Mr. John Nohrstedt
U.S. Army Corps of Engineers
Engineering and Support Center, Huntsville
Attn: CEHNC-ED-CS-P
4820 University Square
Huntsville, Alabama 35816-1822

SUBJECT: Signed Final Record of Decision for the Fill Area West of Building 135 (SEAD-59) and the Alleged Paint Disposal Area (SEAD-71) at Seneca Army Depot Activity; Contract DACA87-02-D-0005, Delivery Order 0013

Dear Mr. Nohrstedt:

Parsons Infrastructure & Technology Group Inc. (Parsons) is pleased to submit the signed Final Record of Decision for the Fill Area West of Building 135 (SEAD-59) and the Alleged Paint Disposal Area (SEAD-71) located at the Seneca Army Depot Activity (SEDA) in Seneca County, New York. This work was performed in accordance with the Scope of Work (SOW) for Delivery Order 0013 under Contract No. DACA87-02-D-0005.

Parsons appreciates the opportunity to provide you with the Record of Decision for this work. Should you have any questions, please do not hesitate to call me at (617) 449-1405 to discuss them.

Sincerely,

Todd Heino, P.E.
Project Manager

1.0 DECLARATION OF THE RECORD OF DECISION

Areas of Concern Name and Location

The Fill Area West of Building 135 (SEAD-59) and the Alleged Paint Disposal Area (SEAD-71)

Seneca Army Depot Activity

5786 State Route 96

Romulus, New York 14541

USEPA Site ID: NY0213820830; NY Site ID: 8-50-006

Statement of Basis and Purpose

This Record of Decision (ROD) documents the U.S. Army's (Army's) and the U.S. Environmental Protection Agency's (USEPA's) selected remedies for the Fill Area West of Building 135 (SEAD-59) and the Alleged Paint Disposal Area (SEAD-71) located at the Seneca Army Depot Activity (SEDA or the Depot) in the Towns of Varick and Romulus, Seneca County, New York. The decisions for these two areas of concern (AOCs) were developed in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) as amended, 42 U.S.C. Section 9601, *et seq.* and, to the extent practicable, the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), 40 CFR Part 300. The Base Realignment and Closure (BRAC) Environmental Coordinator, the Chief, Consolidations Branch, BRAC Division, and the USEPA Region II have been delegated the authority to approve this Record of Decision (ROD).

This ROD is based on the Administrative Record that has been developed in accordance with Section 113(k) of CERCLA. The Administrative Record is available for public review at the Seneca Army Depot Activity, 5786 State Route 96, Building 123, Romulus, NY 14541. The Administrative Record Index identifies each of the items considered during the selection of the remedial actions. This index is included in **Appendix A**.

The State of New York, through the New York State Department of Environmental Conservation (NYSDEC), has concurred with the selected remedies. The NYSDEC Declaration of Concurrence is provided in **Appendix B** of this ROD.

AOC Assessment

The response actions selected in this ROD are necessary to protect human health and the environment from actual or threatened releases of hazardous substances into the environment from SEAD-59 and SEAD-71 or from actual or threatened releases of pollutants or contaminants, which may present an imminent and substantial endangerment to public health or welfare.

Description of the Selected Remedies

The selected remedies for SEAD-59 and SEAD-71 address contaminated soil and groundwater. The selected remedies will result in the removal of soil and groundwater as exposure pathways for potential receptors.

The elements that compose the selected remedies at SEAD-59 and SEAD-71 include:

- Establish, monitor, and maintain land use controls (LUCs) that:
 - Prohibit access to or use of the groundwater until unrestricted use and unlimited exposure criteria are attained; and,
 - Prohibit the development or use of the property for residential housing, elementary and secondary schools, childcare facilities and playgrounds until unrestricted use and unlimited exposure criteria are attained at SEAD-59 and SEAD-71.

Soils excavated from SEAD-59 and SEAD-71 that remain staged in stockpiles in the vicinity of the two AOCs will be moved to SEAD-5 where they will continue to be managed by the Army. Although these soils contain measureable concentrations of hazardous substances, they are not hazardous by characteristic determinations (i.e., toxicity characteristic, ignitability, corrosivity, reactivity). It is possible that the stockpiled soil will subsequently be used as part of a multi-layered cap that may be constructed over SEAD-5 soil to address conditions that have been identified at that AOC.

SEAD-59 and SEAD-71 represent a small portion of a larger tract of land located in the east-central portion of the former SEDA that comprises the Planned Industrial / Office Development and Warehousing (PID) Area that has been transferred to the Seneca County Industrial Development Agency (SCIDA), exclusive of any Army retained property. Based on an agreement reached between the Army, the USEPA, and the NYSDEC, the entire PID Area, exclusive of Army retained property, is subject to equivalent LUCs (i.e., prohibit groundwater access/use; prohibit residential housing/elementary and secondary schools/childcare facilities/playgrounds) as are proposed for imposition at SEAD-59 and SEAD-71 in this ROD. The referenced LUCs were the remedy selected in a 2004 ROD [*Final ROD for Sites Requiring Institutional Controls in the Planned Industrial/Office Development or Warehousing Areas* (Parsons, 2004)] for SEAD 27, 64A, and 66, three other AOCs within the PID Area, due to levels of contaminants that were identified at those AOCs. At the time of the 2004 ROD, the Army, USEPA, and NYSDEC agreed that these LUCs should be applied to all land within the greater PID Area, pending the provision and evaluation of new data for specific sites within the PID Area if a future owner or occupant wished to apply for a variance from the specified LUCs. The PID Area LUCs were implemented when the PID Area was transferred to the SCIDA by the Army, but they are not applied to the land comprising SEAD-59 and SEAD-71, as these parcels were retained by the Army at the time of the greater PID Area's transfer, pending completion of necessary investigations and studies, the evaluation of potential remedial actions, and the selection of an approved remedy for SEAD-59 and SEAD-71.

The Army shall, through the on-site Commander's representative or other designated official, implement, inspect, report on, and enforce the remedy described in this ROD. This ROD selects as the remedy for SEAD-59 and SEAD-71 LUCs (i.e., groundwater access/use and land use limitations) to be imposed by an environmental easement at the time when land comprising SEAD-59 or SEAD-71 is transferred from Army ownership to another party, as well as the prohibition of any pre-transfer use inconsistent with the LUCs. Although the Army may later transfer these responsibilities to another party, the Army shall retain ultimate responsibility for remedy integrity.

To implement the remedies selected in this Record of Decision, which will include the imposition of LUCs at SEAD-59 and SEAD-71, a LUC Remedial Design will be prepared which will provide for the recording of an environmental easement which is consistent with Paragraphs (a) and (c) of the New York State Environmental Conservation Law (ECL) Article 27, Section 1318: Institutional and Engineering Controls. In addition, the Army will prepare an environmental easement for SEAD-59 and SEAD-71, consistent with Section 27-1318(b) and Article 71, Title 36 of ECL, in favor of the State of New York, which will be recorded at the time of the property's transfer from Federal ownership and which will require the owner and/or any person responsible for implementing the LUCs set forth in this ROD to periodically certify that such institutional controls are in place. The Army and the USEPA will be named as third-party beneficiaries on the environmental easement. A schedule for completion of the draft SEAD-59 and SEAD-71 LUC Remedial Design Plan (LUC RD) will be completed within 21 days of the ROD signature, consistent with Section 14.4 of the Federal Facilities Agreement (FFA). To implement the remedy prior to transfer, the Army, as the owner and operator of the property at SEAD-59 and SEAD-71, will through the on-site Commander's representative or other designated official, ensure that the LUCs are implemented by monitoring the property at SEAD 59 and SEAD 71 and restricting development or use on this property if inconsistent with the LUCs.

Once the selected remedies are applied, a review of the selected remedies will be made at least once every five years in accordance with Section 121(c) of the CERCLA. The periodic reviews of the remedies are required by CERCLA at sites where contamination remains in order to assure the protectiveness of the selected remedy.

The groundwater access/use restriction and the restriction prohibiting residential housing, elementary and secondary schools, childcare facilities and playgrounds may be eliminated, on a site-by-site basis, if data is provided to, and approved by, the Army, USEPA, and the NYSDEC that documents that groundwater quality achieves applicable groundwater standard levels and that soil data allows for unrestricted use and unlimited exposures.

The Army and USEPA expect that remedial action will be needed at SEAD-5 to address soils currently in the ground at that AOC that represent a potential risk to human health. One of the potential remedial actions that may be taken at SEAD-5 is to spread the stockpiled soils staged at SEAD-59 out over soils in SEAD-5 that pose the potential threat. The stockpiled soil would become part of a multi-layered cover that would be placed over the contaminated soil to prohibit access and exposure to future users or occupants. The SEAD-5 remedial action would be followed by the imposition of a LUC to restrict allowable activities at that AOC, and an imposition of a LUC to protect the soil cover and the demarcation fabric above such interred soils. The remedial action for SEAD-5 will be addressed in a separate Record of Decision to be issued pursuant to CERCLA for that AOC.

State Concurrence

NYSDEC forwarded to USEPA a letter of concurrence regarding the selection of a remedial action in the future. This letter of concurrence has been placed in **Appendix B**.

Declaration

As required by CERCLA and the NCP, the remedies selected in this ROD are protective of human health and the environment; are cost effective; comply, unless waived, with applicable or relevant and appropriate requirements, criteria or limitations promulgated under federal or state laws (ARARs); and use permanent solutions, alternative treatment technologies, and resource recovery options to the maximum extent possible. CERCLA and the NCP also state a preference for treatment as a principal element for the reduction of toxicity, mobility, or volume of the hazardous substances.

The remedies identified will result in hazardous substances and pollutants or contaminants remaining on-site above levels that allow for unlimited use and unrestricted exposure for an indeterminate period. A review of the AOCs and the selected remedies will be conducted within five years after initiation of the remedial action at each AOC to ensure that the remedy is, or will be, protective of human health and the environment, with consideration given to each AOC's continuing and planned future use.

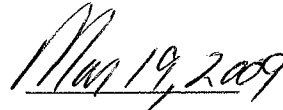

The estimated cost for implementing, monitoring, assessing and reporting on the continued suitability of the recommended land use restrictions is \$149,460 for SEAD-59 and \$74,460 for SEAD-71 over a 30-year period. The total combined estimated cost of the selected remedial actions at both areas of concern included in this ROD is \$223,920.

The foregoing represents the selection of a remedial action by the U.S. Department of the Army and the U.S. Environmental Protection Agency, with the concurrence of the New York State Department of Environmental Conservation.

Concur and recommend for immediate implementation:

STEPHEN M. ABSOLOM
BRAC Environmental Coordinator

2.0 AOC NAME, LOCATION, AND DESCRIPTION

The Seneca Army Depot previously occupied approximately 10,600 acres of land in Seneca County in the Towns of Romulus and Varick, New York. The property was acquired by the United States Government in 1941, and was operated by the Department of the Army from that time until approximately September 2000 when the installation closed. Prior to the acquisition of the land and the construction of the Depot, the land was used for agriculture, farming, and residential purposes.

A location map for SEDA is provided as **Figure 2-1**. **Figure 2-1** also shows that SEDA is bordered by New York State Highway 96 on the east and New York State Highway 96A on the west. SEDA is located in an uplands area, which forms a divide that separates two of New York's Finger Lakes; Cayuga Lake on the east and Seneca Lake on the west. Ground surface elevations are generally higher along the eastern and southern borders of the Depot, and lower along the northern and western borders. The approximate elevation at the southeastern corner of the SEDA site is 740 feet (ft., National Geodetic Vertical Datum [NGVD] 1929), while the approximate elevation at the southwestern and northeastern corners is 650 ft. (NGVD, 1929). The approximate elevation at the southwestern corner of the Depot is 590 ft. (NGVD, 1929). Much of the land surrounding the Depot is sparsely populated farmland.

The Fill Area West of Building 135 (SEAD-59) and the Alleged Paint Disposal Area (SEAD-71) are located in the east-central portion of the former SEDA. Both of these AOCs are located in a portion of the former Depot that has been designated by the SCIDA as the PID Area where the future land use is designated as industrial and commercial purposes. Portions of the PID Area are currently occupied by private commercial and light industrial operations.

A site plan for SEAD-59 is shown as **Figure 2-2**. SEAD-59 (Fill Area West of Building 135) is approximately 6.2 acres in size and encompasses an area located along both sides of an unnamed east-west dirt road that provides access to Building 311 for the Depot's former Administration Area and terminates at Building 311. The entire western border of SEAD-59 is defined by a north-south trending drainage ditch. An east-west oriented drainage swale that parallels the SEDA railroad tracks forms the northern boundary of SEAD-59. Drainage ditches are also located on each side of the dirt access road to Building 311.

SEAD-59 was used for the disposal of construction debris and oily sludge. SEDA personnel have also indicated the area of SEAD-59 was used as the Army's version of a local Department of Public Works (DPW) yard where vehicles and materials were staged, and as a result a large quantity of miscellaneous "roads and grounds" debris remains, and has become intermixed with the native soils. Finally, results of test pitting operations (See Section 3.3 of Final SEAD-59 and 71 Phase I Remedial Investigation (RI) Report [Parsons, 2001]) completed during site investigation activities indicate that full and empty 15- and 55-gallon drums, one-, two- and five-gallon paint cans, 20-gallon waste cans, and chain-linked fence were also found buried at the site.

A site plan for SEAD-71 is shown as **Figure 2-3**. SEAD-71 (the Alleged Paint Disposal Area) is wedge shaped and is located west of 4th Avenue near Buildings 114 and 127. The entire AOC is approximately

2.4 acres in size and bounded on the north and south by railroad tracks serving Buildings 114 and 127. The topography is relatively flat with a gentle slope to the southwest.

The blunt end of the wedge-shaped AOC (i.e., eastern side) is surrounded by a chain-link fence and which is hereafter referred to as the "Fenced Area." The Fenced Area is situated between Buildings 114 and 127 and is bisected by a single east-west railroad track. The Fenced Area is generally paved or covered with a mixture of crushed stone and broken asphalt. Pieces of asphalt and concrete can be observed on the ground surface within the Fenced Area. Additional east-west trending railroad tracks are located between the southern edge of Building 114 and the northern bound of the Fenced Area and between the northern edge of Building 127 and the southern bound of the Fenced Area. The sharp side of the wedge-shaped AOC (i.e., western side) is a grassy area that is interrupted by a gravel roadway that enters from the north, turns westerly, and then exits the AOC to the south. The storage areas north and east of SEAD-71 contain numerous white transformers, large spools of cable, and other assorted equipment.

Prior to the RI, rumors suggest that paints and/or solvents were disposed at SEAD-71 in burial pits. The results of the RI test pitting operations failed to confirm the paint and oil disposal rumors, but did indicate that the area had been used for the disposal of construction debris, including sheet metal, asphalt, chain link fencing, sand and stone, piping, railroad ties, wood and cinders. No dates of disposal are available nor is there any information on the number of suspected disposal pits that may have been used.

Habitat and Ecological Community Characterization

AOC-specific ecological evaluations of the plant and animal habitats and communities located at SEAD-59 and SEAD-71 were not conducted. The AOCs are generally void of characteristics and attributes that would make them an attractive habitat for most ecological receptors. As is indicated above, SEAD-59 encompasses an area along both sides of an unnamed access road. The area to the north was excavated and backfilled during the 2002 time-critical removal action (TCRA) (ENSR, 2002a)¹. The area to the south is covered with vegetation. Several areas to the south of the unnamed road were excavated and backfilled during the 2002 TCRA (ENSR, 2002a). There are several drainage swales on the western and northern border of the AOC and on each side of the access road.

SEAD-71 is bounded by railroad tracks and a chain-link fence. The Fenced Area situated between Buildings 114 and 127 is surrounded by a chain-link fence and the area is generally paved over or covered with crushed stone. The west portion of SEAD-71 is a grassy area that is interrupted by a gravel roadway.

Characterizations of the habitat and ecological communities present near, but exterior of, SEAD-59 and SEAD-71 are based on general observations made during the 1994 Expanded Site Inspections (ESIs), the 1997 Phase I RI, and the 2004 groundwater monitoring, and on the results of the ecological evaluations and assessment that have been conducted at other solid waste management units (SWMUs) at the SEDA [e.g., SEADs 4, 12, 16, 17, 25 and 26, and the Open Burning (OB) Grounds] as part of remedial investigations. SEADs 16, 17, 25 and 26 are also located within the greater PID Area, in close proximity

¹ Refer to *Final Draft – Removal Report, SEAD-59 and 71 Time Critical Removal Action, Seneca Army Depot Activity*, ENSR Corporation, December 2002 (ENSR, 2002). Additional discussion pertinent to the TCRA is provided in Section 3.1 and 6.1.2 of this Record of Decision.

to SEAD-59 and SEAD-71. Key aspects of these characterizations relevant to this risk assessment are presented below.

The methods used to characterize the ecological resources included AOC- and area-walkovers for the evaluation of existing wildlife and vegetative communities; interviews with local, state, and SEDA resource personnel; and review of environmental data obtained from previous Army reports. SEDA has a strong wildlife management program that is reviewed and approved by the New York State Division of Fish, Wildlife and Marine Resources. The Depot manages an annual white-tailed deer (*Odocoileus virginiana*) harvest and has constructed a large wetland called the "Duck Pond" in the northeastern portion of the facility to provide a habitat for migrating waterfowl.

The NYSDEC Natural Heritage Program Biological and Conservation Data System identifies no known occurrences of federal- or state-designated threatened or endangered plant or animal species within a 2-mile radius of SEAD-59 or SEAD-71. No species of special concern are documented within the Depot property.

The only significant terrestrial resource known to occur at SEDA is the population of white-pelaged white-tailed deer, which inhabits the fenced portion of the Depot, west of the PID area. Annual deer counting conducted at the Depot indicates that the size of the deer herd is approximately 600 animals of which approximately one-third (i.e., 200) are white-pelaged. Since the perimeter of the Depot is totally enclosed by fence, the white-pelaged deer is thought to result from inbreeding within the herd. The Depot maintains the herd through an annual hunting season to prevent overgrazing and starvation of the deer. The management plan of the herd is conducted by the New York State Division of Fish, Wildlife, and Marine Resources. The normal brown-pelaged deer are also common. White-tailed deer are not listed as a rare or endangered species.

Agricultural crops and deciduous forests comprise the vegetative resources used by humans near SEDA. Although no crops are grown at the Depot, farmland is the predominant land use of the surrounding private lands. Crops including corn, wheat, oats, beans and hay mixtures, are grown primarily for livestock feed. Deciduous forestland on the Depot and surrounding private lands is under active forest management. Timber and firewood are harvested from private woodlots that surround the Depot, but timber harvesting does not occur on the Depot.

Vegetation across the SEDA consists of successional old field, successional shrub, and successional hardwoods. The NYSDEC Natural Heritage Program Biological and Conservation Data System identifies no known occurrences of federal- or state-designated threatened or endangered plant. No species of special concern are documented within the Depot property. No rare or endangered species were observed during the site assessments.

Several wildlife species are hunted and trapped on private lands near SEDA. Game species hunted include the eastern cottontail, white-tailed deer, ruffed grouse, ring-necked pheasant, and various waterfowl. Gray squirrel and wild turkey are hunted to a lesser extent. At the Depot, deer, waterfowl, and small game hunting are allowed. Trapping is also permitted on the Depot.

Animals that have been identified at the Depot during various ecological surveys include the beaver, eastern coyote, deer, red and gray fox, eastern cottontail rabbit, muskrat, raccoon, gray squirrel, striped skunk, and the woodchuck. Bird species that have been identified include the blue jay, black-capped chickadee, American crow, mourning dove, northern flicker, ruffed grouse, ring-billed gull, red-tailed hawk, northern junco, American kestrel, white breasted nuthatch, ring-necked pheasant, American robin, eastern starling, turkey vulture, and pileated woodpecker.

There are no permanent lakes, ponds, streams or wetlands in either SEAD-59 or SEAD-71. Surface water only exists intermittently in drainage ditches; thus, it does not directly support aquatic life.

No signs of stressed or altered terrestrial biota (vegetation and wildlife species) were observed at either SEAD-59 or SEAD-71. There were no indications of unnatural die-off or stunted vegetation.

3.0 SITE HISTORY AND ENFORCEMENT ACTIVITIES

3.1 LAND USE

Prior to the acquisition of the land and construction of SEDA in 1941, the property was privately owned and was used principally as homesteads and for agriculture. Between 1941 and 2000, SEDA was owned by the United States Government and operated by the Department of the Army. The Depot began its primary mission of receipt, maintenance and supply of ammunition in 1943. After the end of World War II, the Depot's mission shifted from supply to storage, maintenance and disposal of ammunition. SEDA was selected for closure by the Department of Defense (DoD) in 1995, and SEDA's military mission terminated in September 1999 and the installation was closed in September 2000.

