material. A well decommission record was prepared for each well and is provided in **Appendix C**.

A general description of the well abandonment activities is provided in this section; details of specific well abandonment method used for each well is provided in **Table 1-2**. One hundred and twenty (120) of the 146 wells decommissioned were completed via casing pulling (grout, pull, grout – GPG), while seven had grout filled portions of the well left in place after they snapped during the casing pull (GPG/GIP).

- SEAD-13: 11 wells grouted, pulled casing, back grouted monitoring wells MW13-1 through MW13-7 and MW13-9 through MW13-12.
- SEADs-5, 59, and 71: seven wells grouted, pulled casing, back grouted monitoring wells MW5-2, MW59-1, MW59-2, MW59-4, MW59-7, MW59-8, MW71-3; pulling casing at one location resulted in part of the grout filled well screen/upriser to separate and be left in the back grouted hole monitoring well MW71-4.
- SEADs-12, 48, and 63: 38 wells grouted, pulled casing, back grouted monitoring wells MW12-01, MW12-02, MW12-04, MW12-06, MW12-09, MW12-16 through MW12-27, MW12-29 through MW12-32, MW12-38 through MW12-40, MW12A-02, MW12A-03, MW12B-01 through MWB-03, MW48-1 through MW48-6, MW48-8, and MW63-1 through MW63-3; pulling casing at three locations resulted in part of the grout filled well screen/upriser to separate and be left in the back grouted hole monitoring wells MW12-03, MW12-05, and MW48-7.
- SEADs-121C, 122B, and 70: eight wells grouted, pulled casing, back grouted –monitoring wells MW121C-3 through MW121C-6, MW-2 through MW-3, and MW70-1 and MW-70-4; pulling casing at one location resulted in part of the grout filled well screen/upriser to separate and be left in the back grouted hole monitoring wells MW-1 at SEAD-121B.
- SEADs-25 and 26: 11 wells grouted, pulled casing, back grouted monitoring wells Monitoring wells MW25-11, MW26-01 through MW26-08, MW26-10, and MW26-11.
- SEADs-24 and 67: six wells grouted, pulled casing, back grouted monitoring wells MW24-01 through MW24-03, and MW67-1through MW67-3.
- Ash Landfill: 16 wells grouted, pulled casing, back grouted monitoring wells MW-28, MW-30, MW-31, MW-33, MW-34, MW-36, MW-37, MW-43, MW-45, MW-47, MW-53, MW-59, MWT-11, PT-21A, PT-23, and PT-25; pulling casing at two locations resulted in part

of the grout filled well screen/upriser to separate and be left in the back grouted hole – monitoring wells PT-11 and PT-15.

- SEADs 119B and 27: five wells grouted, pulled casing, back grouted monitoring wells MW119B-1 through MW119B-3, MW-1 and MW-2.
- SEAD-4: nine wells grouted, pulled casing, back grouted monitoring wells MW4-1 through MW4-3, and MW4-5, MW4-7, MW4-9, MW4-11 through MW4-13.
- SEAD-11: seven wells grouted, pulled casing, back grouted monitoring wells MW11-1 through MW11-7.

The remaining wells were decommissioned by grouting in place. The list below summarizes the sites and wells that were decommissioned by grouting in place:

- SEADs-5, 59, and 71: Monitoring wells MW71-1 and MW71-2.
- SEADs-12, 48, and 63: Monitoring well MW12-35.
- SEADs-25 and 26: Monitoring wells MW25-04D, MW25-07D, MW25-12D, MW25-14D, and MW25-16D.
- Ash Landfill: Monitoring wells MW-35D, MW-38D, MW-41D, MW-42D, MW-49D, MW-50D, MW-51D, MW-52D, MW-54D, MW-55D, and MW-57D.

#### 3.3 WASTE GENERATION AND DISPOSAL

The solid waste generated during decommissioning activities included the protective steel casings, bollards, well pipe and screen, and concrete collars. The wastes were disposed as follows:

- No soil was recovered from any of the well installation locations. All soil disturbed around the decommissioned well sites was used as backfill at the location.
- All well installation debris, including protective steel casings, bollards, well pipe, and screen, and concrete collars (tare weight 16.38 tons) was disposed of as construction and demolition debris at a licensed landfill.