To address employment and economic impacts associated with the SEDA's closure, the Seneca County Board of Supervisors established the Seneca Army Depot Local Redevelopment Authority (LRA) in October 1995. The primary responsibility assigned to the LRA was to prepare a plan for redevelopment of the SEDA property. Following a comprehensive planning process, a *Reuse Plan and Implementation Strategy for Seneca Army Depot* (RKG Associates, 1996) was completed and adopted by the LRA on October 8, 1996. The Seneca County Board of Supervisors subsequently approved this *Reuse Plan* on October 22, 1996. In 2005, the Seneca County Industrial Development Authority (SCIDA) changed the planned use of land in many portions of the Depot. **Figure 3-1** depicts the intended future land uses for SEDA, as modified by the SCIDA. As indicated on **Figure 3-1**, the proposed future land use for SEAD-59 and SEAD-71 is for Planned Industrial/Office Development or Warehousing.

Land within the Planned Industrial/Office-Development and Warehousing (PID) area is subject to LUCs that prohibit the use of the land for residential activities and that prohibit access to, and use of, groundwater. These LUCs were implemented on the PID Area via a separate Proposed Plan and ROD, [*Final ROD for Sites Requiring Institutional Controls in the Planned Industrial/Office Development or Warehousing Areas* (Parsons, 2004) signed on September 30, 2004].

3.2 RESPONSE AND ENFORCEMENT HISTORY

SEDA was proposed for the National Priorities List (NPL) in July 1989. In August 1990, the listing of SEDA as a NPL site was finalized in Group 14 on the Federal Section. After SEDA was listed on the NPL, the Army, USEPA, and NYSDEC identified 57 SWMUs where data or information suggested, or evidence existed to support, that hazardous substances or hazardous wastes had been handled and where releases to the environment may have occurred. Additionally, the USEPA, NYSDEC, and the Army negotiated and finalized a Federal Facilities Agreement (FFA, USEPA, Army and NYSDEC, 1993) for the Site in 1993. The general purposes of the FFA were to:

- *“Ensure that the environmental impacts associated with past and present activities at the Site are thoroughly investigated and that appropriate remedial action is taken as necessary to protect human health and the environment;*
- *Establish a procedural framework and schedule for developing, implementing and monitoring appropriate response actions at the Site in accordance with CERCLA, the NCP, Superfund guidance and policy, RCRA, RCRA guidance and policy and applicable State law; and*

- *Facilitate cooperation, exchange of information and participation of the Parties in such actions.”²*

The number of SWMUs was subsequently expanded to include 72 AOCs once the Army finalized the *SWMU Classification Report* (Parsons, 1994) for the Depot in 1994.

The SEDA was a generator and treatment, storage and disposal facility (TSDF) for hazardous wastes and thus, subject to regulation under the Resource Conservation and Recovery Act (RCRA). Under the RCRA permit system, corrective action is required at all SWMUs, as needed. Remedial goals are the same for CERCLA and RCRA; thus, once the 72 SWMUs were listed, the Army recommended that they be identified as either areas requiring No Action or as AOCs, where additional; investigation, study, or actions were needed. SWMUs listed as AOCs were then scheduled for investigations based upon data and potential risks to the environment.

In October 1995, the SEDA was designated for closure under the DoD’s 1995 Base Realignment and Closure (BRAC) process. In accordance with requirements of BRAC, the Army performed and summarized the findings of an Environmental Baseline Survey (EBS) for SEDA. Under the EBS, all areas at the Depot were evaluated and subdivided into one of seven standard environmental categories consistent with the Community Environmental Response Facilitation Act (CERFA – Public Law 102-426) guidance and the DoD’s *BRAC Cleanup Plan Guidebook* (DoD, 1993). Based on the findings and conclusions of the EBS, SEAD-59 and SEAD-71 were both designated as AOCs where additional information and data were required before the land could be offered for transfer and reuse.

Once SEDA was added to the 1995 BRAC list, the Army’s primary objective expanded from performing remedial investigations and completing necessary remedial actions to include the release of non-affected portions of the Depot to the surrounding community for their reuse for other, non-military purposes (i.e., industrial, municipal, and residential). The designated future use of land within the SEDA was first defined and approved by the Seneca County Local Redevelopment Authority in 1996. The planned use for portions of the SEDA was modified by SCIDA in 2005.

Prior investigations and interim remedial actions at SEAD-59 and SEAD-71 have consistently been conducted concurrently as separate components of larger contracts. Work performed at both AOCs includes the ESIs in 1994, Phase I RIs in 1997, Time Critical Removal Actions (TCRAs) conducted in 2002, and Phase II RIs completed in 2006.

The ESIs performed in 1994 included geophysical investigations, soil investigations (including soil boring and test pitting), and groundwater monitoring well installation and sampling. The 1997 Phase I RI conducted at SEAD-59 included a soil gas survey, a geophysical survey, a test pitting program, a soil boring investigation, and groundwater monitoring well installation; the Phase I RI conducted at SEAD-71 included a ground penetrating radar survey, a surface soil investigation, and a test pitting program. The TCRAs performed in 2002 included excavation and staging of impacted soils, sampling and analysis of excavated areas and stockpiled excavated soils, disposal of approximately 3,805 tons of contaminated soil at an approved off-site landfill, installation of groundwater monitoring wells, and backfilling and grading

² Federal Facility Agreement under CERCLA Section 120 in the Matter of Seneca Army Depot, Romulus, New York, Docket Number: II-CERCLA-FFA-00202, Section 3, Page 4, January 1993.

of open excavations with acceptable soil from the stockpiles. For both AOCs, the Phase II RIs included validating and evaluating the soil data generated during the 2002 TCRAs, conducting groundwater monitoring, and performing risk assessments to characterize potential residual risks to human health and the environment.

The previous work is described in detail in the following reports:

- *Expanded Site Inspection Seven Low Priority AOCs SEADs 60, 62, 63, 64 (A, B, C, and D), 67, 70, and 71*(Parsons, 1995a);
- *Expanded Site Inspection Eight Moderately Low Priority AOCs SEADs 5, 9, 12 (A and B), (43, 56, 69), 44 (A and B), 50, 58, and 59* (Parsons, 1995b);
- *Revised Final Phase I Remedial Investigation (RI) Report for SEAD-59 and SEAD-7* (Parsons 2002c)1;
- *Final Draft Removal Report, SEAD-59 and 71 Time Critical Removal Action* (ENSR, 2002); and
- *Draft Final Phase II Remedial Investigation Report for SEAD-59 and SEAD-71*.

4.0 COMMUNITY PARTICIPATION

The Army, EPA, and NYSDEC rely on public input to ensure that community concerns are considered in selecting an effective remedy for each Superfund site. To this end, the RI/FS Report, the Construction Completion Report, the Proposed Plan and the supporting documentation have been made available to the public for a public comment period, which began on December 10, 2007 and concluded on February 08, 2008. Copies of the RI/FS Reports, the Time-Critical Removal Action Report, the Proposed Plan, the Record of Decision, and supporting documentation are available at the following repository:

Seneca Army Depot Activity

Building 123

Romulus, NY 14541

(607) 869-1309

Hours are Mon-Thurs 8:30 am to 4:30 pm

A public meeting was held during the public comment period at the Seneca County Office Building on December 12, 2007 at 7 p.m. to present the conclusions of the RIs and the interim removal actions (i.e., TCRA) to elaborate further on the reasons for recommending the preferred remedial option, and to receive public comments. Comments received at the public meeting, as well as written comments, are documented in the Responsiveness Summary Section of the ROD, **Appendix C**.

The primary responsibility assigned to the LRA was the preparation of a plan for the redevelopment of the Depot. During the BRAC process, monthly presentations have been given to the LRA. In addition, the SEDA Restoration Advisory Board (RAB) was established to facilitate the exchange of information between SEDA and the community. RAB members include the representatives from the Army, USEPA, NYSDEC, NYSDOH, and the community. After a comprehensive planning process, a Reuse Plan and Implementation Strategy for Seneca Army Depot was completed and adopted by the LRA on October 8, 1996. The Reuse Plan was subsequently approved by the Seneca County Board of Supervisors on October 22, 1996. The planned uses for portions of the SEDA have been modified by the SCIDA since 1996. The identified use for the land including SEAD-59 and SEAD-71 remained unchanged, and is Planned Industrial / Office Development.

During the BRAC process there have been, and continue to be, periodic presentations to the RAB regarding the progress of SEAD-59 and SEAD-71 and other investigations related to the closure of SEDA.

5.0 SCOPE AND ROLE

The Army's ultimate goal for SEDA is to transfer the entire site to other private or public parties for beneficial reuse. Prior to the transfer of any property at the Depot, the Army is required to ensure that the property is suitable for release and reuse at a level that is consistent with its intended foreseeable future use. If information or evidence exists to indicate that hazardous substances may be present at any location slated for transfer, the Army is obligated to conduct investigations needed to verify the presence/absence of hazardous substances, and assess the potential risks that may exist due to the presence of hazardous substances at the site. These investigations and assessments are conducted under the oversight of, and subject to the review and approval of the USEPA and the NYSDEC. The findings, results, and the conclusions of the investigations and assessments, and the subsequent land use decisions that are made based on the Army's investigations and assessments are also made available to the public for review and comment.

If the results and conclusions of the investigations and assessments of property at the SEDA indicate that unacceptable risks to human health or the environment exist due to the continuing presence of hazardous substances, the Army is obligated to propose, design, implement, monitor, inspect and report on the remedial actions used to eliminate, mitigate or control the threat. The remedial actions are also subject to review and approval by all parties.

Once the Army is able to demonstrate, and gain oversight agency concurrence, that a site is suitable for transfer, such transfer may be approved and allowed.

SEAD-59, the Fill Area West of Building 135, and SEAD-71 are designated AOCs that are located in the PID Area at the former SEDA. The Army is currently leasing other property located in the PID Area to outside parties for reuse as warehousing, commercial use and light industrial operation property. It is the Army's goal to demonstrate that SEAD-59 and SEAD-71 are available for reuse, via transfer to other public or private parties for similar purposes.

Results of the human health risk assessment conducted for SEAD-59 indicate that carcinogenic risks resulting from potential exposure to in-situ (i.e., in place in the ground) soil, stockpiled soil, and groundwater are within USEPA's acceptable limit (i.e., lower than 1×10^{-4}). The total non-cancer hazard index for the adolescent trespasser is below the EPA target limit of 1. The non-cancer hazard indices initially computed for the industrial worker and construction worker are 1 and 9, respectively. For the industrial worker, groundwater intake contributes 72% to the total non-cancer hazard identified. For the construction worker, inhalation of dust in ambient air and groundwater intake contribute 84% and 9%, respectively, to the total non-cancer hazard determined.

Antimony, iron, and manganese are the primary COPCs in groundwater contributing to the elevated non-cancer hazards for the industrial worker and the construction worker. However, the concentrations of metals observed in SEAD-59 groundwater are consistent with the Seneca groundwater background levels. Therefore, the groundwater intake contribution is equivalent to background, and does not result due to the degradation of water quality resulting from activities performed at the site.

Comparably, aluminum and manganese in SEAD-59 soil are the only COPCs contributing to the non-cancer hazard determined for inhalation of dust in ambient air. Again, the aluminum and manganese concentrations in SEAD-59 soil are consistent with, and in fact lower than, comparable levels found in background soils. Therefore, the elevated threat associated with inhalation of dust at SEAD-59 in ambient air is typical of site background

For exposure to SEAD-59 remaining soil from the excavation and SEAD-59 groundwater, the cancer risks for all receptors are below the EPA upper limit of 1×10^{-4} . The total non-cancer hazard index for the adolescent trespasser is below the EPA target limit of 1. The non-cancer hazard indices for the industrial worker and construction worker are 1 and 2, respectively.

For the industrial worker and construction worker, the risks associated with groundwater intake contribute 73% and 56%, respectively to the total non-cancer risks. As previously discussed, the elevated risks associated with groundwater exposure are associated with site background. Therefore, SEAD-59 remaining soil from the excavation is not expected to pose unacceptable threats to potential industrial workers or construction workers. Additional details of the risk assessment are provided in the Supplemental Remedial Investigation Report and in Section 7 of this ROD.

Concentrations of selected chemicals have been identified in the SEAD-59 soil at levels that exceed the NYSDEC's Restricted Industrial Use soil cleanup objectives (SCOs) and in the groundwater at levels that exceed New York's GA groundwater standards, however. As is shown by the results of the human health risk assessment, these chemicals do not pose unacceptable levels of carcinogenic risk or non-carcinogenic hazards for the identified current or future commercial or industrial users of the AOC.

For exposure to SEAD-71 soil and groundwater, the non-cancer hazard indices for the industrial worker, construction worker, and child trespasser are at or above 1. The cancer risk is slightly above the EPA upper limit of 1×10^{-4} for the industrial worker. The risks associated with soil ingestion and soil dermal contact contribute 90% to the total cancer risk for the industrial worker. PAHs in SEAD-71 soil are the primary COPCs contributing to the cancer risks associated with SEAD-71 soil exposure. The highest PAH concentrations were detected in the Fenced Area located between Building 114 and Building 127, where a paved, hard-packed parking area comprised on asphalt and gravel.

To further evaluate risks associated with CERCLA release at SEAD-71, a risk assessment was conducted for exposure to SEAD-71 soil outside the Fenced Area and SEAD-71 groundwater. For exposure to SEAD-71 soil and groundwater outside the Fenced Area, the cancer risks for all receptors are below the EPA upper limit of 1×10^{-4} . The total non-cancer hazard index for the adolescent trespasser is below the EPA target limit of 1. The non-cancer hazard indices for the industrial worker and construction worker are 3 and 10, respectively.

For the industrial worker, the risk associated with groundwater intake contributes 91% to the total non-cancer risk. For the construction worker, the risks associated with inhalation of dust in ambient air, groundwater intake, and dermal contact to groundwater contribute 84%, 25%, and 4%, respectively, to the total non-cancer risk.

Aluminum, antimony, arsenic, chromium, iron, manganese, and thallium are the primary COPCs in groundwater contributing to the elevated non-cancer risks to the industrial worker and the construction worker. However, the concentrations observed in SEAD-71 groundwater for these metals were consistent with the Seneca groundwater background levels. The maximum manganese hit was detected in MW71-2, upgradient of the source area in SEAD-71. MW71-2 was dry most of the time during the groundwater sampling events. Therefore, the manganese concentration detected in MW71-2 might be overstated due to limited water volume and potentially elevated turbidity. In addition, the manganese concentrations detected in a monitoring well downgradient and within the suspected source areas at SEAD-71 (i.e., MW71-4) ranged from non-detect to below the average concentration of the SEDA background data set. In summary, the metal concentrations in SEAD-71 groundwater were consistent with SEDA background.

Aluminum, manganese, and naphthalene in SEAD-71 soil outside the Fenced Area are the only COPCs contributing to the non-cancer risks associated with inhalation of dust in ambient air and contribution from naphthalene is negligible (i.e., < 0.001%). Aluminum and manganese in SEAD-71 soil outside the Fenced Area are consistent with the Seneca background levels. Additional details of the risk assessment are provided in the Supplemental Remedial Investigation Report and in Section 7 of this ROD.

Based on these facts, it is the Army's and the USEPA's determination that the implementation and maintenance of LUCs that prohibit use of the land for residential housing, elementary and secondary schools, childcare facilities, and playgrounds and prohibit the access to and use of groundwater are appropriate means of ensuring that potential risks are managed at both of these AOCs.

The remedies selected for SEAD-59 and SEAD-71 are cost-effective, readily available alternatives that will provide effective and efficient solutions to environmental concerns identified at both AOCs. The selected remedies are discussed in greater detail in **Section 11**.

6.0 SUMMARY OF AOC CHARACTERISTICS

Previous site investigation activities conducted at SEAD-59 and SEAD-71 included the collection of samples from surface soil (top two feet of soil), subsurface soils (below two feet), and groundwater during the RI, and the collection of confirmatory/stockpile soil samples during the TCRA. Associated activities included geophysical investigations, a soil gas survey, and location surveys (including base map preparation). All post-TCRA soil data (i.e., all data collected during the ESIs, Phase I RIs, TCRA, and Phase II RIs that were associated with soils remaining at the AOCs) were evaluated and are presented in this ROD. These data represent the current SEAD-59 SEAD-71 conditions. The results are summarized below.

Groundwater data collected during the 1994 ESIs using bailers are considered non-representative of the current AOC conditions, and have been excluded from this data summary. The 2004 groundwater samples were collected after the TCRA and were deemed representative of the current AOC conditions.

Analytical data collected during the site investigations and construction efforts were historically compared to prevailing State and Federal standards and reference values. State reference values and standards considered included New York's Technical and Guidance Memorandum (TAGM) No. 94-HRW-4046 Soil Cleanup Objectives (SCOs) and Title 6 New York Code of Rules and Regulations (6NYCRR) Subpart 375-6.8 Remedial Program SCOs for soil; and New York's Ambient Water Quality Standards and Guidance Values and Groundwater Effluent Limitations (Technical and Operation Guidance Series [TOG] 1.1.1) for groundwater and surface water. The TAGM soil guidance values were recently replaced by New York's 6NYCRR Subpart 375-6.8 regulations, and data comparisons previously made to the TAGM values have been eliminated from all material presented in this ROD.

Federal reference values considered during the evaluation of analytical data included USEPA Region IX Preliminary Remediation Goals (PRGs) for residential and industrial soils and PRGs for tap water, as well as Maximum Contaminant Limits (MCLs) for Drinking Water.

Results obtained from the analysis of all of the samples and sample duplicates are provided in the appendices of this ROD. Summary tables presenting the comparison of sample data to regulatory reference values merges samples and their associated sample-duplicate results into a single value for each compound that is reflective of the average condition found at a sampling location. The combined analytical results of the ESI, the RI, and completed construction activities are summarized and discussed below.

6.1 SEAD-59: FILL AREA WEST OF BUILDING 135

6.1.1 Soil Gas Survey

A soil gas survey performed at the beginning of the RI at SEAD-59, and the real-time results were used as a preliminary screening tool to identify potential focus points for subsequent RI soil sampling characterization. The survey performed involved the installation, sampling and analysis of soil gas samples from 241 points for total volatile organic compounds (VOCs). The soil gas results are shown in **Figure 6-1**.

The highest soil gas concentrations reported were located within the boundaries of the fill area at SEAD-59. Several smaller areas of elevated soil gas concentrations, at or above 10 parts per million (ppm), were detected at locations to the west and south of the fill area. Based on these data, soil samples were subsequently collected from locations shown to contain elevated VOC content, and these samples were submitted for analysis of Target Analyte and Target Compound List (TAL and TCL, respectively) analytes

Although the soil gas survey results indicated potential VOC contamination at SEAD-59, the soil sample data collected from locations exhibiting high soil gas concentrations (i.e., with total VOC concentrations greater than 10 ppm) did not confirm that VOCs were present in the soil at the AOC.

All soil associated with soil gas results exhibiting concentrations greater than 20 ppm and most soil associated with soil gas results greater than 10 ppm was removed during the TCRA.

6.1.2 Soil Investigation

Due to the excavation of soil and debris during the TCRA at SEAD-59, soil associated with soil samples collected and reported during the Phase I RI has been disturbed, with some of the disturbed soil being staged in windrows within the operable unit, while other portions of the disturbed soil has been removed from the AOC and transported off-site for disposal at licensed landfills. The following discussion provides a summary evaluation of the quality of the soil that remains at the AOC. The Army's analysis indicates that data from 185 surface soil (0-2 feet [ft] below grade or ground surface [bgs]) samples are representative of the current SEAD-59 surface soil conditions. Similarly, data for 14 subsurface soil (2-15 ft bgs.) samples continue to be representative of SEAD-59 subsurface soil conditions, while results from 54 samples collected from residual piles of excavated soil continue to be representative of soil that is stage in SEAD-59.

During its assessment and evaluation of contaminants within soil at SEAD-59 and SEAD-71, the Army compared the pertinent soil data to SCOs for Unrestricted, Commercial, and Industrial Use presented under the New York Code of Rules and Regulations (6NYCRR) Subpart 375-6.8 and USEPA Region IX PRGs)for industrial soils. The 95% upper confidence limit concentrations of the arithmetic means³ recommended by the EPA ProUCL program (hereafter referred to as UCLs) for compounds with individual sample exceedances of the NYSDEC SCOs or the Region IX PRGs found in the SEAD-59 and SEAD-71 soils are also summarized in referenced tables.

The discussion of SEAD-59 soil is presented separately for in-situ (in place in the ground) soil and stockpiles soils.

³ Confidence limits for the mean ([Snedecor and Cochran, 1989](#)) are an interval estimate for the mean. Interval estimates are often desirable because the estimate of the mean varies from sample to sample. Instead of a single estimate for the mean, a confidence interval generates a lower and upper limit for the mean. The interval estimate gives an indication of how much uncertainty there is in our estimate of the true mean. The narrower the interval, the more precise is our estimate. The 95th upper confidence limit is the highest estimate for the mean that is expected to exist with 95 percent confidence for a particular set of data.

SEAD-59 In-Situ Soils (Total, surface and subsurface)

Summary results of chemical analyses performed on in-situ soils in SEAD-59 total soil, surface soil only, and subsurface soil only are presented in **Tables 6-1a** through **6-1c**, **6-2a** through **6-2c**, **6-3a** through **6-3c**, and **6-4a** through **6-4c**. **Table series 6-1** provides summary results and data comparisons to New York's Unrestricted Use SCOs; **Table series 6-2** provides comparable data presentations versus New York's Restricted Commercial Use SCOs; **Table series 6-3** provides comparable data presentations versus New York's Restricted Industrial Use SCOs; while **Table series 6-4** provides comparable data presentations versus USEPA Region IX's PRGs for Industrial soil guidance values. Summary information provided in each of these tables includes the number of samples collected by soil horizon (i.e., total soil, surface soil, subsurface soil); the number of times and the frequency with which a compound was detected in that soil horizon; the number of times a detected compound was found at a concentration that surpassed the comparative guidance levels evaluated; the maximum concentration of the compound that was detected in the soil horizon; and, for those compounds found at a concentration above a comparative guidance value, the 95th UCL of the dataset's mean for the compound and an indication if this value surpassed the comparative guidance value evaluated. The complete copy of the analytical data for the surface and subsurface soil evaluated during the investigation of SEAD-59 are provided in **Appendix Table D-1** (surface soil) and **Appendix Table D-2** (subsurface soil).

Volatile Organic Compounds (VOCs)

Acetone (12 times) and methyl ethyl ketone (1 time) were the only VOCs found in SEAD-59 at concentrations above their respective Unrestricted Use SCO levels, while acetone was the only VOC observed to exceed any of the other comparative guidance values considered (i.e., Restricted Commercial).

Acetone was also the VOC found at the highest overall concentration in soil samples characterized, present at a level of 500 µg/Kg in the surface soil samples.

Semivolatile Organic Compounds (SVOCs)

The seven cPAH compounds were the only SVOCs observed to exceed New York's Unrestricted Use SCO levels and this occurred in 37 or more of the 199 total samples characterized. Concentrations of indeno(1,2,3-cd)pyrene (51 times) and chrysene (50 times) were most frequently observed to exceed their respective Unrestricted Use SCOs, and the majority of these were found in surface soil samples. Further, the majority of all soil concentrations measured for cPAH compounds that were above their Unrestricted Use SCO levels were found in surface soils collected at SEAD-59. Only six of the cPAH compounds (i.e., exclusive of dibenz(a,h)anthracene) were found in subsurface soil samples collected from SEAD-59 at levels that exceeded their Unrestricted Use SCO levels, and this only occurred in one or two individual samples for each compound. Four [i.e., benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene] of the cPAH compounds were detected in in-situ soil samples collected from SEAD-59 that exceeded their Restricted Commercial Use SCO levels. Again, samples found to contain elevated levels of these cPAHs were primarily located in the surface soil samples and only benzo(a)pyrene was found in subsurface soils (2 times) at levels above New York's Restricted

Commercial level. Similarly, two cPAH compounds ([benzo(a)pyrene (47 times) and dibenz(a,h)anthracene (2 times)] were found in SEAD-59 in-situ soil samples at levels above New York's Restricted Industrial Use levels. The majority of these occurrences were limited to surface soil samples, as only one subsurface soil contained an elevated concentration of benzo(a)pyrene. Comparable trends are seen for the comparison of the cPAHs levels measured in SEAD-59 in-situ soils versus the USEPA's Region IX PRGs for Industrial soil.

Pesticides and Polychlorinated Biphenyls (PCBs)

Four pesticides (i.e., 4,4'-DDD, 4,4'-DDE, 4,4'-DDT and endrin) were detected in soil samples at concentrations in excess of one of the federal or state comparative levels. The pesticide 4,4'-DDT was the compound found in samples at the highest individual sample concentration; the pesticide 4,4'-DDE was found in the greatest number of samples at concentrations above New York's Unrestricted Use SCO levels. Similarly, the other two identified pesticides were found frequently at concentrations above New York's Unrestricted Use SCOs. The 95th UCL values computed for all three of the 4,4' pesticide species also exceeded the New York Unrestricted Use SCOs. Only one other pesticide, endrin, was found in any SEAD-59 in-situ soil sample at a level that exceeded its Unrestricted Use SCO level. Again the majority of the samples found to contain elevated levels of pesticides were located in the surface soils.

None of the pesticide or PCB compounds found in the SEAD-59 in-situ soil samples contained any levels of contaminant that exceeded either the New York Restricted Commercial or Industrial Use levels or the USEPA Region IX PRG for Industrial SCOs.

Metals

Nine metals (i.e., arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver and zinc) were found in one or more of the soils at levels that exceeded New York's Unrestricted Use SCO levels, and of these nickel was found most frequently at levels above its SCO value (37 times.). Four other metals (lead, 14 times; mercury, 15 times; silver, 19 times; and zinc, 19 times) were also found in soil samples above their respective Unrestricted Use SCO levels. Lead was the only other metal that was found at elevated levels in more than 10 of the soil samples characterized. None of the metals were seen at 95th UCL concentrations that exceeded their respective Unrestricted Use SCO levels.

Arsenic and copper were the only metals that were observed to exceed New York's Commercial Use SCO level, and this occurred in two and one sample respectively. In all cases these elevated levels were limited to the surface soil samples. Similarly only arsenic was observed in any individual sample at concentrations that exceeded New York's Industrial Use SCOs; this occurred twice in two surface soil samples. Arsenic was found at concentrations above the USEPA's Region IX PRG value for Industrial soil in every soil sample characterized, and the calculated 95th UCL value was also above this guidance value. Antimony was also found in one surface soil sample at a level that exceeded its USEPA Region IX PRG for Industrial soil. .

Stockpiled Soil in SEAD-59

Summary results of chemical analyses performed on stockpiled soils in SEAD-59 are presented in **Tables 6-5 through 6-8**. **Table 6-5** provides summary results and data comparisons to New York's Unrestricted Use SCOs; **Table 6-6** provides comparable data presentations versus New York's Restricted Commercial Use SCOs; **Table 6-7** provides comparable data presentations versus New York's Restricted Industrial Use SCOs; while **Table 6-8** provides comparable data presentations versus USEPA Region IX's PRGs for Industrial soil guidance values. Summary information provided in each of these tables includes the number of samples collected; the number of times and the frequency with which a compound was detected in the stockpiled soil; the number of times a detected compound was found at a concentration that surpassed the comparative guidance levels evaluated; the maximum concentration of the compound that was detected in the stockpiled soil; and, for those compounds found at a concentration above a comparative guidance value, the 95th upper confidence limit (95th UCL) of the dataset's mean for the compound and an indication if this value surpassed the comparative guidance value evaluated. The complete copy of the analytical data for the stockpiled soil evaluated during the investigation of SEAD-59 is provided in **Appendix Table D-3**.

VOCs

Acetone was the only VOC that was observed to exceed any of the comparative guidance values, surpassing New York's Unrestricted Use level in a single sample.

SVOCs

All seven of the cPAH compounds were observed to exceed New York's Unrestricted Use SCO levels in 45 or more of the samples characterized, with concentrations of indeno(1,2,3-cd)pyrene surpassing its Unrestricted Use level most frequently. The 95th UCL computed for all of these cPAHs were also above New York's Unrestricted Use SCO levels.

Five cPAHs [i.e., benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene] were detected in one or more of the samples at concentrations above New York's Commercial Use SCO levels, while three cPAHs [i.e., benzo(a)anthracene, benzo(a)pyrene, and dibenz(a,h)anthracene] were observed to exceed New York Industrial Use SCOs in one or more samples. Five cPAHs [i.e., benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene] were detected in one or more of the samples characterized at levels that exceeded USEPA's Industrial soil PRG values.

Pesticides and PCBs

Three pesticides, 4,4'-DDD, 4,4'-DDE, and 4,4'-DDT were detected in individual samples of stockpiled soil at levels above one or more of their respective New York Unrestricted Use SCO levels. The 95th UCL values computed for all three of the 4,4' pesticide species also exceeded the New York Unrestricted Use cleanup levels. None of the pesticides detected in the stockpiled soils at SEAD-59 were detected at concentrations in individual samples or with 95th UCL values that surpassed New York's Commercial or Industrial Use or USEPA's Region IX Industrial Soil PRG levels.

Metals

Seven metals (i.e., chromium, copper, lead, mercury, nickel, silver and zinc) were found in one or more of the stockpiled soil samples at levels that exceeded New York's Unrestricted Use SCO levels, and of these nickel was found most frequently at levels above its cleanup value (20 times.). Lead was the only other metal that was found at elevated levels in more than 10 of the soil samples characterized. Similarly, lead and nickel were the only metal species seen at 95th UCL concentrations that exceeded their respective Unrestricted Use SCO levels.

Lead was observed to exceed New York's Commercial Use SCO level, and this occurred in only one sample. None of the detected metals were observed in individual samples at concentrations that exceeded New York's Industrial Use SCOs, and none of the metals were observed at 95th UCL concentrations that were above either New York's Commercial or Industrial Use SCO levels. Arsenic was found at concentrations above the USEPA's Region IX PRG value for Industrial soil in every sample, and the calculated 95th UCL value was also above this guidance value. Lead was found in a single sample at a concentration above its USEPA Region IX PRG for Industrial soil.

6.1.3 Groundwater Investigation

SEAD-59 groundwater samples were collected from seven monitoring wells during the two 2004 sampling events. The maximum concentrations were compared to federal and state criteria including New York State Class GA Groundwater Standards, the federal MCLs and the USEPA's Region IX PRGs for Tap Water. The SEAD-59 groundwater sample summary results are presented in **Table 6-9**. The complete groundwater data evaluated for SEAD-59 is provided in **Appendix Table D-4**.

Organic compounds (i.e., VOCs, SVOCs, or pesticide/PCBs) were not detected in groundwater samples at any level in excess of state or federal comparative values.

Metals

Antimony, iron, manganese, and sodium concentrations were each detected above their respective NYSDEC GA Standards in one or more of the SEAD-59 groundwater samples characterized. Antimony was the only metal found at concentrations that exceeded another of its comparative guidance values, as it exceeded its MCL value in three samples.

6.2 SEAD-71: THE ALLEGED PAINT DISPOSAL AREA

6.2.1 Soil Investigation

The investigation of soil within SEAD-71 included the analysis of 77 total samples, including 69 surface soil (0-2 ft bgs.) and eight subsurface soil samples (2-15 ft bgs.). Of the total number of soil samples collected and characterized, 58 were collected at locations exterior to the Fenced Area, including 54 surface samples and four subsurface samples.

Summary results of chemical analyses performed on all SEAD-71 soil samples (total soil, surface soil only, and subsurface summarized separately in a, b, and c) are presented in **Tables 6-10a** through **6-10c**, **6-11a** through **6-11c**, **6-12a** through **6-12c**, and **6-13a** through **6-13c**. **Table series 6-10** provides summary results and data comparisons to New York's Unrestricted Use SCOs; **Table series 6-11**

provides comparable data presentations versus New York's Restricted Commercial Use SCOs; **Table series 6-12** provides comparable data presentations versus New York's Restricted Industrial Use SCOs; while **Table series 6-13** provides comparable data presentations versus USEPA Region IX's PRGs for Industrial soil guidance values. Summary results of chemical analyses performed on the soil collected outside the Fenced Area of SEAD-71 (total soil, surface soil only, and subsurface summarized separately in a, b, and c) are presented in **Tables 6-14a** through **6-14c**, **6-15a** through **6-15c**, **6-16a** through **6-16c**, and **6-17a** through **6-17c**. **Table series 6-14** provides summary results and data comparisons to New York's Unrestricted Use SCOs; **Table series 6-15** provides comparable data presentations versus New York's Restricted Commercial Use SCOs; **Table series 6-16** provides comparable data presentations versus New York's Restricted Industrial Use SCOs; while **Table series 6-17** provides comparable data presentations versus USEPA Region IX's PRGs for Industrial soil guidance values.

Summary information provided in each of these tables includes the number of samples collected by soil horizon (i.e., total soil, surface soil, subsurface soil); the number of times and the frequency with which a compound was detected in that soil horizon; the number of times a detected compound was found at a concentration that surpassed the comparative guidance levels evaluated; the maximum concentration of the compound that was detected in the soil horizon; and, for those compounds found at a concentration above a comparative guidance value, the 95th upper confidence limit (95th UCL) of the dataset's mean for the compound and an indication if this value surpassed the comparative guidance value evaluated. The complete copy of the analytical data for the all SEAD-71 surface and subsurface soil evaluated during the investigation are provided in **Appendix Table D-5** (surface soil) and **Appendix Table D-6** (subsurface soil). The complete copy of the analytical data for soil samples collected outside the Fenced Area in SEAD-71 evaluated during the investigation are provided in **Appendix Table D-7** (surface soil) and **Appendix Table D-8** (subsurface soil).

VOCs

Acetone was the only VOC observed in any sample collected in SEAD-71 observed to exceed any of the comparative guidance values considered, and it was found in two surface soil samples collected exterior to the Fenced Area at concentrations that exceeded New York's Unrestricted Use SCOs.

SVOCs

PAH and cPAH compounds were generally the most frequently detected SVOCs observed in the SEAD-71 soils, and were also those that were detected at the highest concentrations. The cPAH compounds were the species that also had exhibited sample concentrations above New York's SCOs and the Region IX PRGs for Industrial soil. The maximum concentrations of cPAHs detected throughout SEAD-71 were typically found in surface soils, with the overall highest cPAHs found within the surface soils that were collected within the Fenced Area. Generally, the cPAH concentrations reported for samples within the Fenced Area were an order of magnitude higher than those found exterior of this segment of SEAD-71. cPAHs were found at concentrations above their respective New York SCO levels in both surface and subsurface soil samples within the Fenced Area, but they were not found above their respective New York Restricted Commercial or Industrial Use SCOs in the subsurface soils located exterior to the Fenced

Area.. Concentrations of selected cPAH compounds in samples collected inside in exterior of the Fenced Area also exceeded their USEPA Region IX Industrial PRGs.

The Fenced Area is paved in some locations and covered with crushed stone in other locations. Elevated PAH concentrations detected in surface soil within the Fenced Area result from the asphalt and hard fill that was used to construct the area. At the time of construction, the Army typically utilized hard fill consisting of oiled crushed stone to form a sturdy base for areas subjected to heavy vehicular traffic and storage operations. The oil was used to help in the compaction of the crushed stone and aided in dust suppression. The presence of asphalt is noted in the boring log of MW71-1 and field notes recorded while surface soil samples were collected within the Fenced Area. The crushed asphalt materials in the hard fill and the oil used in the construction of the storage area were likely the cause of the consistently elevated PAH concentrations throughout the Fenced Area.

Pesticides and PCBs

Concentrations measured for Aroclor-1260 in two samples exceeded its New York Unrestricted Use SCO level in the Fenced Area.

Three pesticides or one PCB compounds (i.e., 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, and Aroclor-1260) were found at concentrations above New York's Unrestricted Use SCO guidance values in samples that were collected exterior to the Fenced Area, while these four plus endrin were found at concentrations above their Unrestricted Use SCO values in soil samples collected from inside the Fenced Area. 4,4'-DDD was the only pesticide or PCB compound that was observed at concentrations that exceeded any of the other comparative guidance values, and this was found in surface soil samples only collected within the Fenced Area at concentrations that exceeded New York's Restricted Commercial Use SCOs.

Metals

Seven metals (i.e., arsenic, chromium, copper, lead, mercury, nickel and zinc) were observed to exceed their respective Unrestricted Use SCOs in soil samples collected exterior of the Fenced Area, while six of these seven metals (i.e., exclusive of arsenic) plus cadmium and silver were observed to exceed their respective Unrestricted Use levels in soil samples collected in the Fenced Area. The metals most frequently detected at concentrations above Unrestricted Use levels were lead, zinc and nickel. Lead and cadmium were the only metals observed at concentrations in excess of New York's Restricted Commercial Use levels in samples collected from the Fence Area, while only lead was detected at a concentration above New York's Restricted Commercial value in soil samples outside of the Fenced Area. All metals detected in soil samples were detected at concentrations below their respective New York Restricted Industrial Use levels. Arsenic and lead were the only metals observed to exceed USEPA's Region IX PRGs for Industrial soil, in samples collected inside and outside of the Fenced Area in SEAD-71.

6.2.2 Groundwater Investigation

SEAD-71 groundwater samples were collected from four monitoring wells during the two 2004 sampling events. The maximum concentrations detected in SEAD-71 groundwater and the comparison with the

guidance values are presented in **Table 6-18**. The complete groundwater data evaluated for SEAD-71 is provided in **Appendix Table D-9**.

VOCs

No VOC was detected in any SEAD-71 groundwater sample at a level above any of its comparative values.

SVOCs

The concentration reported for 4-nitroaniline in one sample of SEAD-71 groundwater exceeded its New York GA standard, and its Region IX PRG for Tap Water.

Pesticides and PCBs

No pesticide or PCB was detected in any SEAD-71 groundwater sample at a level above any of its comparative values.

Metals

Antimony, iron, manganese, and sodium concentrations were detected in SEAD-71 groundwater above their respective NYSDEC GA standards, and of these metals sodium exceeded its GA standard most frequently (4 times). Antimony was observed at concentrations above its GA standard value and its federal MCL in three samples, while manganese was the only metal observed at a concentration in excess of its Region IX PRG value for Tap Water.

7.0 SUMMARY OF HUMAN HEALTH AND ECOLOGICAL RISKS

Human health and ecological risk assessments were performed for SEAD-59 and SEAD-71 using the analytical data developed during site investigations as discussed above. Full details of the human health and ecological risk assessments for SEAD-59 and SEAD-71 are presented in the Phase II RI report, which is available in the Administrative Record file. A summary of pertinent information is provided below.

7.1 HUMAN HEALTH RISK ASSESSMENT

A Superfund baseline human health risk assessment is an analysis of the potential adverse health effects caused by hazardous substance exposure at a site in the absence of any actions to control or mitigate them under current- and future-land uses. The baseline human health risk assessments performed for SEAD-59 and SEAD-71 were conducted in accordance with the USEPA's *Risk Assessment Guidance for Superfund (RAGS)* (USEPA, 1989) and the supplemental guidance and updates to the RAGS. Technical judgment, consultation with USEPA staff, and review of recent publications were used in the development of the risk assessment. The results of the risk assessment were used to identify whether a corrective action may be warranted at one, or both, of the AOCs.

The reasonable maximum exposure (RME) scenario was evaluated during the human health risk assessment. The human health risk assessment methodology is shown in **Figure 7-1**. A four-step process was used for assessing site-related human health risks for RME exposure scenarios:

- Hazard Identification – identified the contaminants of concern based on several factors such as toxicity, frequency of occurrence, and concentration;
- Exposure Assessment – estimated the magnitude of actual and/or potential human exposures, the frequency and duration of these exposures, and the pathways by which humans are potentially exposed;
- Toxicity Assessment – determined the types of adverse health effects associated with chemical exposures, and the relationship between magnitude of exposure (dose) and severity of adverse effects (response); and
- Risk Characterization – summarized and combined the outputs of the exposure and toxicity assessments to provide a quantitative assessment of site-related risks (for example, one-in-a-million excess cancer risk).

7.1.1 Hazard Identification

The contaminant sources at SEAD-59 were the construction debris and drums comprising the fill area and the debris and paint cans found elsewhere within the AOC. Additionally, spills or leaks from vehicles and other “building and grounds” type materials previously staged here could represent potential sources of contaminants that have been identified. The primary release mechanisms from the sources included soil particles resuspension and deposition, surface water runoff, and the infiltration of precipitation through the source areas. Potentially affected media at SEAD-59 were soil (including stockpile soils produced

during the 2002 TCRA) and groundwater. The source areas were excavated and removed during the 2002 TCRA by ENSR (2002).