#### 4.0 SUMMARY

The "Well Decommissioning Work Plan" (Parsons August 2010) listed 182 groundwater monitoring wells for decommissioning, however, during the preliminary inspection 31 wells could not be found at their identified locations and are believed to have been decommissioned during other programs conducted at the Depot. One hundred forty-six (146 wells were decommissioned in accordance to the work plan (Parsons August 2010) and NYSDEC Groundwater Monitoring Well Decommissioning guidance document (January 2009).

Wells were abandoned via one of three methods:

- Casing Pulling the well's bottom cap was punctured, the well upriser was filled with grout and then the well casing was pulled from the ground while the former well installation's void space was grouted by the tremmie pipe method;
- Grouting in Place the well's bottom was punctured and the casing is grouted from the bottom up by the tremmie pipe method to approximately five feet bgs, the top five feet of casing and associated well materials is cut and removed from the ground; or
- Casing Pulling/Grout in Place Casing Pulling / Grout in Place Several of the wells that
  were selected for decommissioning by the grouting followed by casement pulling broke
  during the process. As a result, portions of the well casing and/or well screen were left in
  place, filled with grout and the remainder of the well annulus was overfilled with grout that
  was tremmied into place.

One hundred and twenty-seven (120 of the wells were decommissioned using the case pulling method, including seven in which a portion of the well screen/upriser broke off and was encased in the additional grout that was used to fill the vacant annular space of the vacated borehole. The remaining 19 wells were decommissioned by being grouted in place.

## Notes

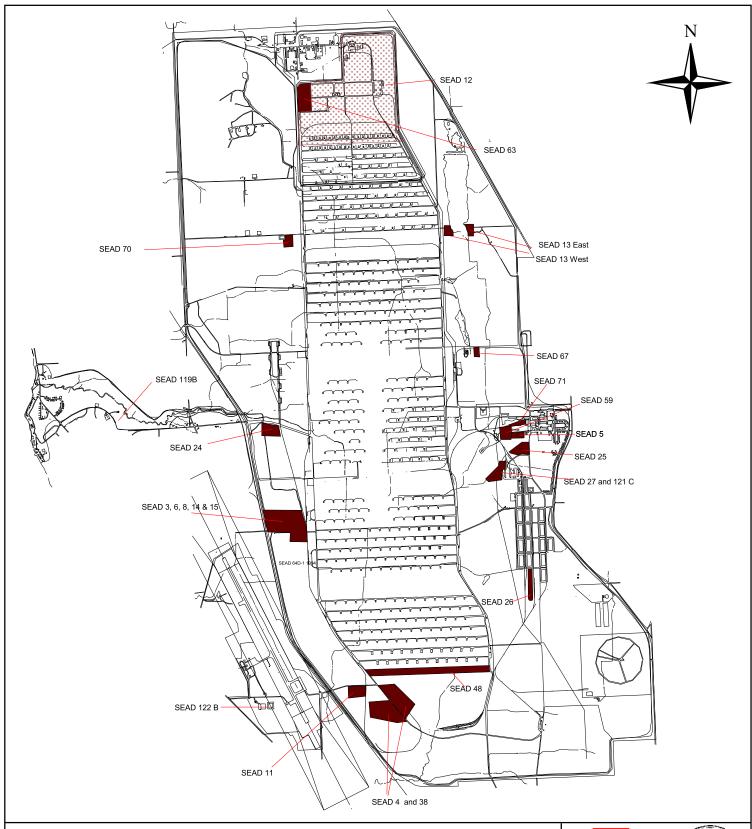

NA = Not avaiable.

<sup>1 -</sup> GIP = Grout in Plance. GPG = Grout, pull, grout. GPG/GIP = Grout, pull, a portion of well broke off during pull and was left in hole, grouted in place.

<sup>2 -</sup> ft

WELL:

mw 4-13

#### COMPLETION REPORT OF WELL No. MW5-1

PROJECT: EIGHT MODERATELY LOW PRIORITY AOCS

PROJECT LOCATION: SENECA ARMY DEPOT, ROMULUS NY

DRILLING CONTRACTOR: EMPIRE SOILS INVESTIGATIONS

DRILLING METHOD: HOLLOW STEM AUGER

WELL INSTALLATION STARTED: 03/16/94

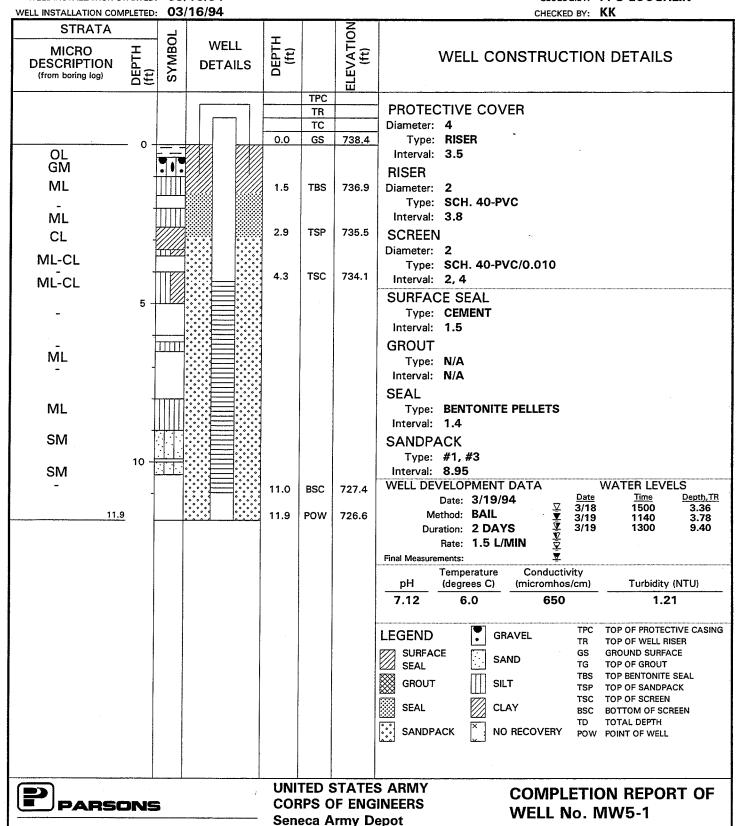

ENGINEERING-SCIENCE, INC.