The contaminant sources at SEAD-71 were waste materials, including debris such as sheet metal, asphalt, chain link fencing, sand and stone, piping, railroad ties, and wood and cinders, that were identified during test pit operations. In addition, unsubstantiated rumors suggested that paint and oil may have also been disposed at the site. The primary release mechanisms from the sources are soil particles resuspension and deposition, surface water runoff, which makes its way onto the areas to the southwest, and infiltration of precipitation through the suspected source areas. Potentially affected media at the site include soil and groundwater. Again, the former source areas were excavated and removed during the 2002 TCRA by ENSR (2002).

Contaminants of Concern

Volatile Organic Compounds (VOCs)

Volatile organic compounds were detected infrequently in soil and groundwater at SEAD-59 and SEAD-71 and the concentrations found were generally below the identified applicable or relevant and appropriate requirement (ARAR) and “to be considered” (TBC) guidance values (i.e., the NYSDEC Part 375 cleanup objective values for soil; and the NYSDEC GA Standards and Guidance, the Drinking Water MCLs for groundwater). Because of the low prevalence and low concentrations, the sites are not significantly impacted by VOCs and volatilization of VOCs was not considered significant in this assessment.

Semivolatile Organic Compounds (SVOCs)

The principal semi-volatile compounds found in SEAD-59 and SEAD-71 soil were PAHs including the seven cPAHs. Generally, these constituents are relatively persistent and immobile in the environment. Transport of PAHs is limited due to their low water solubility and strong soil affinity. TCLP analysis was conducted for SVOCs on several samples collected during the TCRA and the results indicated that none of the SVOCs were detected in the leachate. Therefore, leaching of SVOCs to groundwater is not expected to be a significant transport mechanism at the AOCs. Only a few SVOCs (4-nitroaniline, di-n-butylphthalate, and bis(2-ethylhexyl)phthalate) were detected in the groundwater, and these were all found infrequently. Groundwater at the AOCs is not expected to be significantly impacted by SVOCs.

Pesticides/Polychlorinated Biphenyls (PCBs)

Pesticides and one PCB, Aroclor-1260, were found in soil at both AOCs. Pesticides are immobile in soil as their affinity for absorption into the soil reduces their transport potential. Low concentrations of pesticides can dissolve into water but absorption to soil is the dominant partitioning route. Transport of suspended solids and sediment in groundwater is a potential transportation mechanism; however, groundwater flow through beneath the AOCs is low based on field notes from 2004 sampling events, thus reducing the rate of groundwater transport. Three pesticides were detected but no PCBs were detected in groundwater in the 2004 sampling events.

Metals

Multiple metals were found in groundwater and soil at SEAD-59 and SEAD-71. The behavior of metals in soil is unlike organic compounds in many aspects. For example, generally volatilization from soil is not considered a significant mechanism for metal migration and was not evaluated in this risk assessment. However, leaching and sorption of metals are considered potential mechanisms for transport. Leaching of metals from soil is controlled by numerous factors, the most important being its chemical form (base metal or cation) in the soil. The leaching of metals from soils is substantial if the metal exists as a soluble salt. Upon contact with surface water or precipitation, the metals, either as metal oxides or metal salts, can be solubilized, eventually leaching to the groundwater. TCLP analyses were performed for some samples collected during the TCRA. Based on the results obtained, leaching is not expected to be a significant transport mechanism at SEAD-59 and SEAD-71. Soil samples from both sites had exceedances of NYSDEC SCO values for many metals. Groundwater samples from both sites had exceedances of the identified ARARs or TBCs for the following metals: aluminum, antimony, iron, manganese, and sodium.

7.1.2 Exposure Assessment

As part of the Exposure Assessment component of the risk assessment, conceptual site models (CSMs) were developed for both AOCs which considered the contaminants of concern (COCs) identified at the AOCs, the media affected, the most probable future receptors, and the duration each receptor would be exposed to hazardous substances identified in the area.

Conceptual Site Model

Potential sources of contamination, exposure pathways, and receptors for SEAD-59 and SEAD-71 are depicted graphically in the CSM shown in **Figure 7-2**. The CSM provides an overall assessment of the primary and secondary sources of contamination found at the AOC, and the corresponding release mechanisms and the affected media. The CSM also identifies the potential human receptors and the associated pathways of exposure to the affected media.

Human Receptors and Exposure Pathways

The baseline risk assessment evaluated the potential health effects that may result from hazardous substance exposure for the following three receptor groups:

- Current/Future Construction Worker;
- Current/Future Industrial Worker; and,
- Current/Future Adolescent Trespasser/Visitor.

The following exposure pathways were considered:

1. Inhalation of dust from soil in ambient air (construction worker, adolescent trespasser / visitor, industrial worker);
2. Ingestion of soil (construction worker, adolescent trespasser / visitor, industrial worker);
3. Dermal contact to soil (construction worker, adolescent trespasser / visitor, industrial worker);

4. Ingestion of subsurface soils (construction worker);
5. Dermal contact to subsurface soils (construction worker);
6. Ingestion of groundwater (daily) (construction worker, adolescent trespasser / visitor, industrial worker);
7. Dermal contact to groundwater (construction worker);
8. Dermal contact to surface water (construction worker, adolescent trespasser / visitor).

7.1.3 Carcinogenic and Non-Carcinogenic Effects

Under current USEPA guidelines, the likelihood of carcinogenic and non-carcinogenic effects due to exposure to site-related chemicals is considered separately. Non-carcinogenic hazards were assessed by the calculation of a Hazard Index (HI), which is an expression of the chronic daily intake of a chemical divided by its safe or Reference Dose (RfD). An HI that exceeds 1.0 indicates a potential for non-carcinogenic effects to occur. Carcinogenic risks were evaluated using a cancer Slope Factor (SF), which is a measure of the cancer-causing potential of a chemical. Slope Factors are multiplied by daily intake estimates to generate an upper-bound estimate of excess lifetime cancer risk. For known or suspected carcinogens, USEPA has defined an acceptable cancer risk range of 10^{-4} to 10^{-6} (one-in-ten thousand to one-in-one million) or less.

7.1.4 Evaluation of Lead Exposure

Lead was identified as a COC in soil and groundwater at SEAD-71, and in stockpiled soil at SEAD-59. Risk associated with the identified lead were evaluated using the *Recommendations of the Technical Review Workgroup for Lead for an Interim Approach to Assessing Risks Associated with Adult Exposures to Lead in Soil* (USEPA, 2003b). At SEAD-71, the evaluation of lead exposure was considered for the industrial worker and the construction worker, and for a child resident. The central tendency (CT) exposure factors for industrial workers and construction workers were used to evaluate potential risks associated with lead in soil. The industrial worker was assumed to accidentally intake 50 mg of soil each day while working at the SWMU for 219 days each year. This assumption is consistent with the default assumptions used in the adult lead model (USEPA, 2003b). There is no lead pathway for lead in groundwater for the adult receptor.

This model provides an assessment of non-residential exposure by relating soil lead intake to blood lead concentrations in women of childbearing age. The methodology focuses on estimating fetal blood lead levels in women exposed to site soils. It should be noted that the adult lead model is based on the assumption of continuing long-term exposure. As construction workers are expected to work at the site for only a short-term (i.e., approximately 1 year), risk associated with lead exposure is expected to be minor and therefore it was not evaluated in the risk assessment.

Risks associated with lead exposure in soil and groundwater were evaluated for a child resident using the Integrated Exposure Uptake Biokinetic Model for Lead in Children (IEUBK) developed by USEPA at SEAD-71 and at SEAD-59. The IEUBK model results, based on residential exposure assumptions, can only be used as a screening tool as the exposure frequency for the adolescent trespasser is much less than the residential child. In addition, a child receptor is considered more sensitive than an adolescent receptor. The IEUBK windows version software package was developed based on the *IEUBK Guidance Manual* (USEPA

1994). The model utilizes four interrelated modules (exposure, uptake, biokinetic, and probability distribution) to estimate blood lead (PbB) levels in children exposed to lead-contaminated media.

For the industrial worker and the adolescent trespasser, the AOC-specific exposure point concentrations (EPCs) and CT exposure factors were used along with the default assumptions presented in the models to derive the lead level estimation for the receptors. Risk characterization for lead exposure was conducted based on a comparison between the estimated blood lead level and the target PbB level of concern. Blood lead level was estimated based on the USEPA IEUBK model or the Adult Lead Model. The target PbB level of concern is 10.0 micrograms per deciliter ($\mu\text{g}/\text{dL}$) for a child (USEPA, 1994, 2003b).

7.1.5 Summary of Human Health Risks

The human health (Chapter 6) and screening level ecological risk assessments (chapter 7) for SEAD-59 and SEAD-71 are fully described and discussed in the Phase II Remedial Investigation Report for the AOCs (Parsons, 2006). The human health risk assessment included a quantitative uncertainty section analysis, and results derived and discussed in the uncertainty analysis are accepted as the final basis of pending future actions for the AOCs. Summary results of the human health risk assessments completed for exposure to contaminants identified in SEAD-59 in-situ soils (i.e., soils left in the ground) and groundwater; SEAD-59 stockpiled soil and groundwater; and, SEAD-71 soils and groundwater are provided in **Tables 7-1, 7-4, 7-6, and 7-7**, respectively. Data supporting the summary human health risk assessment results are provide in **Appendix E Tables 1 through 9C**. Results of the lead risk characterization for SEAD-59 stockpiled soil are presented in **Appendix E Tables 10, 11, and 12** and SEAD-71 soil and groundwater are presented in **Appendix E Tables 13, 14, and 15**.

SEAD-59 In-Situ Soil and Groundwater Exposure

Carcinogenic Risks and Non Carcinogenic Hazards

Table 7-1 summarizes the potential cancer risks and non-cancer hazards that may result due to future human receptors exposure to SEAD-59 in-situ (i.e., in ground) soil and groundwater. The results of the RME scenario are presented for an industrial worker, a construction worker, and an adolescent trespasser. The RME cancer risks for all receptors are below the USEPA upper limit of 1×10^{-4} ; cancer risks for the industrial worker, construction worker, and child trespasser are 2×10^{-5} , 2×10^{-6} , and 5×10^{-7} , respectively.

The total non-cancer hazard index for the adolescent trespasser is below the EPA target limit of 1. The non-cancer hazard indices determined for the industrial worker and construction worker are $1\text{E}+00$ (HI=1.2) and $9\text{E}+00$ (HI=8.9), respectively. For the industrial worker, the hazard index associated with SEAD-59 groundwater intake contributes 72% (HI = 0.8) to the total non-cancer hazard index reported. For the construction worker, inhalation of dust in ambient air and groundwater intake contribute 84% (HI = 7.5) and 9% (HI = 0.8), respectively, to the total non-cancer hazard index reported.

Antimony, iron, and manganese are the primary COPCs in SEAD-59 groundwater that contribute to the elevated non-cancer hazard index determined for the industrial worker and the construction worker. In each case, the maximum COPC concentration measured at SEAD-59 was used as the EPC in the risk assessment. **Table 7-2** summarizes the maximum and average metal COPC concentrations found in

SEAD-59 groundwater compared to SEDA background groundwater levels. Review of these data indicate that the maximum antimony, iron, and manganese concentrations recorded in SEAD-59 groundwater are lower than comparable maximums reported in the background groundwater monitoring wells at the Depot. Similarly, the average groundwater concentration recorded for the three COPC metals at SEAD-59 are also lower than comparable COPC averages found in the Depot's background groundwater set. Furthermore, the maximum concentrations reported for each of the SEAD-59 COPC metals was found in one of the two wells (i.e., MW59-3 and MW59-6) that are hydraulically upgradient of SEAD-59; the concentrations of the three COPC metals decrease as the groundwater flows through SEAD-59. Therefore, the elevated risks associated with exposure to metals in SEAD-59 groundwater result due to metals that are associated with the native soils and waters in the geologic formation at the Depot and are not associated with a release from the AOC.

With further reference to the construction worker's non-cancer hazard index (i.e., 9E+00), aluminum and manganese in SEAD-59 soil are the only COPCs that contribute to the non-cancer hazard levels that are associated with the inhalation of dust (HI = 7.5). Exposure to manganese inhaled as dusts represents nearly 81% of the overall hazard index. As is shown in **Table 7-3**, aluminum and manganese concentrations remaining in SEAD-59 soil are lower than Seneca background soils levels, and are less than federal and state guidance values that are defined as acceptable for more restricted types of future use (e.g., unrestricted use and residential). The future use of SEAD-59 is commercial or industrial.

In addition to the descriptive statistics comparison, both non-parametric (Mann-Whitney T test) and parametric (Student's T test) statistical test methods were used to determine if the SEAD-59 soil concentrations represented a statistically different population than those found in the SEDA background data set. The statistical test results are presented in **Appendix H** of the Phase II RI Report and are summarized in Section 6.8.5.2 of the Phase II RI Report. Both tests conclude that the aluminum and manganese concentrations observed in SEAD-59 soil are not statistically above the Seneca background levels.

As is indicated above, the largest component of the construction worker's overall non-cancer HI results from inhalation of dust that contains manganese. This HI is based on a reference concentration for chronic inhalation exposure (RfC) derived in a study that deals with the inhalation of manganese dioxide dust, and to which the EPA assigns an uncertainty factor of 1000, which indicates the EPA's low degree of confidence in its value. The exact composition of the manganese identified in the soil samples collected from SEAD-59 is unknown, but it is highly unlikely that all of the manganese in the soil exists as manganese dioxide. Manganese can exist in numerous forms, including various oxides, salts, carbonates, and silicates, and thus it is unlikely that it is only present as manganese dioxide in the soil at SEAD-59. Therefore, the use of an RfC that is derived solely from a study of industrial worker's exposure to manganese dioxide at a battery manufacturing facility is not fully accurate, and is likely to over-estimate impacts to outside workers at a location where other forms of manganese are likely to be present. However, since the exact composition of the manganese in the soil is unknown, no quantitative adjustments to the HI can be made. Further, it is important to note that the inhalation reference dose used as the basis of the inhalation portion of the risk assessment is 4000 times lower than the American

Conference of Governmental and Industrial Hygienists' threshold limit value⁴ (TLV) for manganese exposure in industrial situations, further emphasizing the very conservative nature of the RfC used in the calculation of risk at this site.

Therefore, the elevated risks associated with potential inhalation of ambient air containing dusts from SEAD-59 soil are believed to be overestimated and likely attributable to background soil concentrations that are not associated with a release at the AOC.

SEAD-59 Groundwater and Stockpiled Soil

Carcinogenic Risks and Non Carcinogenic Hazards

Table 7-4 summarizes the potential cancer risks and non-cancer hazard levels that may be encountered by future human receptors due to exposure to soil that remains in stockpiles and groundwater in SEAD-59. The risks/hazards anticipated due to exposure to SEAD-59 groundwater under this analysis are equivalent to those previously estimated under the SEAD-59 in-place (i.e., in the ground) and groundwater scenario discussed above.

The RME cancer risks for all receptors to SEAD-59 stockpiled soil and groundwater are below the USEPA upper limit of 1×10^{-4} . The cancer risks for the industrial worker, construction worker, and child trespasser are 6×10^{-5} , 6×10^{-6} , and 1×10^{-6} , respectively. The total non-cancer hazard index for the adolescent trespasser is below the EPA target limit of 1. The non-cancer hazard indices for the industrial worker and construction worker are 1E+00 (HI = 1.2) and 2E+00 (HI = 1.5), respectively.

For the industrial worker and construction worker, the risks associated with groundwater intake contribute 73% (HI = 0.8) and 56% (HI = 0.8), respectively to the total non-cancer hazard levels identified. As previously discussed above, the elevated hazards associated with groundwater exposure result from background levels of antimony, iron and manganese that are present in the groundwater at SEAD-59, and which are not associated with releases that have occurred at the AOC. Absent the hazard index contribution from SEAD-59 groundwater, the HI levels computed for the industrial worker and the construction worker both fall to less than 1.

Metals in soil also contribute to the industrial worker's and construction worker's hazard indices under the stockpiled soil/groundwater exposure scenario. Ingestion of soils containing metals is the primary soil exposure route that contributes to the potential effects, followed by inhalation of dusts. Seven metals (aluminum, antimony, arsenic, iron, manganese, thallium and vanadium) show indication of effects via ingestion, while only two, aluminum and manganese, show potential effects via inhalation. **Table 7-5** summarizes the levels of the seven metals in the stockpiled soils that contribute to the industrial worker's and construction worker's elevated non-cancer hazard indices, and compare these values to SEDA background soil concentrations and varying regulatory soil comparative levels.

The comparison of SEAD-59 stockpiled soil versus SEDA background soil metal concentrations indicates that the metals that remain in the stockpiled soils at SEAD-59 are generally consistent with, and typically lower than, the levels of metals found in background soils at SEDA. The maximum concentrations of

⁴ The concentration of a substance to which most workers can be exposed without adverse effects.

five of the seven COPC metals (all but antimony and vanadium) in SEAD-59 stockpiled soils are less than comparable metal concentrations in background soils. Additionally, five COPC metal average and 95th UCL: values (all but antimony and thallium) found in the SEAD-59 stockpiled soils are lower than SEDA background average and 95th UCL levels.

As is further shown in **Table 7-5**, the SEAD-59 stockpiled soil EPC concentrations (i.e., 95th UCL) of all identified metals, exclusive of arsenic, are less than EPA Region IX residential and industrial soil PRGs. Additionally, the SEAD-59 stockpiled soil maximum concentrations of five (aluminum, iron, manganese, thallium and vanadium) of the COPC metals are lower than the EPA Region IX residential soil PRGs, and six of the maximum COPC metal stockpiled soil concentrations (all except arsenic) are lower than the EPA's Region IX industrial soil PRGs. Finally, the SEAD-59 stockpiled soil maximum and 95th UCL concentrations for arsenic and manganese are both lower than New York's unrestricted use SCO.

Therefore, SEAD-59 remaining stockpiled soil from the excavation is not expected to cause unacceptable risks to future industrial workers or construction workers that may occupy or work in this AOC in the future.

Lead Risk Characterization

The lead risk characterization results for SEAD-59 Stockpile soil exposure are presented in **Appendix E Tables 10** and **11** for the industrial worker and construction worker, respectively. The 95th percentile PbB among fetuses of adult industrial workers are 4.7 and 7.1 µg/dL, assuming a homogeneous and a heterogeneous population, respectively. Both estimates are below the USEPA target PbB level of concern (i.e., 10 µg/dL). The 95th percentile PbB among fetuses of adult construction workers are 5.0 and 7.4 µg/dL, for a homogeneous and a heterogeneous population, respectively. Both estimates are below the USEPA target PbB level of concern (i.e., 10 µg/dL).

The lead risk characterization results for child with SEAD-59 Stockpile soil exposure are presented in **Appendix E Table 12**. It should be noted that a child resident was assumed by using the IEUBK model. As the exposure frequency for a child trespasser is much less than a child resident, the results were used as a screening tool to evaluate potential risk for the child receptor. As the 95th percentile PbB among child residents are below the USEPA target PbB level of concern (i.e., 10 µg/dL), it is concluded that lead level in SEAD-59 Stockpile soil does not pose a health risk to the child trespasser receptor.

SEAD-71 Soil and Groundwater Exposure

Carcinogenic Risks and Non Carcinogenic Hazards

Table 7-6 and **Table 7-7** summarize the cancer risks and non-cancer hazards for potential receptors due to SEAD-71 soil and groundwater exposures. Results for two RME scenarios are presented; one including all SEAD-71 soil (i.e., inside and outside of the Fenced Area, **Table 7-6**) and one considering only soil located exterior to the Fenced Area (**Table 7-7**). The risk calculation tables for all (inside and outside of the Fenced Area) SEAD-71 soil and groundwater samples are presented in **Appendix E**.

The potential cancer risks associated with all soil (i.e., inside and outside of Fenced Area) and groundwater at SEAD-71 are 1×10^{-5} for both the construction worker and the adolescent trespasser. The potential cancer risk determined for the industrial worker is 2×10^{-4} .