WELL LOCATION (N/E): 998728.7 750506.4

REFERENCE COORDINATE SYSTEM: New York State Plane

GROUND SURFACE ELEVATION (ft): 738.4

**DATUM: NAD 1983** GEOLOGIST: F. O'LOUGHLIN

#### COMPLETION REPORT OF WELL No. MW5-2

PROJECT: EIGHT MODERATELY LOW PRIORITY AOCs

PROJECT LOCATION: SENECA ARMY DEPOT, ROMULUS NY

DRILLING CONTRACTOR: EMPIRE SOILS INVESTIGATIONS

DRILLING METHOD: HOLLOW STEM AUGER

WELL INSTALLATION STARTED: 03/04/94

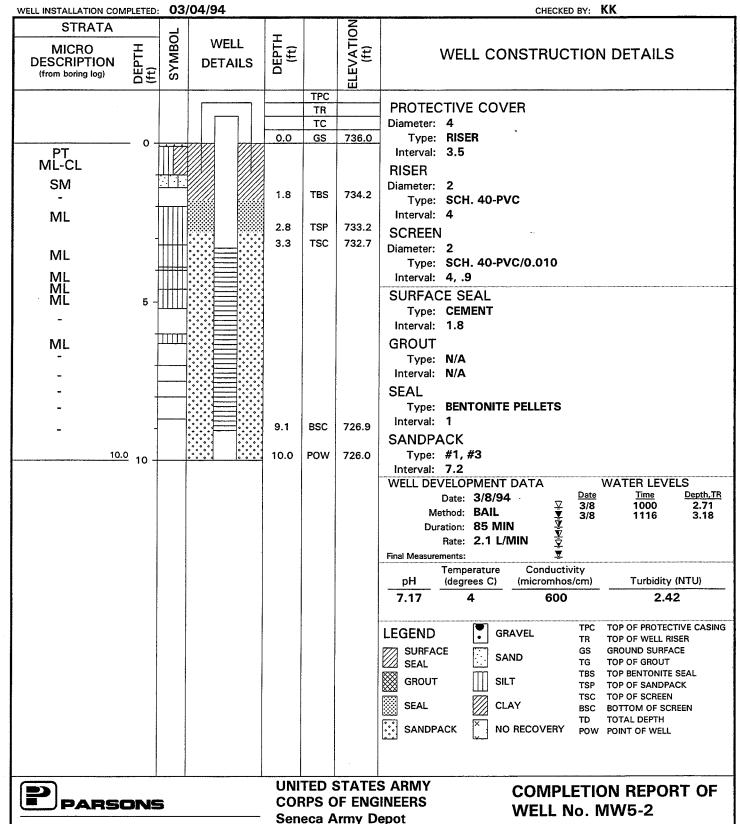

ENGINEERING-SCIENCE, INC.