The cancer risks associated with soil ingestion (24%) and soil dermal contact (66%) contribute 90% to the total cancer risk determined for the industrial worker. Elevated cPAH concentrations were detected in the shallow soils collected from within the Fenced Area that is located between Building 114 and Building 127 and these compounds are the primary COPCs contributing to the cancer risk that is determined for the AOC. This area served as a secure, external storage area, and the storage pad was constructed of a combination of asphalt and crushed rock to create a firm base that could withstand vehicular traffic wear-and-tear during all kinds of meteorological conditions. Oil was applied to the crush stone portion of the base as a combination dust suppressant and soil stabilizing/compaction agent. The asphalt/crushed stone pavement is known to be as thick as 0.1 ft at several sample locations within the Fenced Area, and the surface soil samples collected from this portion of the AOC were collected either from locations beneath the pad, or from locations where breaches existed in the pad, at a depth of 0-0.2 ft bgs. Due to the location of the sample collection, it is likely that fragments of the asphalt/oil coated crushed rock became entrained in the samples and resulted in the presence of elevated levels of cPAHs.

Review of the sample data for samples collected within the Fenced Area indicate that the cPAH concentrations detected are generally elevated compared to comparable contaminant concentrations in shallow soil samples collected outside of the Fenced Area. As an example, the maximum benzo(a)pyrene concentration found within the Fenced Area is 120 mg/kg, while the maximum benzo(a)pyrene concentration detected in other portions of SEAD-71 is 22 mg/kg. Similarly, the arithmetic mean of all SEAD-71 surface soil samples (including samples interior and exterior of the Fenced Area) is 7.7 mg/kg, while the arithmetic mean of surface soil samples excluding samples within the Fenced Area is only 1.0 mg/kg.

Further analysis of the data from the Fenced Area indicates that only the surface soils are impacted by cPAHs. Using benzo(a)pyrene toxicity equivalence (BTE⁵) as a generic indicator of the level of cPAH compounds that are present in soil shows that all soil samples with BTE levels above 10 mg/kg were detected in surface soil (0-0.2 ft bgs.). The cPAH concentrations in the deeper soil samples (i.e., 1, 2.5 and 3 ft bgs) from test pit TP71-2 within the Fenced Area were at least one order of magnitude lower than the cPAH concentrations detected in surface soil samples.

Based on the above discussion, it is concluded that the elevated cPAH concentrations in surface soil within the Fenced Area at SEAD-71 are not associated with any release at the site, but are directly associated with the pavement and crushed rock pad that is still in place at the AOC. Therefore, a risk assessment was conducted for SEAD-71 in which all soil data from the Fenced Area was excluded from the risk evaluation.

⁵ BTE is used as an indicator parameter to estimate the combined toxicity of the seven carcinogenic PAHs [i.e., benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene] based on toxicity equivalency factors. Generally, the higher the BTE value the greater the potential toxicity. A 10 ppm benchmark value is usually used at Seneca to indicate potential concerns.

The results of the human health risk assessment performed for soil exterior to the Fenced Area of SEAD-71 are presented in **Table 7-7**. COPC screening, EPC evaluation, and risk calculation sheets are presented in **Appendix E** with the other risk assessment backup information.

For exposure to SEAD-71 soil and groundwater outside the Fenced Area, the cancer risks for all receptors are below the EPA upper limit of 1×10^{-4} . The total non-cancer hazard index for the adolescent trespasser is below the EPA target limit of 1. The non-cancer hazard indices for the industrial worker and construction worker are $3 \text{E}+00$ (HI = 3.5) and $1 \text{E}+01$ (13), respectively. For the industrial worker, the risk associated with groundwater intake contributes 91% (3.1) to the total non-cancer hazard index. For the construction worker, the risks associated with inhalation of dust in ambient air and groundwater intake contribute 68% (8.6) and 25% (3.1), respectively, to the total non-cancer hazard level.

A comparison of the iron and manganese concentrations in SEAD-71 groundwater with the corresponding concentrations in the Seneca groundwater background data set was conducted in accordance with the USEPA (2002b) *Guidance for Comparing Background and Chemical Concentrations in Soil for CERCLA Sites*. According to USEPA (2002b), several methods are available for comparing background to site data. These can be divided into several major categories: data ranking and plotting, descriptive summaries, simple comparison, parametric tests, and nonparametric tests. As the data set size for SEAD-71 groundwater is small (total sample number is eight), the comparison with background was conducted by comparing the descriptive statistics between the SEAD-71 groundwater data set and the SEDA background data set (see *SEAD59/71 Draft Final Phase II Remedial Investigation Report*, Appendix B, Parsons 2006).

Table 7-8 shows that the 25th percentile and the median concentrations of iron and manganese in SEAD-71 groundwater are below the corresponding concentrations in SEDA background. For iron, the arithmetic mean, the 75th percentile, and the 90th percentile of the SEAD-71 data set are greater than, but within two times of the corresponding values for the SEDA background data set. For manganese, the arithmetic mean, the 75th percentile, and the 90th percentile of the SEAD-71 data set are greater than two times of the corresponding values for the SEDA background data set. The two highest manganese hits were detected in MW71-2 and MW71-1, upgradient of the source area in SEAD-71. Monitoring well MW71-2 was dry most of the time during the groundwater sampling events (i.e., 1994 and 2004 groundwater sampling). Therefore, the manganese concentration reported for MW71-2 may be overstated due to limited water volume and potentially elevated turbidity. In general, the amount of groundwater and the rate of groundwater re-charge present at SEAD-71 is limited compared to other SEDA sites. Three of the four groundwater monitoring wells (MW71-1, -2, and -3) have measured saturation thickness of less than 4 feet during the 2004 sampling events.

In addition, the iron and manganese concentrations detected in a monitoring well downgradient and within the suspected source areas at SEAD-71 (i.e., MW71-4) are 0.023 to approximately 0.148 $\mu\text{g}/\text{L}$ and non detect (ND, reporting limit = 0.296) to approximately 0.0081 $\mu\text{g}/\text{L}$ for iron and manganese, respectively. The concentrations are below the corresponding 25th percentiles of the SEDA background data set.

Additionally, it should further be noted that it is extremely unlikely that groundwater will be used as drinking water source at SEAD-71, since there is an alternative potable water supply readily available throughout the PID Area of the Depot. Furthermore, shallow aquifer underlying both SEAD-59 and SEAD-71 is not believed to be productive enough to supply the drinking water needs at the sites.

In summary, the iron and manganese concentrations in SEAD-71 groundwater are generally comparable with the SEDA background. Elevated manganese concentrations in upgradient wells may be overstated due to limited volume and potentially elevated turbidity. The iron and manganese concentrations detected in the downgradient monitoring well are consistent with the SEDA background. Therefore, iron and manganese in SEAD-71 groundwater are not identified as COCs.

Aluminum, manganese, and naphthalene in SEAD-71 soil outside the Fenced Area are the only COPCs contributing to the non-cancer risks associated with inhalation of dust in ambient air and contribution from naphthalene being negligible (i.e., < 0.001%). As is shown in **Table 7-9**, aluminum and manganese concentrations remaining in SEAD-71 soil exterior of the Fenced Area are lower than Seneca background soils levels, and are less than federal and state guidance values that are deemed acceptable for more restricted types use (e.g., unrestricted use and residential). Like SEAD-59, SEAD-71 is located in a portion of the Depot where the future land use is intended to be commercial or industrial.

In addition to the descriptive statistics comparison, both non-parametric (Mann-Whitney T test) and parametric (Student's T test) statistical test methods were used for the background comparison analysis. One-tailed (one-sided) Mann-Whitney tests and Student's T tests were conducted. Both tests assumed 0.05 as the significance level. The statistical test results are presented in **Appendix H** of the Phase II RI Report. As shown in **Appendix H** of the Phase II RI Report, the results from the Student's T tests are consistent with the Mann-Whitney test results. Both tests conclude that the aluminum and manganese concentrations observed in SEAD-71 soils outside the Fenced Area are not statistically above the Seneca background levels.

Lead Risk Characterization

The lead risk characterization results for SEAD-71 soil exposure are presented in **Appendix E Tables 13** and **14** for the industrial worker and construction worker, respectively. The 95th percentile PbB among fetuses of adult industrial workers are 5.0 and 7.4 ug/dL, assuming a homogeneous and a heterogeneous population, respectively. Both estimates are below the USEPA target PbB level of concern (i.e., 10 ug/dL). The 95th percentile PbB among fetuses of adult construction workers are 5.5 and 8.0 ug/dL, for a homogeneous and a heterogeneous population, respectively. Both estimates are below the USEPA target PbB level of concern (i.e., 10 ug/dL).

The lead risk characterization results for child with SEAD-71 soil and groundwater exposure are presented in **Appendix E Table 15**. It should be noted that a child resident was assumed by using the IEUBK model. As the exposure frequency for a child trespasser is much less than a child resident, the results were used as a screening tool to evaluate potential risk for the child receptor. As the 95th percentile PbB among child residents are below the USEPA target PbB level of concern (i.e., 10 ug/dL), it

is concluded that lead level in SEAD-71 soil and groundwater does not pose a health risk to the child trespasser receptor.

7.2 SCREENING LEVEL ECOLOGICAL RISK ASSESSMENT (SLERA)

Screening-level ecological risk assessments (SLERAs) were also performed for SEAD-59 and SEAD-71 to evaluate whether hazardous substances found at either of the AOCs have the potential to cause adverse effects to ecological resources. The SLERAs were conducted in accordance with several USEPA and NYSDEC guidance documents including *Ecological Risk Assessment Guidance for Superfund (ERAGS): Process for Designing and Conducting Ecological Risk Assessments* (USEPA, 1997), *Guidelines for Ecological Risk Assessment* (USEPA, 1998), *Fish and Wildlife Impact Analysis* (NYSDEC, 1994b), and *The Role of Screening-Level Risk Assessments and Refining Contaminants of Concern in Baseline Ecological Risk Assessments* (USEPA, 2001b).

The current USEPA (1997) ecological risk assessment paradigm includes eight general steps:

1. Screening-Level Problem Formulation and Ecological Effects Evaluation;
2. Screening-Level Exposure Estimate and Risk Calculation;
3. Baseline Risk Assessment Problem Formulation;
4. Study Design and Data Quality Objective (DQO) Process;
5. Field Verification of Sampling Design;
6. Site Investigation and Analysis Phase;
7. Risk Characterization; and
8. Risk Management.

The ecological risk assessments completed for SEAD-59 and SEAD-71 included a screening-level ecological risk assessment (SLERA, Steps 1 and 2) and further refinement of chemicals of concern (COCs) (Step 3.2). Step 3.2, COC refinement, was performed in accordance with the USEPA's ERAGS (1997) and the supplemental guidance of ERAGS (USEPA, 2001b). The SLERA process is summarized in **Figure 7-3**.

Upon completion of screening-level Ecological Risk Assessment (ERA) Step 2, there is a Scientific Management Decision Point (SMDP) with four possible decisions according to the ERAGS (USEPA, 1997) and the supplemental guidance (USEPA, 2001b):

- There is adequate information to conclude that ecological risks are negligible and therefore there is no need for remediation on the basis of ecological risks;
- The information is not adequate to make a decision at this point and the ERA process should continue to a baseline ERA;
- The information indicates a potential for adverse ecological effects, and a more thorough assessment is warranted; or
- In cases where contamination has sharply defined borders or where the extent of contamination is limited, it may be preferable to cleanup the area to the screening values rather than spending time and resources determining a less conservative cleanup number.

The results of the SLERA indicate which contaminants found at the AOC can be eliminated from further consideration and which should be evaluated further. The refinement of COCs helps streamline the overall ERA process by considering additional components early in the baseline ERA. The results of the ecological risk assessment presented will be used to determine the need for further study. The baseline ERA, if conducted, will further evaluate potential or actual adverse ecological effects associated with site-related contaminants and results will be used to develop appropriate remedial measures, if required.

7.2.1 Ecological Conceptual Model

Preliminary CSMs were developed separately for both AOCs. Each CSM provided an overall assessment of the primary and secondary sources of contamination at the AOCs, and the corresponding release mechanisms and affected media. Potential sources of contamination; potentially complete exposure pathways; and, ecological receptors are depicted in the CSM.

A complete exposure pathway consists of a source and mechanism of contaminant release, a transport mechanism for the released contaminants, a point of contact, and a route of contaminant entry into the receptor. If any of these elements is missing, the pathway is incomplete. In addition, potential receptors were identified to allow evaluation of potentially complete pathways.

For most terrestrial receptors, soil exposure intervals are limited to the upper 2 feet of the soil column. For purposes of this SLERA, surface soil was defined as the 0-2 ft. below ground surface (bgs). Surface and subsurface soil (0-4 ft. bgs, hereafter referred to as total soil) may be uncovered during future excavation activities and therefore, may result in contaminants in the soil becoming available for contact. Therefore, exposure to deeper soil (0-4 ft. bgs depth range) was also evaluated in the SLERAs.

Ecological receptors are not directly exposed to contaminants in groundwater. Further, there are no permanent lakes, ponds, streams or wetlands in SEAD-59 or SEAD-71; therefore, aquatic receptors were not identified as potential receptors at either of the AOCs.

7.2.2 Identification of Ecological COPCs

Chemicals of potential concern (COPCs) were identified by comparing the maximum detected concentrations in each impacted medium at each AOC to ecological risk-based screening values. For each data set selected, the maximum detected concentration was compared to the ecological screening value. For soil, the maximum detected concentration of all results was used for the screening purposes, and the COPCs identified were used for both the surface soil and the deeper soil data sets. The following five data sets were used for the screening level ecological risk assessment.

- SEAD-59 surface soil (0 – 2ft bgs) data;
- SEAD-59 deeper soil (0 – 2ft bgs) data;
- SEAD-59 stockpile soil data;
- SEAD-71 surface soil (0 – 2ft bgs) data; and,
- SEAD-71 surface soil (0 – 2ft bgs) data;

The ecological screening values are based on conservative (i.e., environmentally protective) generic values derived by various agencies. In brief, the following sources (cited in order of preference) were consulted for screening value selection for soil:

- USEPA (2000a, 2003c, 2005) Ecological Soil Screening Levels;
- USEPA Region III (1995) Biological Technical Assistance Group (BTAG) Screening Levels;
- USEPA Region V (2003) Ecological Screening Levels;
- Oak Ridge National Laboratory (ORNL) Screening Benchmarks for Soil and Litter Invertebrates and Heterotrophic Process (Efroymson et al., 1997a), and Terrestrial Plants (Efroymson et al., 1997b);
- Canadian Environmental Quality Guidelines developed by the Canadian Council of Ministers of the Environment (2003); and
- Circular on Target Values and Intervention Values for Soil Remediation developed by the Netherlands (2000).

Constituents with maximum detected concentrations exceeding the corresponding screening values were retained as COPCs. With the exception of the nutrients (i.e., calcium, magnesium, potassium, and sodium), constituents with no screening values available were retained as COPCs. In addition, all bioaccumulative compounds identified in the report *Bioaccumulation Testing and Interpretation for the Purpose of Sediment Quality Assessment* (USEPA, 2000) as important bioaccumulative compounds were retained as COPCs as a conservative approach, which is consistent with the ecological risk assessment guidance set forth by USEPA for the Mid-Atlantic Hazardous Site Cleanup program.

7.2.3 Assessment Endpoints

The assessment endpoints selected for the SLERA were the survival and reproduction of wildlife populations (associated with suitable habitat) that may be affected by previous SEAD-59 and SEAD-71 site operations. Specifically, assessment endpoints were provided for populations at two trophic levels: small mammals and ground-feeding birds, and higher level predators. The assessment endpoints are addressed through the survival and reproduction of mammal and bird populations at the AOCs.

7.2.4 Receptors

The following species were selected as ecological receptors for SEAD-59 and SEAD-71. These species were selected because they either have been observed at, or are likely to be present in the vicinity of the AOCs and the Depot, given habitat conditions.

- Deer mouse (*Peromyscus maniculatus*);
- Short-tail shrew (*Blarina brevicauda*);
- Red fox (*Vulpes vulpes*); and,
- American robin (*Turdus migratorius*).

7.2.5 Characterization of Exposure Pathways

The identified ecological receptors are potentially exposed to COPCs in the soil via soil ingestion and biota intake. The most likely exposure interval for which characterization data were collected is shallow soils (0 to 2 ft. bgs), where receptor exposure could result from surface-foraging, shallow burrowing, and due to uptake by many forage plants (e.g., grasses and forbs). The 0 to 4 foot bgs soil interval was also assessed to assess potential future burrowing and deep-rooted plant site conditions. Animals may be exposed directly to site-related contaminants through ingestion, dermal contact and inhalation. In addition, animals may be indirectly exposed to site-related contaminants through ingestion of plants, invertebrates and other animals that have bioaccumulated chemicals.

7.2.6 Screening-Level Effects Evaluation

The SLERA for mammalian and avian receptors was conducted by comparing potential exposures to COPCs to screening ecotoxicity values (SEVs). SEVs for those analytes identified as COPCs were derived from studies reported in the literature, in the absence of site-specific data, by establishing data selection criteria such that SEVs would be as relevant as possible to assessment endpoints at the sites. In accordance with USEPA guidance (1997), the lowest available, appropriate toxicity values were used with modifying factors to ensure a conservative (i.e., health protective) screening-level evaluation.

7.2.7 Screening-Level Exposure Estimate

Estimates of contaminant exposures, expressed as daily dose ingested of contaminated food items (i.e., plants, invertebrates, and animals) and media, were calculated to compare potential wildlife exposures to adverse effect levels. COPC daily dose ingested (expressed as the mass of COPC ingested per kilogram body weight per day) depends on the COPC concentration in food items and media, the receptor's trophic level, the trophic level of food items, and the receptor's ingestion rate of each food item and media.

USEPA (1993b, 1999b, and 2005) has provided a variety of exposure information for numerous avian and mammalian species. Data are directly available for body weights of various species. Similarly, information regarding feeding rates, and dietary composition, including incidental soil ingestion, are also available for many species. Such exposure parameters were compiled for the selected receptor species (i.e., deer mouse, short-tailed shrew, red fox, and American robin). Feeding rates for receptors were based upon USEPA (1999b, 2005) or allometric equations presented in Nagy (1999). Literature values for diet fraction and body weights were taken from USEPA (1993b, 1999b, 2005).

For the screening-level exposure estimate, site foraging frequency factors for all receptors were assigned as 1, in accordance with the USEPA (1997) guidance. That is, all receptors were assumed to be exposed 100% of the time to the COPCs at the AOC. This is a very conservative assumption as most receptors will spend at least part of the time outside of the AOC boundaries, either by having a larger home range than the AOC area, seasonal migration patterns, and/or winter dormancy periods. For example, the red fox has a much larger foraging range than the size of either SEAD-59 or SEAD-71 (i.e., over 200 acres vs. approximately 6 and 2.5 acres, respectively), yet the SLERA assumes that the fox spends all of its time at SEAD-59 or SEAD-71.

The soil-to-plant uptake factors and soil-to-soil invertebrate uptake factors were obtained from the “*Screening Level Ecological Risk Assessment Protocol for Hazardous Waste Combustion Facilities*” (USEPA 1999b). Small mammal bioaccumulation factors were obtained from published literature or were calculated based on chemical-specific partitioning coefficients provided in the literature.

The exposure point concentration (EPC) evaluated for each soil COPC was determined based on the maximum detected concentration, in accordance with the USEPA (1997) guidance.

7.2.8 Screening-Level Risk Calculation

For wildlife receptors, the risk calculation step uses the results of the wildlife exposure and toxicity effects assessments to calculate a hazard quotient for each COPC. A hazard quotient (HQ) is a ratio of the estimated exposure dose (for mammal and bird receptors) of a contaminant to the SEV. Generally, the greater this ratio or quotient, the greater the likelihood of an effect. A HQ less than 1 indicates that the contaminant alone is unlikely to cause adverse ecological effects. Because conservative (i.e., health protective) estimates of potential chronic exposures and toxicity were used, screening-level HQs tend to overestimate actual risks. Cumulative effects of COPCs were not quantitatively evaluated in this SLERA.

For the screening level ERA, NOAEL toxicity values, the maximum detected COPC concentrations, and conservative exposure assumptions were used to calculate the screening level HQs. Each of these assumptions adds to the conservative nature of the HQ calculated.

7.2.9 Further Refinement of Chemicals of Concern

Due to the conservative nature of the assumptions used in the screening-level ecological risk assessment, additional evaluation was completed to refine the contaminants of concern. The refinement of COCs streamlines the overall ERA process to determine if further evaluation is warranted. Lines of evidence (COC refinement) evaluated include:

- COC detection frequency;
- Risk results based on reasonable site average concentration and/or LOAEL SEVs;
- Size of site relative to foraging area of receptors;
- Site risk relative to background risk;
- Relative uncertainties of SLERA results;
- Sufficiency and quality of literature toxicity data and experimental designs;
- Strength of cause/effect relationships; and
- Quality of habitat for receptors.