WELL LOCATION (N/E): 998755.5 750226.3

REFERENCE COORDINATE SYSTEM: New York State Plane

GROUND SURFACE ELEVATION (ft): 736.0

**DATUM: NAD 1983** GEOLOGIST: F. O'LOUGHLIN

#### **COMPLETION REPORT OF WELL No. MW5-3**

PROJECT: EIGHT MODERATELY LOW PRIORITY AOCS

PROJECT LOCATION: SENECA ARMY DEPOT, ROMULUS NY

DRILLING CONTRACTOR: **EMPIRE SOILS INVESTIGATIONS** 

DRILLING METHOD: HOLLOW STEM AUGER

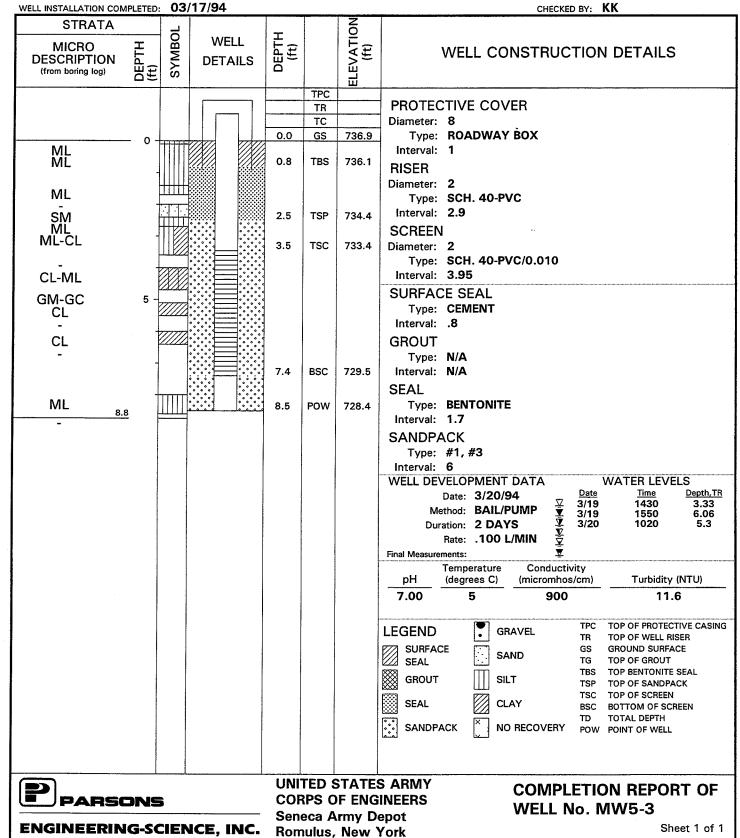

WELL INSTALLATION STARTED: 03/17/94

WELL LOCATION (N/E): 998884.9 750255.7

REFERENCE COORDINATE SYSTEM: NEW YORK STATE PLAN

GROUND SURFACE ELEVATION (ft): 736.9

DATUM: NAD 1983

SAMPLING METHOD

SS = SPLIT SPOON

A = AUGER CUTTINGS

C = CORED

Collected soil samples 134012 (0'-2') bgs and 134013 (8'-10') bgs for B/N/A SVOCs. TAL Metals. Cyanide, and Nitrate analysis. Also, collected duplicate soil sample 134020 (0'-2') bgs for same parameters mentioned above. Installed 2-inch monitoring well. In field notebook as SB/MW13-9 for work during August and September 2001

Seneca Army Depot

CHECKED BY: P.Feschbach-Meriney

### **COMPLETION REPORT OF WELL No. MW25-3**

PROJECT: SEAD-25 & SEAD-26 RI/FS

PROJECT LOCATION: Seneca Army Depot Activity, Romulus, NY 14541

WELL LOCATION (N/E): 998078.3 750926.3 GROUND SURFACE ELEVATION: 743.3

DRILLING CONTRACTOR: Empire Soils Investigation, Inc.

DATUM: NGVD 88

DRILLING METHOD: Hollow Stem Auger GEOLOGIST: E. Schacht

WELL INSTALLATION STARTED: 11/07/93 CHECKED BY:
WELL INSTALLATION COMPLETED: 11/07/93 CONSULTANT:

Seneca Army Depot Romulus, New York COMPLETION REPORT OF WELL No. MW25-3

PROJECT: SEAD-25 & SEAD-26 RI/FS

PROJECT LOCATION: Seneca Army Depot Activity, Romulus, NY 14541

WELL LOCATION (N/E): 998022.1 750983.2

GROUND SURFACE ELEVATION: 743.8

DRILLING CONTRACTOR: Empire Soils Investigation, Inc.

DATUM: NGVD 88

DRILLING METHOD: Rock Coring

GEOLOGIST: F. O'Loughlin

WELL INSTALLATION STARTED: 10/31/95

CHECKED BY: P.Feschbach-Meriney

WELL INSTALLATION COMPLETED: 10/31/95

PROJECT: SEAD-25 & SEAD-26 RI/FS

PROJECT LOCATION: Seneca Army Depot Activity, Romulus, NY 14541

WELL LOCATION (N/E): 998076.8 750856.9 GROUND SURFACE ELEVATION: 741.4

DRILLING CONTRACTOR: Empire Soils Investigation, Inc.

DATUM: NGVD 88

DRILLING METHOD: Hollow Stem Auger

GEOLOGIST: F. O'Loughlin

WELL INSTALLATION STARTED: 09/26/95

CHECKED BY: P.Feschbach-Meriney

WELL INSTALLATION COMPLETED: 09/26/95

CONSULTANT:

**ENGINEERING-SCIENCE, INC.** 

Seneca Army Depot Romulus, New York

WELL No. MW25-8

PROJECT: SEAD-25 & SEAD-26 RI/FS

PROJECT LOCATION: Seneca Army Depot Activity, Romulus, NY 14541

WELL LOCATION (N/E): 998005.3 750898.1

DRILLING CONTRACTOR: Empire Soils Investigation, Inc.

DRILLING METHOD: Hollow Stem Auger

WELL INSTALLATION STARTED: 09/26/95

WELL INSTALLATION COMPLETED: 09/26/95

GROUND SURFACE ELEVATION: 741.3

DATUM: NGVD 88

GEOLOGIST: F. O'Loughlin

CHECKED BY: P.Feschbach-Meriney

Seneca Army Depot Romulus, New York COMPLETION REPORT OF WELL No. MW25-9

PROJECT: SEAD-25 & SEAD-26 RI/FS

PROJECT LOCATION: Seneca Army Depot Activity, Romulus, NY 14541

WELL LOCATION (N/E): 997965.0 751000.0

DRILLING CONTRACTOR: Empire Soils Investigation, Inc.