Alternative toxicity values and mean exposures based on mean concentrations of contaminants detected in a media at an AOC were considered for the refinement of COCs. Utilizing the mean concentration instead of the maximum concentration presents a more realistic approach to evaluate exposure for a receptor that comes into contact with a COPC. The receptor is likely to range over the entire site and not be continuously exposed to the maximum concentration at all times. Thus, the mean is more

representative of the actual exposure concentration for a receptor to contact on a continual basis. This additional risk characterization performed as part of the ERA Step 3, together with the other lines of evidence, can be used to refine the COCs and support a decision for either additional evaluation or no further evaluation of environmental risk.

In accordance with the USEPA ERAGs, this SLERA was conducted using very conservative assumptions. Therefore, as completed, the SLERA is likely to lead to a n overestimation of the risks posed to the ecosystem. The following briefly highlights three factors that may heavily impact the degree of conservatism that is built into the SLEAR.

Relative Bioavailability

The relative bioavailability of contaminants found at SEAD-59 and SEAD-71 were assumed to be 100% during the SLERA. However, contaminants in environmental media are generally less available to biological organisms compared with the same contaminants in the experimental medium (i.e., diet, water, etc.).

Site Foraging Frequency Factor

The site foraging frequency factors (or area-use factors) were assumed to be 1 for the mammalian receptors, and 100% for the avian receptors for the avian receptors at both AOCs. That is, the receptors were assumed to live within each AOC at all times, and not range or forage beyond the boundaries of the AOC being evaluated. Again, this is a very conservative assumption as most ecological receptors will spend at least part of the time outside of the AOC boundaries, either by having a larger home range than the AOC area, seasonal migration patterns, and/or winter dormancy periods.

A site foraging frequency factors of 0.03 would be more appropriate for the red fox for SEAD-59. Similarly, a site foraging frequency factor of 0.5 would be a more appropriate estimate for the American robin.

NOAEL/LOAEL Multiplier

A NOAEL is preferred to a LOAEL as a screening ecotoxicity value to ensure that risk is not underestimated (USEPA, 1997). However, NOAELs currently are not available for many groups of organisms and many chemicals. When a LOAEL value, but not a NOAEL value, is available from the literature, a standard practice is to multiply the LOAEL by a NOAEL/LOAEL multiplier (0.1) and to use the product as the NOAEL for the screening evaluation. Although a NOAEL/LOAEL multiplier of 0.1 was used, the true NOAEL may be only slightly lower than the experimental LOAEL, particularly if the observed effect is of low severity (Sample et al., 1996). The data review referred to in the ERAGS that is used to support the use of 0.1 as the NOAEL/LOAEL multiplier indicates that 96% of chemicals included in the review had a NOAEL/LOAEL multiplier no less than 0.2. Therefore, using a default NOAEL/LOAEL multiplier of 0.1 may result in an overestimation of the HQs. LOAEL values were used in Step 3.2 as alternative SEV values.

Maximum Detected Concentration

The use of the maximum detected concentration as the EPC may overestimate risk since the receptor is actually exposed to a broader range of contaminant concentrations rather than the maximum detected concentrations. Exposure would occur throughout the AOC at various levels, including the EPC. Thus, actual risks may be lower than those presented in the assessment.

7.2.10 Ecological Risk Assessment

Ecological communities identified at SEAD-59/71 include successional old field areas, successional shrub areas, and successional hardwoods areas. Animals that have been identified at the Depot during various ecological surveys include beaver, eastern coyote, deer, red and gray fox, eastern cottontail rabbit, muskrat, raccoon, gray squirrel, striped skunk, and the woodchuck. Bird species that have been identified include the blue jay, black-capped chickadee, American crow, mourning dove, northern flicker, ruffed grouse, ring-billed gull, red-tailed hawk, northern junco, American kestrel, white breasted nuthatch, ring-necked pheasant, American robin, eastern starling, turkey vulture, and pileated woodpecker.

The NYSDEC Natural Heritage Program Biological and Conservation Data System identifies no known occurrences of federal- or state-designated threatened or endangered plant or animal species within a 2-mile radius of the SEDA. No species of special concern are documented within the Depot property. No rare or endangered species have been observed during the site assessment.

A SLERA was conducted and the results indicate that soil at SEAD-59, SEAD-71, and in SEAD-59 stockpiled soil does not significantly impact ecological receptors in the area (i.e., deer mouse, American robin, short-tailed shrew, and red fox). No COCs were identified for SEAD-59 soil, SEAD-59 stockpiled soil, or SEAD-71 soil for ecological receptors.

7.3 SUMMARY OF HUMAN HEALTH AND ECOLOGICAL RISKS

The results of the risk assessment indicate that contaminants associated with releases at SEAD-59 and SEAD-71 do not pose unacceptable risks to the industrial receptors. However, there is a potential that risks would exist for residential users, if the land was subsequently reclassified for either residential or unrestricted use.

In-situ soil at SEAD-59 and SEAD-71, and stockpiled soil in SEAD-59 do not significantly impact ecological receptors in the areas.

7.4 BASIS FOR ACTION

Based upon the ecological evaluation, it is concluded that there is no significant risk identified for potential ecological receptors at SEAD-59 and SEAD-71. The human health risk assessment results indicate that contaminants associated with releases at SEAD-59 and SEAD-71 do not pose unacceptable risks to the industrial receptors; therefore, SEAD-59 and SEAD-71 are suitable for the continued use as a commercial or industrial area and stockpiled soil may be left at SEAD-59 because it poses no undo risk to future industrial receptors. There is a potential that unacceptable levels of human health risks could exist at SEAD-59 or 71 if this land were subsequently released for unrestricted use.

8.0 REMEDIAL ACTION OBJECTIVES

Remedial action objectives are specific goals to protect human health and the environment. These objectives are based on available information and standards such as ARARs and risk-based levels established in the risk assessment. These objectives are also based upon current and intended future land use, which is Planned Industrial/Office Development and Warehousing for SEAD-59 and SEAD-71.

Remedial action objectives have been developed that consist of media-specific objectives for protection of human health and the environment. NYSDEC's General Remedial Program goal is to restore a specific site to pre-disposal conditions, to the extent feasible. Unrestricted land use was considered at SEAD-59 and SEAD-71 to compare the costs of remediating the AOCs to this level of use versus the costs to implement a more restricted land use. Unrestricted use was also considered to comply with Army guidance, which states that alternatives consistent with property use without any restriction should be considered to compare life-cycle institutional control costs with more conservative cleanup alternatives (DAIM-BO, *Army Guidance for Using Institutional Controls in the CERCLA Process*).

Remedial action objectives are specific goals to protect human health and the environment; they specify the contaminant(s) of concern, the exposure route(s), receptor(s), and acceptable contaminant level(s) for each exposure route. These objectives are based on risk levels established in the risk assessment and should comply with ARARs, unless a waiver is obtained. A list of ARARs, TBCs, and other guidance is provided in **Appendix F**.

Select hazardous substances and other contaminants are still present in the soil that remains at SEAD-59 and SEAD-71 at concentrations that prohibit unrestricted use and unlimited exposures. Results of the risk assessments completed for the two AOCs indicate that the levels of contaminants that are present will allow for its continued use as a commercial or industrial site, which is consistent with SCIDA's current land use designation for the PID Area.. Further, hazardous substances and other contaminants are present in the groundwater at SEAD-71 at concentrations that are above the State of New York's GA groundwater standards. Additionally, results of the human health risk assessment indicates that the presence of these hazardous substances and contaminants in the groundwater at SEAD-71 poses an elevated non-cancer hazard. Therefore, the groundwater at SEAD-71 is not an appropriate source of potable water. The levels of certain hazardous substances and other contaminants found in the groundwater at SEAD-59 also exceed New York's GA groundwater standards, but are not at sufficient concentrations to suggest that elevated cancer risks or non-carcinogenic hazards would results from its use.

Given this information the remedial action objectives for SEAD-59 and SEAD-71 are as follows:

- Reduce or eliminate future user direct contact, ingestion and the inhalation threats to soils containing hazardous substances; and,
- Prevent exposures of future users to groundwater that may contain hazardous substances and other pollutants and contaminants.

9.0 DESCRIPTION OF ALTERNATIVES

CERCLA § 121(b)(1), 42 U.S.C. § 9621 (b)(1) and the NCP require that each selected remedy be protective of human health and the environment, be cost effective, comply with ARARs, and use permanent solutions, alternative treatment technologies, and resource recovery options to the maximum extent possible. Section 121(b)(1) also establishes a preference for remedial actions which employ, as a principal element, treatment to permanently and significantly reduce the volume, toxicity, or mobility of the hazardous substances, pollutants and contaminants at a site.

Two remedial alternatives were considered for groundwater at SEAD-59 and SEAD-71. These included:

- Groundwater Alternative 1: No Action
- Groundwater Alternative 2: Groundwater Access/Use Restriction

The concepts, provisions, requirements, and costs associated with both of the groundwater alternatives (GwAs) discussed for SEAD-59 and SEAD-71 are identical.

Three alternatives were considered for soil in each of the AOCs based on the USEPA and NYSDEC policies and based on conditions identified in the AOCs. The three soil remedial alternatives are listed below. Requirements, considerations, concepts and costs associated with the implementation of Soil Alternative 1 (SA 1) are identical for SEAD-59 and SEAD-71. There are slight differences in provisions of the other two soil alternatives (SAs 2, 3a, and 3b) defined for SEAD-59 and SEAD-71.

- Soil Alternative 1: No Action;
- Soil Alternative 2: Soil Excavation, Off-Site Treatment/Disposal and Soil Backfill to Achieve Unrestricted Use SCOs (discussions presented separately for SEAD-59 and SEAD-71);
- Soil Alternative 3a1: Implementing Land Use Controls that Prohibit Residential Housing, Elementary or Secondary Schools, Childcare Facilities or Playgrounds (SEAD-59 only); or
- Soil Alternative 3a2: Interring Residual Excavated Soil under a Protective Cover and Implementing Land Use Controls that Prohibit Unauthorized Excavation, and that Prohibit Residential Housing, Elementary or Secondary Schools, Childcare Facilities or Playgrounds (SEAD-59 only); or
- Soil Alternative 3b: Implementing Land Use Controls that Prohibit that Prohibit Residential Housing, Elementary or Secondary Schools, Childcare Facilities or Playgrounds (SEAD-71 only).

Detailed descriptions of the soil and groundwater remedial alternatives considered to address the contamination found associated with the individual AOCs are presented below. The construction time for each alternative reflects only the time required to construct or implement the remedy and does not include time required to design the remedy or procure contracts for design and construction. The costs of the alternatives are calculated using a discount rate of seven percent (7%) and a 30-year time interval.

Once all alternatives have been identified and described, each of the alternatives has been evaluated against the NCP's evaluation criteria which are:

- Overall protectiveness of the public health and the environment;
- Compliance with ARARs;
- Long-term effectiveness and permanence;
- Reduction in toxicity, mobility or volume of contamination through treatment;
- Short-term effectiveness;
- Implementability;
- Community acceptance;
- State acceptance; and
- Cost-effectiveness.

The comparative evaluation of the varying alternatives is summarized in **Section 10** of this Record of Decision.

9.1 GROUNDWATER ALTERNATIVES

9.1.1 Groundwater Alternative 1 (GwA 1) – No Action

The Superfund program requires that the “no-action” alternative be considered and serve as the baseline to which other alternatives evaluated are compared. The “no action” remedial alternative for groundwater does not include the design or implementation of any remedial measures to address types of groundwater contamination identified.

Application of the no action alternative at SEAD-59 and SEAD-71 will allow for contaminants, including hazardous substances, to remain in the groundwater at concentrations above levels that permit unrestricted use and unlimited exposures. As such, CERCLA requires that conditions at the AOCs be reviewed at least once every five years to assess whether changes are occurring, which require further consideration or action. If justified by the periodic reviews, subsequent remedial actions may be implemented to remove, treat, or contain the contaminated groundwater. The costs associated with the application of the “no action” alternative for groundwater are identified below.

SEAD-59 and SEAD-71, GwA 1 (No Action) Costs

Capital Cost:	\$0
Annual Operation, Maintenance, and Monitoring (OM&M) Costs (groundwater):	\$0
Present-Worth Costs:	\$0
Construction Time:	0 months
Completion Time	0 months

9.1.2 Groundwater Alternative 2 (GwA 2) – Groundwater Access/Use Restriction

This alternative is generally equivalent to GwA 1, except in this case the remedy will impose the groundwater access/use restriction that has been implemented over land in the PID Area that has been transferred to the SCIDA. The groundwater access/use restriction was not previously imposed on SEAD-59 and SEAD-71 because they were retained by the Army, pending completion of their CERCLA regulatory process. Given the results obtained for the two AOCs that define the groundwater quality present in SEAD-59 and SEAD-71, the groundwater access/use restriction should be formally imposed on both of the AOCs.

The decision to apply the PID Area-wide groundwater use/access restriction at SEAD-59 and SEAD-71 will not adversely affect the future usability of the AOCs because a municipal, potable water distribution system, which derives its raw water from a non-groundwater source, is available within the entire PID Area. The presence of this alternative supply of domestic water reduces the need to consider use of groundwater underlying the PID Area.

The existing PID Area-wide groundwater access/use restriction was implemented due to the groundwater quality conditions identified in SEADs 27, 64A, and 66, which are reported and summarized in the *Final ROD for Sites Requiring Institutional Controls in the Planned Industrial/Office Development or Warehousing Areas* (Parsons, 2004). Under the 2004 PID Area-wide ROD, the groundwater restriction will be implemented for those properties within the PID Area that are the subject of the 2004 PID ROD to prohibit access to and use of the groundwater. This restriction may be removed at specific AOCs or specific portions of the PID Area if, and when, groundwater constituent concentrations are reduced at such areas to levels that allow for unrestricted exposure and unrestricted use.

The application of this groundwater remedy at SEAD-59 and SEAD-71 will allow for certain chemicals, including CERCLA-regulated hazardous substances, to remain at concentrations above levels that permit unrestricted use and unlimited exposures at both of the AOCs. As such, CERCLA requires that the remedy for the AOCs be reviewed at least once every five years to assess whether changes have occurred, which require further consideration or action. If justified by the periodic reviews, subsequent remedial actions may be implemented to remove, treat or contain the contaminated groundwater. The likely costs associated with application of this alternative individually, for groundwater at each of the AOCs is summarized below.

SEAD-59 and SEAD-71, GwA 2 (Groundwater Restriction) Costs

Capital Cost:	\$0
Annual OM&M Costs (groundwater):	\$3,000
Present-Worth Costs:	\$37,230
Construction Time:	0 months
Completion Time	1 month

9.2 SOIL ALTERNATIVES

9.2.1 Soil Alternative 1 (SA 1) – “No Action”

Like is the case for groundwater, the “no action” remedial alternative for soil does not include the design or implementation of any physical remedial measures to address types of soil contamination that has been identified at the two AOCs. The “no-action” alternative (SA 1) is identical for work that might be considered at either SEAD-59 or SEAD-71.

Application of this alternative would allow for hazardous substances at concentrations above levels that permit unrestricted use and unlimited exposures to remain in the soils at both of the AOCs. As such, CERCLA requires that conditions at the AOCs be reviewed at least once every five years to assess whether changes are occurring at the AOCs. If justified by the periodic reviews, subsequent remedial actions may be implemented to remove, treat or contain the contaminated soils.

SEAD-59 and SEAD-71, SA 1 (No Action) Costs

Capital Cost:	\$0
OM&M Costs (soil)	\$0
Present-Worth Costs:	\$0
Construction Time:	0 months
Completion Time	0 months

9.2.2 Soil Alternative 2 (SA 2) – Excavation of Soil to Achieve Unrestricted Use Cleanup Objectives, Off-Site Treatment/Disposal, and Soil Backfill

SEAD-59 (SA 2a)

This alternative involves the excavation of soil containing hazardous substances at levels in excess of the New York’s Unrestricted Use SCO levels. A summary listing of contaminants identified in current soils at SEAD-59 at concentrations in excess of New York’s Unrestricted Use SCOs is provided in **Table 6-1a** for in-situ soils and **Table 6-5** for excavated soil that remains at the site in stockpiles.

Due to the elevated cPAH concentrations contained in the backfilled windrow samples, all the previous backfill areas at SEAD-59 will need to be re-excavated and the soil removed to meet the New York Unrestricted Use SCOs. Further, other areas at SEAD-59 would need to be excavated to meet the New York Unrestricted Use SCOs. The estimated volume of contaminated soil from backfilled and previously unexcavated locations is approximately 16,400 cubic yards (cy).

Carcinogenic PAHs, three pesticides (4,4’-DDT, 4,4’-DDE, and 4,4’-DDD), and two metals (lead and nickel) were found with the site-wide concentrations exceeding the corresponding NYSDEC Unrestricted Use SCOs in the stockpiled SEAD-59 soils. The Army anticipates that all of the stockpiled soil remaining from the TCRA excavation (i.e., 5,428 cy) would need to be disposed off-site to achieve the Unrestricted Use SCOs.

All of the excavated soil and the TCRA stockpiled soil (i.e., 16,400 cy and 5,428 cy) would be characterized and transported for disposal at off-site landfills. Water generated from the storm events that

flows into excavation areas would be captured and pre-treated on-site, as necessary. It would be discharged to the Seneca County Wastewater Treatment Facility in conformance with their requirements.

Once the excavation was completed and its extent confirmed by the collection and analysis of confirmatory samples, the area of the excavation would be backfilled, compacted, and graded.

Once this action was completed, the land excavated would be appropriate for unrestricted use and unlimited exposures.

SEAD-59 SA 2a (Unrestricted Use) Costs

Capital Cost	\$2,182,800
Annual OM&M Cost (soil)	\$0
Present-Worth Costs:	\$2,182,800
Construction Time	6 Months
Completion Time	12 Months

SEAD-71(SA 2b)

Again this alternative involves the excavation of soil containing substances at levels in excess of the New York's Unrestricted Use SCO levels. A summary listing of contaminants identified in current soils at SEAD-71 at concentrations in excess of New York's Unrestricted Use SCOs is provided in **Tables 6-10a** for all soils and in **Table 6-14a** for SEAD-71 soils that are exterior of the Fenced Area..

All of the previous areas backfilled with excavated soil from the TCRA at SEAD-71 would be re-excavated and the soil would be removed to meet New York's Unrestricted Use SCOs due to residual levels of cPAH compounds that are present in the backfill. Further three surface areas located in SEAD-71 would be excavated to a depth of one foot to achieve the New York Unrestricted Use SCOs: the Fenced Area (28,000 ft²) and two areas to the west of the Fenced Area – one to the north of the unnamed dirt road (1,500 ft²) and the other encompassing the dirt road (17,500 ft²). Soil associated with two test pit locations within these areas (TP71-1 and TP71-2) would be excavated to a greater depth (4 ft and 3.5 ft, respectively) to achieve the New York's Unrestricted Use SCOs. Based on these dimensions, the estimated volume of contaminated soil requiring excavation and removal from SEAD-71 is approximately 2,400 cy.

All excavated soil would be characterized and transported for disposal at off-site landfills. Water generated from the storm events that flows into excavation areas would be captured and treated on-site, as necessary. It would be discharged to the Seneca County Wastewater Treatment Facility in conformance with their requirements.

Once the excavation was completed and its extent confirmed by the collection and analysis of confirmatory samples, the area of the excavation would be backfilled, compacted, and graded.

Once this action was completed, the land excavated would be appropriate for unrestricted use and unlimited exposures.

SEAD-71 SA2b (Unrestricted Use) Costs

Capital Cost	\$240,000
Annual OM&M Cost (soil)	\$0
Present-Worth Costs:	\$240,000
Construction time	3 Months
Completion Time	12 Months

9.2.3. Soil Alternative 3 (SA 3) – Land Use Controls**9.2.3.1 SEAD-59 Soil Alternatives 3a1 (SA3a1) - Implementing Land Use Controls or Soil Alternative 3a2 - Interring Excavated Soil Beneath a Protective Cover and Implementing Land Use Controls**

The Army compared the analytical results obtained for soil left (i.e., non-stockpiled) in place at SEAD-59 to New York's Restricted Commercial and Industrial Use SCOs and conducted human health and ecological risk assessments based on sampling results for SEAD-59, in accordance with Superfund guidance. The comparison of AOC-wide 95th UCL values for all identified hazardous substances and contaminants, except benzo(a)pyrene, are below the State's SCOs. The AOC-wide 95th UCL value for benzo(a)pyrene is between the State's Commercial and Industrial Use SCOs. The AOC-wide 95th UCL for several hazardous substances exceeds the State's Residential and Unrestricted Use SCOs.