DRILLING METHOD: Hollow Stem Auger

WELL INSTALLATION STARTED: 09/27/95

GROUND SURFACE ELEVATION: 741.8

DATUM: NGVD 88

GEOLOGIST: F. O'Loughlin

CHECKED BY: P.Feschbach-Meriney

**ENGINEERING-SCIENCE, INC.** 

Seneca Army Depot Romulus, New York

**WELL No. MW26-10** 

PROJECT: SEAD-25 & SEAD-26 RI/FS

PROJECT LOCATION: Seneca Army Depot Activity, Romulus, NY 14541

WELL LOCATION (N/E): 992690.3 751235.7

DRILLING CONTRACTOR: Empire Soils Investigation, Inc.

DRILLING METHOD: Hollow Stem Auger

WELL INSTALLATION STARTED: 10/19/95 WELL INSTALLATION COMPLETED: 10/19/95

GROUND SURFACE ELEVATION: 754.9

DATUM: NGVD 88

GEOLOGIST: F. O'Loughlin

CHECKED BY: P.Feschbach-Meriney

PROJECT: EIGHT MODERATELY LOW PRIORITY AOCS

PROJECT LOCATION: SENECA ARMY DEPOT, ROMULUS NY

DRILLING METHOD: HOLLOW STEM AUGER

WELL INSTALLATION STARTED: 03/18/94

ENGINEERING-SCIENCE, INC.

DRILLING CONTRACTOR: EMPIRE SOILS INVESTIGATIONS

REFERENCE COORDINATE SYSTEM: New York State Plane

WELL LOCATION (N/E): 998909.7 749948.8

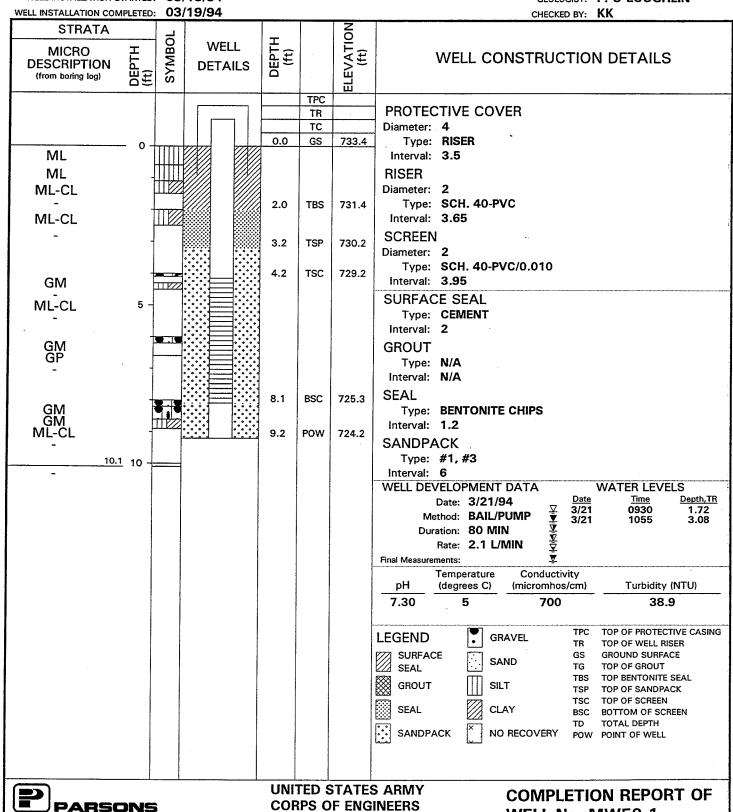

GROUND SURFACE ELEVATION (ft): 733.4

**DATUM: NAD 1983** 

GEOLOGIST: F. O'LOUGHLIN

WELL No. MW59-1