The results of the risk assessment performed in accordance with CERCLA guidance indicate that there are no significant risks identified for potential ecological receptors, and that SEAD-59 is suitable for continued use as commercial and industrial land. However, it is likely that there are potential risks and hazards present for other non-commercial/industrial populations due to contaminants identified in the soils and groundwater in SEAD-59. As a result, institutional controls in the form of land use restrictions that prohibit the use of the land for residential housing, elementary and secondary schools, childcare facilities and playgrounds will need to be implemented for the land comprising SEAD-59.

The results of the human health risk assessment also indicate that excavated soils from SEAD-59 and SEAD-71 remaining in stockpiles at SEAD-59 do not pose unacceptable risks to future commercial and industrial populations, and can therefore be left at the AOC, which will continue to be used for commercial or industrial uses.

Alternative SA3a1 (Leave Soil Stockpiled and Land Use Controls)

Since the risk assessment indicates that the stockpiled soil at SEAD-59 does not pose elevated risk to current and future commercial or industrial populations, and the continuing planned use for the SEAD-59 area is as commercial or industrial land, the soil may be left in stockpiles and a land use control that prohibits the use of the land for residential housing, elementary and secondary schools, childcare facilities, and playgrounds will be implemented, monitored, and maintained on the land located within the bounds of SEAD-59.

It is estimated that alternative SA3a1 for SEAD-59 would take approximately one month to implement. Contaminants above levels that allow for unrestricted use and unlimited exposures will remain at the

AOC under this alternative. Therefore, CERCLA requires that the AOC be reviewed at least once every five years. If justified by the review, further remedial actions may be implemented to remove or treat the identified wastes.

Alternative 3a2 (Inter Stockpiled Soils under Multi-layered Cap and Land Use Controls)

In spite of the demonstration that the soil staged in stockpiles at SEAD-59 does not pose additional risks to future commercial and industrial uses of the AOC, the USEPA and the NYSDEC have asked that this soil be spread out over the ground at SEAD-59 and then over-covered with a layer of demarcation fabric and 12-inches of soil that meets New York's Commercial SCO levels. Under this alternative, the stockpiled soil remaining at SEAD-59 would be spread out over a portion of the AOC in a manner that would promote positive drainage, covered with a layer of demarcation fabric that extended beyond the bounds of the spread soils, and then over-covered with 12-inches of clean fill that meets New York's Restricted Commercial Use SCO levels. The entire area would then be compacted and graded to promote positive surface water run-off flow. Once this action was completed, the bounds of the area containing the spread stockpiled soils would be surveyed and recorded, and a LUC that prohibits unauthorized excavations or activities that are likely to disturb the soil cap and the demarcation fabric would be implemented, monitored, and maintained over the area where the stockpiled soils were interred. In addition, a second LUC that prohibits residential housing, elementary or secondary schools, childcare facilities, or playgrounds would be implemented, monitored, and maintained over the land located within the entire AOC.

It is estimated that alternative SA3a2 for SEAD-59 would take approximately two months to implement. Contaminants above levels that allow for unrestricted use and unlimited exposures will remain at the AOC under this alternative. Therefore, CERCLA requires that the AOC be reviewed at least once every five years. If justified by the review, further remedial actions may be implemented to remove or treat the identified wastes.

SEAD-59 SA 3a1 (Leave Soil Stockpiled and Land Use Controls) Costs

Capital Cost	\$0
Annual OM&M Cost (soil)	\$3,000
Present Worth Cost	\$37,230
Construction time	0 Month
Completion Time	1 Months

SEAD-59 SA 3a2 (Inter Stockpiled Soil and Land Use Controls) Costs

Capital Cost	\$35,000
Annual OM&M Cost (soil)	\$3,000
Present Worth Cost	\$72,230
Construction time	2 Months
Completion Time	6 Months

9.2.3.2 SEAD-71 Soil Alternative 3b (SA 3b) – Implementing Land Use Controls

The Army conducted human health and ecological risk assessments for SEAD-71 in accordance with Superfund guidance. There is no significant risk identified for potential ecological receptors at SEAD-71. The results of the human health risk assessment indicate that SEAD-71 is suitable for continued use as an industrial area. However, contaminants above levels that permit unrestricted use and unlimited exposures will still remain in the soil at the AOC. As such, LUCs that prohibit use of the property for residential housing, elementary and secondary schools, childcare facilities and playgrounds will be implemented on land comprising SEAD-71.

It is estimated that this alternative will take approximately one month to implement. Contaminants above levels that allow for unrestricted use and unlimited exposures will remain at the AOC under this alternative. Therefore, CERCLA requires that the AOCs be reviewed at least once every five years. If justified by the review, further remedial actions may be implemented to remove or treat the identified wastes.

SEAD-71 Soil Alternative 3b and Groundwater Alternative 1 Costs

Capital Cost:	\$0
OM&M Costs (soil)	\$3,000
Present-Worth Costs:	\$37,230
Construction Time:	0 months
Completion Time	1 month

10.0 COMPARATIVE ANALYSIS OF ALTERNATIVES

During the detailed evaluation of remedial alternatives, each alternative is assessed against nine evaluation criteria, namely, overall protection of human health and the environment, compliance with applicable or relevant and appropriate requirements, long-term effectiveness and permanence, reduction of toxicity, mobility, or volume through treatment, short-term effectiveness, implementability, cost, and state and community acceptance. The evaluation criteria are described below.

- Overall protection of human health and the environment addresses whether or not a remedy provides adequate protection and describes how risks posed through each exposure pathway (based on a reasonable maximum exposure scenario) are eliminated, reduced, or controlled through treatment, engineering controls, or institutional controls.
- Compliance with ARARs addresses whether or not a remedy would meet all of the applicable or relevant and appropriate requirements of other federal and state environmental statutes and requirements or provide grounds for invoking a waiver.
- Long-term effectiveness and permanence refers to the ability of a remedy to maintain reliable protection of human health and the environment overtime, once cleanup goals have been met. It also addresses the magnitude and effectiveness of the measures that may be required to manage the risk posed by treatment residuals and/or untreated wastes.
- Reduction of toxicity, mobility, or volume through treatment is the anticipated performance of the treatment technologies, with respect to these parameters, a remedy may employ.
- Short-term effectiveness addresses the period of time needed to achieve protection and any adverse impacts on human health and the environment that may be posed during the construction and implementation period until cleanup goals are achieved.
- Implementability is the technical and administrative feasibility of a remedy, including the availability of materials and services needed to implement a particular option.
- Cost includes estimated capital and OM&M costs, and net present-worth costs.
- State acceptance indicates if, based on its review of the RI/FS and Proposed Plan, the state concurs with the preferred remedy at the present time.
- Community acceptance will be assessed in the ROD and refers to the public's general response to the alternatives described in the Proposed Plan and the RI/FS reports.

A comparative analysis of these alternatives based upon the evaluation criteria noted above follows.

10.1 OVERALL PROTECTIVENESS OF HUMAN HEALTH AND THE ENVIRONMENT.

Soil Alternative (SA) 1 is not protective of human health or the environment since it does not address the soils found to contain hazardous substances at concentrations above those that allow for unrestricted use and unlimited exposures. SA 2 is protective of human health and the environment as its objective is to remove all soil that contains contaminants in excess of State levels that would allow for unrestricted use

and unlimited exposures. SA 3a1, 3a2, and 3b are protective of human health for the reasonably anticipated future land use of the two AOCs, which is industrial or commercial use.

Groundwater Alternative (GwA) 1 is not protective of human health or the environment since it does not address the contaminants identified in groundwater that have been found at concentrations above those that allow for unrestricted use and unlimited exposures. GwA 2 is protective of human health since it does acknowledge that contaminants are present at levels above those that allow for unrestricted use and unlimited exposures, and therefore, prohibits access to or use of the groundwater for all purposes.

10.2 COMPLIANCE WITH ARARS

There are currently no promulgated Federal standards for hazardous substance levels in soils, and risk-based decisions are used to determine if cleanup is warranted or necessary. New York has promulgated Remedial Program Requirements, which include numeric soil cleanup objectives for five categories of future land use (i.e., Unrestricted, Residential, Restricted-Residential, Commercial, and Industrial), as well as procedures for proposing alternative cleanup objectives for waste sites located within its bounds. These requirements were considered in connection with the selection of the remedy in this Record of Decision.

SA 1 does not address New York's Remedial Program Requirements SCOs or alternative procedures. SA 2 for both AOCs is intended to achieve New York's Unrestricted Use SCOs, and as such, it represents the alternative that would most likely allow for unrestricted use and unlimited exposures at both of the AOCs. SAs 3a1, 3a2, and 3b allow for restricted commercial/industrial uses and exposures at both SEAD-59 and SEAD-71.

New York designates all groundwater as a possible source of drinking water. Further, New York has promulgated standards for groundwater that is designated as GA levels. Several hazardous substances or contaminants were identified in the groundwater samples collected at SEAD-59 and SEAD-71 at levels that exceed New York's GA groundwater standards. Finally, the generally poor quality of the PID Area-wide groundwater has already been identified and acknowledged, and access to and use of the groundwater has been prohibited by remedial actions defined in a separate ROD that was finalized in 2004 [*Final ROD for Sites Requiring Institutional Controls in the Planned Industrial/Office Development or Warehousing Areas* (Parsons, 2004)].

GwA 1 does not address New York's groundwater standards, and does not place any restriction that prohibits the use of the groundwater at the AOCs. GwA 2 also does not address New York's GA groundwater standards, but it does recommend that the general PID Area-wide groundwater access/use restriction be formally placed on SEAD-59 and SEAD-71.

10.3 LONG-TERM EFFECTIVENESS AND PERMANENCE

SA 1 is not effective in eliminating the exposure to contaminants identified in soil at either SEAD-59 or SEAD-71. SA 2 demonstrates the highest degree of long-term effectiveness for soil, as all soil that contains contaminants in excess of New York's Unrestricted Use SCOs will be excavated and removed from the AOCs. SAs 3a1 (Leave Soil Stockpiled /Land Use Controls), 3a2 (Inter Stockpiled Soil/Land Use Controls) and 3b will impose LUCs at SEAD-59 and SEAD-71 to prohibit future residential housing,

elementary or secondary schools, childcare facilities, or playgrounds;; which will provide some level of long-term protection against likely exposures, but does not provide a permanent solution. SA 3a2 (Inter Stockpiled Soils) will impose two soil LUCs at SEAD-59, one to prohibit unauthorized excavations or activities that disturb the interred stockpiled soils and the other to prohibit future residential housing, elementary or secondary schools, childcare facilities, or playgrounds. Again, both of these LUCs will provide some level of long-term protection against likely exposures, but they do not provide a permanent solution.

GwA 1 is expected to have minimal long-term effectiveness on groundwater quality since it prescribes “no action” to restore groundwater quality. GwA 2 acknowledges the presence of hazardous substances in the groundwater at both of the AOCs, and prohibits access to/use of it. Since an alternative potable water supply that does not rely on local groundwater exists within the PID Area, GwA 2 provides a remedy that should be effective for the long term and represent a permanent solution.

10.4 REDUCTION IN TOXICITY, MOBILITY, OR VOLUME THROUGH TREATMENT

SA 1 would provide no reduction in the toxicity, mobility or volume of hazardous substances found in soil at either of the AOCs. Under SA 2, soils containing hazardous substances in excess of the State’s Unrestricted Use SCOs will be excavated and transported off-site for disposal. This would reduce the toxicity and mobility of hazardous substances left at the AOCs. SAs #a1 (Leave Soil Stockpiled), 3a2 (Inter Stockpiled Soil) and 3b for SEAD-59 and SEAD-71 provide no reduction in the toxicity, mobility or volume of hazardous substances found in soil at either of the AOCs.

Comparably, neither GwA 1 nor GwA 2 would provide any reduction in the toxicity, mobility or volume of hazardous substances that are contained in groundwater at the AOCs.

10.5 SHORT-TERM EFFECTIVENESS

SA 1 would not pose any additional short-term hazards to workers at the AOCs or the community as construction is not included in the remedy proposed for either of the AOCs. SA 2 would pose some additional short-term hazards to neighboring site workers and the community through dermal contact, ingestion, or inhalation of contaminants during the excavation, loading, transporting, and unloading operations that are needed to complete the construction efforts. Further, noise from the heavy equipment used for excavation, loading, and hauling could also affect employees of neighboring industries and companies. In addition, interim and post remediation sampling activities would pose potential risks to field workers. Potential risks to nearby employees of local companies and site workers could be controlled by developing and implementing sound engineering controls, health and safety procedures, and monitoring practices.

Since soil will also be transported off-site under SA 2, there will be an increase in traffic on the roads within and surrounding the Depot and the receiving landfills. This would translate into an increased likelihood of vehicular accidents, and potential releases of soil and debris containing hazardous constituents at other locations along the driving routes. SA 2 also involves varying amounts of soil disturbance that could affect the surface water hydrology in the areas being excavated.

SA 2's disturbance of soil across larger surfaces at both AOCs also increases the likelihood of soil erosion and transport, both via surface water flow and as fugitive dusts. Therefore, appropriate silt and dust containment measures will be implemented and monitored during the excavation, loading, and hauling activities.

SA 3a1 (Leave Soil Stockpiled) poses no additional short-term hazards to neighboring site workers or the surrounding community.

SA 3a2 (SEAD-59) could pose some additional short-term hazards to neighboring site workers and the community through dermal contact, ingestion, or inhalation of contaminants due to the spreading of stockpiled soils during the construction efforts. Further, noise from the heavy equipment could also impact nearby employees of neighboring industries and companies. Potential risks to nearby employees of local companies and site workers could be controlled by developing and implementing sound engineering controls, health and safety procedures, and monitoring practices.

SA 3a2's disturbance of soil stockpiles and spreading of the soil and cover material also increases the likelihood of soil erosion and transport, both via surface water flow and as fugitive dusts. Therefore, appropriate silt and dust containment measures will be implemented and monitored during the spreading and covering activities.

SA 3b would not pose any additional short-term hazards to workers at the AOCs or the community as construction is not included in the remedy proposed for either of the AOCs.

Neither GwA 1 nor 2 are expected to cause any short-term effectiveness concerns, as neither require any physical action and there are no anticipated disturbances to the activities or operations performed within or around SEAD-59 or SEAD-71.

10.6 IMPLEMENTABILITY

SA 1, the "no action" alternative for both AOCs (SEAD-59 and SEAD-71), and SA 3a1 (Leave Soil Stockpiled / Land Use Controls for SEAD-59), would be the easiest alternative to implement, since none of them involve construction actions. SA 1 for both sites is administratively easiest because there are also no other actions necessary, while SA 3a1 requires the implementation, maintenance, and monitoring of LUCs for the soil matrix left at the AOCs.

SA 3a2 (SEAD-59 Inter Stockpiled Soils) will be slightly more difficult to implement than Alternative 1 because it requires the relocation of the SEAD-59 soil stockpiles and their interment under a protective cover at the SEAD. However, technologies required to complete this remedial action are mature and readily available, pose no inordinate obstacle to the completion of the action. Additionally, SAs 3a1, 3a2 and 3b all require implementation, maintenance, oversight, and annual reporting of the continuing effectiveness of LUCs and the preparation, submittal, and approval of a LUC implementation plan. This requirement does not pose any inordinate level of complexity, and should not prevent the implementation of these actions at the two AOCs.

SA 2 at both SEAD-59 and SEAD-71 will be the most difficult alternatives to implement because they requires the excavation and removal of varying levels of soil from the two AOCs, further characterization,

potential stabilization if hazardous waste characteristics are identified, transport to off-site Subtitle D Landfills, and subsequent disposal as cover material or fill. However, technologies required to complete this remedial action are mature and readily available, pose no inordinate obstacle to the completion of the action. Additionally, the both SA alternative (SEAD-59 and SEAD-71) require implementation, maintenance, oversight, and annual reporting of the continuing effectiveness of LUCs and the preparation, submittal, and approval of a LUC implementation plan. This requirement does not pose any inordinate level of complexity, and should not prevent the implementation of these actions at the two AOCs.

GwA 1, the “no action” alternative would be the easiest to implement since there are no actions to undertake. GwA 2 will only be slightly more difficult to implement because it only requires the implementation, maintenance, oversight, and annual reporting of the continuing effectiveness of the groundwater access/use restriction and the preparation, submittal and approval of the restriction implementation plan.

10.7 COST

The present worth cost associated with all alternatives is calculated using a discount rate of seven percent (7%) and a 30-year time interval. The estimated capital, operation, maintenance, and monitoring, and the present-worth costs are summarized below.

Alternative	Capital Cost (\$)	Annual OM&M Costs (\$/yr)	Total Present-Worth Costs (\$)
SEAD-59, the Fill Area West of Building 135			
GwA 1 & SA 1	\$0	\$0	\$0
GwA 2 & SA 1	\$0	\$3,000	\$37,230
GwA 1 & SA 2	\$2,182,800	\$0	\$2,182,800
GwA 2 & SA 2	\$2,182,800	\$3,000	\$2,220,030
GwA 1 & SA 3a1(Stockpile)	\$0	\$3,000	\$37,230
GwA 1 & SA 3a2 (Inter)	\$35,000	\$3,000	\$72,230
GwA 2 & SA 3a1(Stockpile)	\$0	\$6,000	\$74,460
GwA 2 & SA 3a2 (Inter)	\$35,000	\$6,000	\$109,460
SEAD-71, the Alleged Paint Disposal Area			
GwA 1 & SA 1	\$0	\$0	\$0
GwA 2 & SA 1	\$0	\$3,000	\$37,230
GwA 1 & SA 2	\$240,000	\$0	\$240,000
GwA 2 & SA 2	\$240,000	\$3,000	\$277,230
GwA 1 & SA 3b	\$0	\$3,000	\$37,230
GwA 2 & SA 3b	\$0	\$6,000	\$74,460

Alternative combination SA1 and GwA1 are the least expensive remedial alternatives at SEAD-59 and SEAD-71 with expected costs of \$0. Alternative combinations SA2 and GwA2 are the most expensive remedial action alternatives with respective costs of \$2,220,030 for SEAD-59 and \$277,230 for SEAD-71.

10.8 STATE ACCEPTANCE

NYSDEC concurs with the preferred remedial alternative.

10.9 COMMUNITY ACCEPTANCE

Appendix C “Public Comments and Responsiveness Summary,” addresses community involvement during the remedy selection process. No formal comments were received at the public meeting. During the public comment period, one letter, supportive of the preferred alternative, was received from a local resident and a copy of that letter is included in Appendix C of the ROD.

11.0 SELECTED REMEDY

Based upon consideration of the requirements of CERCLA, the detailed analysis of the alternatives and public comments, the Army and USEPA have selected Soil Alternative 3a1 and Groundwater Alternative 2 (SA 3a1 / GwA 2) for SEAD-59 and Soil Alternative 3b and Groundwater Alternative 2 (SA 3b / GwA 2) for SEAD-71. These alternative combinations best satisfy the requirements of CERCLA Section 121, 42 U.S.C. Section 9621, and provide the best balance of tradeoffs among the remedial alternatives with respect to the NCR's evaluation criteria, 40 CFR Section 300.430(e)(9). The selected groundwater alternative (GwA 2) requires the implementation, maintenance and monitoring of LUCs for groundwater at both AOCs. Soil Alternative 3a1 for SEAD-59 and Soil Alternative 3b for SEAD-71 require the implementation, monitoring and maintenance of LUCs for soil remaining at both AOCs. Specifically, the elements that comprise the selected remedies for SEAD-59 and SEAD-71 include:

- Establish, maintain, and monitor land use control (LUCs) at SEAD-59 and SEAD-71 that:
 - Prohibit access to or use of the groundwater until unrestricted use and unlimited exposure criteria are attained ; and,
 - Prohibit the development or use of the property for residential housing, elementary and secondary schools, childcare facilities and playgrounds until unrestricted use and unlimited exposure criteria are attained at SEAD-59 and SEAD-71.

In addition, once the land use restrictions are implemented at SEAD-59 and SEAD-71, the Army or its successor will be required to complete a review of the selected remedies at least one every five years, in accordance with Section 121(c) of the CERCLA.

Results of the site investigations and risk assessment performed using data developed from SEAD-59 and SEAD-71 indicate that hazardous substances have been identified to exist at, or in the vicinity of, the AOCs. Levels found are higher than NYS guidance values and above levels that allow for unrestricted use, and it is likely that the identified concentrations would prevent unlimited exposures to other non-commercial/industrial populations.

While, remaining concentrations of contaminants in the some of the soil at SEAD-59 and SEAD-71 exceed NYSDEC's Restricted Commercial and Industrial Use SCO level, the identified concentrations of hazardous substances found in the soil do not pose unacceptable levels of potential risk to the human receptors that are considered most likely to use the land (i.e., industrial worker, construction worker, adolescent trespasser) for the foreseeable future at SEAD-59 and SEAD-71. Further, while hazardous substances were identified in the groundwater at concentrations above NYS AWQSSs, an alternative potable water distribution supply exists throughout the PID Area, which minimizes the potential risks represented by contact or ingestion with this media.

The Army shall, through the on-site Commander's representative or other designated official, implement, inspect, report on, and enforce the remedy described in this ROD. This ROD selects as the remedy for SEAD-59 and SEAD-71 LUCs (i.e., groundwater access/use and land use limitations) to be imposed by an environmental easement at the time when land comprising SEAD-59 or SEAD-71 is transferred from Army ownership to another party, as well as the prohibition of any pre-transfer use inconsistent with the

LUCs. Although the Army may later transfer these responsibilities to another party, the Army shall retain ultimate responsibility for remedy integrity.

To implement the remedies selected in this Record of Decision, which will include the imposition of LUCs at SEAD-59 and SEAD-71, a LUC Remedial Design will be prepared which will provide for the recording of an environmental easement which is consistent with Paragraphs (a) and (c) of the New York State Environmental Conservation Law (ECL) Article 27, Section 1318: Institutional and Engineering Controls. In addition, the Army will prepare an environmental easement for SEAD-59 and SEAD-71, consistent with Section 27-1318(b) and Article 71, Title 36 of ECL, in favor of the State of New York, which will be recorded at the time of the property's transfer from Federal ownership and which will require the owner and/or any person responsible for implementing the LUCs set forth in this ROD to periodically certify that such institutional controls are in place. The Army and the USEPA will be named as third-party beneficiaries on the environmental easement. A schedule for completion of the draft SEAD-59 and SEAD-71 LUC Remedial Design Plan (LUC RD) will be completed within 21 days of the ROD signature, consistent with Section 14.4 of the Federal Facilities Agreement (FFA). To implement the remedy prior to transfer, the Army, as the owner and operator of the property at SEAD-59 and SEAD-71, will through the on site Commander's representative or other designated official, ensure that the LUCs are implemented by monitoring the property at SEAD 59 and SEAD 71 and restricting development or use on this property if inconsistent with the LUCs.

12.0 DOCUMENTATION OF SIGNIFICANT CHANGES

The Proposed Plan presented to the public for SEAD-59 during the comment period and public meeting in December 2007 and January 2008 indicated that soil found at SEAD-59, in the ground and staged in stockpiles, contained concentrations of hazardous substances that were at levels that exceeded New York State SCO (e.g., Restricted Commercial and Restricted Industrial) values. However, in spite of the presence of these concentrations of hazardous substances, a human health risk assessment indicated that future use by commercial and industrial type users was permissible, as no unacceptable human health effects or impacts were indicated.

Despite this finding and determination, the Proposed Plan presented to the public in December 2007 recommended a remedial action for SEAD-59 soils that indicated that stockpiled soil present at, and in the vicinity of, SEAD-59 would be spread out over a portion of the AOC, over covered with a layer of demarcation fabric and 12-inches of cover material that met NYS Restricted Commercial SCO levels. Further, once the multi-layered cover was installed, it would be graded to promote positive storm-event water flow, re-vegetated with native growth to limit potential erosion, and a LUC would be implemented, monitored, and maintained to prohibit unauthorized excavations or other activities that would disturb the soil cap or the demarcation fabric where stockpiled soils were interred. Finally, a LUC that prohibited use of SEAD-59 land for residential housing, elementary and secondary schools, childcare facilities, and playgrounds would also be implemented, monitored, and maintained at SEAD-59 until levels of hazardous substances present in the soil permitted unrestricted uses and unlimited exposures.

Since the SEAD-59 and SEAD-71 Proposed Plan was issued, the Army has identified another former SWMU in close proximity to SEAD-59 within the PID Area at the former Depot where residual levels of hazardous substances that remain in the soil pose a human health risk and require a remedial action. One of the potential actions being considered for this other SEAD (SEAD-5) is the construction of a multi-layered protective cap, consisting of soil and demarcation fabric, which would provide a barrier between the contaminated soils found at the AOC and future users of the site.

Stockpiled soil currently located at SEAD-59 could be used as a component of this multi-layered protective cap at the neighboring SWMU. Analytical results for samples of the stockpiled soil indicate that it is not a hazardous waste by characteristic, and that hazardous substance concentrations present in the soil do not pose unacceptable levels of risk to commercial or industrial future users. As such, the stockpiled soil could be used as a base course within the multi-layered cover, and provide additional separation between the underlying contaminated soils and the final soil cover material placed over the contaminated areas within the other SWMU. Another advantage of this reuse of stockpiled soil is that stockpile sites within SEAD-59 would be eliminated allowing for more possible commercial or industrial reuses of the land within SEAD-59. Further, by using the SEAD-59 stockpiled soils as a base course of the protective cap proposed at the other SWMU, the size of the land area where interred soils would be located would be reduced, and the amount of Restricted Commercial grade cover soil that was necessary to cover the underlying soils would be reduced.

Based on these determinations, the Army is pursuing the use of the stockpiled soils that remain at SEAD-59 as one component layer of the multi-layered cover at the neighboring SWMU, and is preparing a separate Proposed Plan and Record of Decision for that AOC (SEAD-5) that recommends such an action. Under the parallel plan and remedial action, the SEAD-59 soil would be used as a base layer overlying the more heavily contaminated underlying in-situ soils, and then the covered area would be over-covered with a layer of demarcation fabric, and 12-inches of soil that meets NYS Restricted Commercial Use SCO levels. The entire covered area would then be graded to promote positive storm-event runoff flow. A LUC that prohibits unauthorized excavation or activities that would disturb the multi-layered cover would then be implemented, monitored, and maintained at the neighboring SWMU. Finally, a second LUC that prohibits residential housing, elementary and secondary schools, childcare facilities, and playgrounds would also be implemented,

Once the stockpiles at SEAD-59 were removed and committed for use in this manner, the land at SEAD-59 would not require the implementation of a LUC that prohibited unauthorized excavations or activities that disturbed the soil and demarcation fabric cap placed over soils that might be interred within SEAD-59. However, the LUC that prohibited the use of the land at SEAD-59 for residential housing, elementary and secondary schools, childcare facilities and playgrounds would still be required at SEAD-59, as would the LUC that prohibited access to and use of groundwater.

13.0 STATE ROLE

The State of New York, through the New York State Department of Environmental Conservation (NYSDEC), has concurred with the selected remedies documented in this ROD. The NYSDEC Declaration of Concurrence is provided in **Appendix B** of this ROD.

Notes:

- Parameters that were detected in either surface or subsurface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discrete sample and presented in this table.
- NYSDEC Unrestricted Use Soil Cleanup Objective (SCO), Table 375-6.8(a), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.

Notes:

- Parameters that were detected in either surface or subsurface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discreet sample and presented in this table.
- NYSDEC Unrestricted Use Soil Cleanup Objective (SCO), Table 375-6.8(a), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.

Notes:									
1. Parameters that were detected in surface soil are presented in this table.									
2. 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, http://www.epa.gov/esd/tsc/download.htm									
3. Sample duplicate pairs were averaged into a discreet sample and presented in this table.									
4. NYSDEC Restricted Commercial Use Soil Cleanup Objective (SCO), Table 375-6.8(b), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.									
5. Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.									
6. Outlined and shaded cells represent the a 95th UCL value that exceeds the maximum detected concentration.

Notes:

- Parameters that were detected in either surface or subsurface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discreet sample and presented in this table.
- USEPA region IX PRG Industrial Soil Cleanup Objective (SCO), 2004
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.

Notes:									
1. Parameters that were detected in stockpile soil are presented in this table.									
2. 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, http://www.epa.gov/esd/tsc/download.htm									
3. Sample duplicate pairs were averaged into a discreet sample and presented in this table.									
4. NYSDEC Restricted Industrial Use Soil Cleanup Objective (SCO), Table 375-6.8(b), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.									
5. Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.

Notes:

- Parameters that were detected in either surface or subsurface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discreet sample and presented in this table.
- NYSDEC Unrestricted Use Soil Cleanup Objective (SCO), Table 375-6.8(a), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.

Notes:

- Parameters that were detected in either surface or subsurface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discreet sample and presented in this table.
- NYSDEC Restricted Commercial Use Soil Cleanup Objective (SCO), Table 375-6.8(b), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.

Notes:

- Parameters that were detected in either surface or subsurface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discreet sample and presented in this table.
- USEPA region IX PRG Industrial Soil Cleanup Objective (SCO), 2004
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.
- Outlined and shaded cells represent the a 95th UCL value that exceeds the maximum detected concentration.

- Sample duplicate pairs were averaged into a discreet sample and presented in this table.
- USEPA region IX PRG Industrial Soil Cleanup Objective (SCO), 2004
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.
- Outlined and shaded cells represent the a 95th UCL value that exceeds the maximum detected concentration.

Notes:
1. Parameters that were detected in surface soil are presented in this table.
2. 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
3. Sample duplicate pairs were averaged into a discrete sample and presented in this table.
4. NYSDEC Unrestricted Use Soil Cleanup Objective (SCO), Table 375-6.8(a), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.
5. Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.
6. Outlined and shaded cells represent the a 95th UCL value that exceeds the maximum detected concentration.

Notes:

- Parameters that were detected in surface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discrete sample and presented in this table.
- NYSDEC Restricted Commercial Use Soil Cleanup Objective (SCO), Table 375-6.8(b), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.
- Outlined and shaded cells represent the a 95th UCL value that exceeds the maximum detected concentration.

Notes:

- Parameters that were detected in surface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discrete sample and presented in this table.
- NYSDEC Restricted Industrial Use Soil Cleanup Objective (SCO), Table 375-6.8(b), under Subpart 375-6: Remedial Program Soil Cleanup Objectives.
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.
- Outlined and shaded cells represent the a 95th UCL value that exceeds the maximum detected concentration.

Notes:

- Parameters that were detected in surface soil are presented in this table.
- 95th Upper Confidence Limit was calculated from USEPA program, ProUCL Ver 4, <http://www.epa.gov/esd/tsc/download.htm>
- Sample duplicate pairs were averaged into a discrete sample and presented in this table.
- USEPA region IX PRG Industrial Soil Cleanup Objective (SCO), 2004
- Bold and shaded cells represent 95th UCL values that were replaced with the maximum detected concentration.
- Outlined and shaded cells represent the a 95th UCL value that exceeds the maximum detected concentration.

APPENDIX B

LETTER OF CONCURRENCE

APPENDIX C

PUBLIC COMMENT AND RESPONSIVENESS SUMMARY

PUBLIC COMMENTS AND RESPONSIVENESS SUMMARY**The FILL AREA WEST OF BUILDING 135 (SEAD-59) AND THE ALLEGED PAINT
DISPOSAL AREA (SEAD-59)****SENECA ARMY DEPOT SUPERFUND SITE****INTRODUCTION**

A responsiveness summary is required by Superfund policy. It provides a summary of citizen's comments and concerns received during the public comment period, and the Army's responses to those comments and concerns.

OVERVIEW

Since the inception of this project, the Army has implemented an active policy of involvement with the local community. This involvement has occurred through the public forum provided by regular meetings of the Base Clean-up Team (BCT). During these meetings, representatives of the community, the Army and the regulators are brought together in a forum where ideas and concerns are voiced and addressed. The BCT has been routinely briefed by the Army in regards to the progress and the results obtained during both the investigation and remedial alternative selection process. In addition to regular project specific briefings, the Army has provided experts in various fields related to the CERCLA program that have provided lectures intended to educate the general public in the various technical aspects of the CERCLA program at SEDA. Lectures have been conducted on risk assessments, both human health and ecological, remedial alternatives, such as bioventing and natural attenuation, institutional controls, and the feasibility study process.

BACKGROUND ON COMMUNITY INVOLVEMENT

Initially, during the years from 1991 through 1995 the Army formed and solicited community involvement through quarterly meetings with the Technical Review Committee (TRC). The TRC was comprised of community leaders with an active interest in the on-goings of the CERCLA process at the depot. These meetings were open to the public and were announced in the local newspaper and the radio. Following inclusion of the depot on the final BRAC closure list in late 1995, the Army transitioned from the TRC and formed the Base Clean-up Team (BCT). The BCT was comprised of several of the TRC members with the addition of additional Army and regulatory representatives. The BCT increased the frequency of the meetings to a monthly basis. Since the formation of the TRC and the BCT, the Army has met with the local community members on a regular basis and has discussed the finding of both the RI and the FS. In addition, the proposed plan has been presented to the BCT.

SUMMARY OF COMMUNITY RELATIONS ACTIVITIES

The RI reports, the Completion Report for the Time-Critical Removal Action and the Proposed Plan for SEAD-59 and SEAD-71 were released to the public for comment. These documents were made available to the public in the administrative record file at the information repositories at Building 123 within the Seneca Army Depot Activity, 5786 State Route 96, Romulus, New York, 14541-0009. The public comment period on these documents was held from December 10, 2007 to January 8, 2008. The notice of availability for the above-referenced documents was published in the Finger Lake Times during this time period.

On December 19, 2007, the Army, the USEPA and the NYSDEC conducted a public meeting at the Seneca County Board of Supervisors Room, located at the Seneca County Office Building in Waterloo, NY to inform local officials and interested citizens about the Superfund process, to review current and planned remedial activities at the AOCs, and to respond to any questions from area residents and other attendees. The meeting included poster board presentations and provided an opportunity for the public to speak to Army, USEPA and NYSDEC representatives involved in the process. The public was given the opportunity to provide formal comments that would be documented and become part of the official record for the selected remedy.

SUMMARY OF COMMENTS AND RESPONSES

No formal comments were received from the community during the public meeting. There is no official transcript since no comments were provided. There was one letter received from the public during the public comment period, which is provided on the following page. The Army's response to this letter is also provided.

Mr. Stephen M. Absolom
BRAC Environmental Coordinator
Seneca Army Depot Activity
Building 123, P.O. Box 9
5786 State Route 96
Romulus, New York 14541-0009

January 4, 2008

Dear Mr. Absolom,

This letter serves as comments on the Proposed Plan – Draft Final for the Fill Area West of Building 135 (SEAD-59) and the Alleged Paint Disposal Area (SEAD-71).

The proposed alternatives demonstrate the outstanding leadership that the U.S. Army Corps of Engineers and Parson's Engineering have displayed in regards to their long-standing working relationship in regards to environmental remediation at Seneca Army Depot Activity. Both the Corps of Engineers and Parson's Engineering have done a commendable job in making the Depot available for future uses.

I thank you for the ability to comment on the Proposed Plan.

Regards,

Thomas J. Klotzbach
1204 Waterport Road
Waterport, New York 14571

Response:

The U.S. Army Corps of Engineers, Seneca Army Depot, acknowledges receipt of Mr. Klotzbach's letter, dated January 4, 2008. We wish to express our thanks for his comments in appreciation of the efforts undertaken at SEAD-59 and SEAD-71.

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
J = the reported value is an estimated concentration
UJ = the compound was not detected; the associated reporting limit is approximate
R = the data was rejected in the data validating process
NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
J = the reported value is an estimated concentration
UJ = the compound was not detected; the associated reporting limit is approximate
R = the data was rejected in the data validating process
NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
J = the reported value is an estimated concentration
UJ = the compound was not detected; the associated reporting limit is approximate
R = the data was rejected in the data validating process
NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)

(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Parameter	Units	Value (Q)	Value (Q)	Value (Q)	Value (Q)	Value (Q)
------------------	--------------	------------------	------------------	------------------	------------------	------------------

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
 J = the reported value is an estimated concentration
 UJ = the compound was not detected; the associated reporting limit is approximate
 R = the data was rejected in the data validating process
 NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):
(1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
(2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected
J = the reported value is an estimated concentration
UJ = the compound was not detected; the associated reporting limit is approximate
R = the data was rejected in the data validating process
NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

- (1) - Historical sample depths are presented (i.e. prior to 2002 TCRA)
- (2) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

Note(s):

(1) - Sample/Duplicate pair are presented as individual samples in this table. Statistical information used Sample Duplicate pairs as a single entity and averaged result values were used in risk assessment analysis.

U = compound was not detected

J = the reported value is an estimated concentration

UJ = the compound was not detected; the associated reporting limit is approximate

R = the data was rejected in the data validating process

NJ = compound was "tentatively identified" and the associated numerical value is approximate

APPENDIX E

RISK ASSESSMENT DATA AND RESULTS

Appendix E

Human Health Risk Assessment Uncertainty Analysis Risk Calculation Tables

- 1A Occurrence, Distribution, and Selection of Chemicals of Potential Concern in SEAD-59 Soil
- 1B Occurrence, Distribution, and Selection of Chemicals of Potential Concern in SEAD-59 Groundwater
- 1C Occurrence, Distribution, and Selection of Chemicals of Potential Concern in SEAD-59 Stockpile Soil
- 1D Occurrence, Distribution, and Selection of Chemicals of Potential Concern in SEAD-71 Soil (Fenced Area Excluded)
- 1E Occurrence, Distribution, and Selection of Chemicals of Potential Concern in SEAD-71 Groundwater (Fenced Area Excluded)
- 2A SEAD-59 Surface Soil – Soil Exposure Point Concentration Summary
- 2B SEAD-59 Surface and Subsurface Soil – Soil Exposure Point Concentration Summary
- 2C SEAD-59 Surface Soil – Ambient Air Exposure Point Concentrations
- 2D SEAD-59 Surface and Subsurface Soil – Ambient Air Exposure Point Concentrations
- 2E SEAD-59 Groundwater Exposure Point Concentration Summary
- 2F SEAD-59 Stockpile Soil – Soil Exposure Point Concentration Summary
- 2G SEAD-59 Stockpile Soil – Ambient Air Exposure Point Concentrations
- 2H SEAD-71 Surface Soil (Fenced Area Excluded) – Soil Exposure Point Concentration Summary
- 2I SEAD-71 Surface and Subsurface Soil (Fenced Area Excluded) – Soil Exposure Point Concentration Summary
- 2J SEAD-71 Surface Soil (Fenced Area Excluded) – Ambient Air Exposure Point Concentrations
- 2K SEAD-71 Surface and Subsurface Soil (Fenced Area Excluded) – Ambient Air Exposure Point Concentrations
- 2L SEAD-71 Groundwater Exposure Point Concentration Summary
- 3 Exposure Factor Assumptions for Adolescent Trespasser

Appendix E (Continued)

- 4A Non-Cancer Toxicity Data – Oral/Dermal
- 4B Non-Cancer Toxicity Data – Inhalation
- 4C Cancer Toxicity Data – Oral/Dermal
- 4D Cancer Toxicity Data – Inhalation
- 5A Calculation of Intake and Risk from the Ingestion of SEAD-59 Soil – RME
- 5B Calculation of Intake and Risk from the Ingestion of SEAD-59 Stockpile Soil – RME
- 5C Calculation of Intake and Risk from the Ingestion of SEAD-71 Soil (Fenced Area Excluded) – RME
- 6A Calculation of Absorbed Dose and Risk from Dermal Contact to SEAD-59 Soil – RME
- 6B Calculation of Absorbed Dose and Risk from Dermal Contact to SEAD-59 Stockpile Soil – RME
- 6C Calculation of Absorbed Dose and Risk from Dermal Contact to SEAD-71 Soil (Fenced Area Excluded) – RME
- 7A Calculation of intake and Risk from Inhalation of SEAD-59 Dust in Ambient Air – RME
- 7B Calculation of intake and Risk from Inhalation of SEAD-59 Stockpile Dust in Ambient Air – RME
- 7C Calculation of intake and Risk from Inhalation of SEAD-71 Dust in Ambient Air (Fenced Area Excluded) – RME
- 8A Calculation of Absorbed Dose and Risk from Dermal Contact to SEAD-59 Groundwater – RME
- 8B Calculation of Absorbed Dose and Risk from Dermal Contact to SEAD-71 Groundwater – RME
- 9A Calculation of Intake and Risk from the Intake of SEAD-59 Groundwater – RME
- 9B Calculation of Intake and Risk from the Intake of SEAD-71 Groundwater – RME
- 10 Calculation of Blood Level Concentration – Industrial Worker Exposed to SEAD-59 Stockpile Soil
- 11 Calculation of Blood Level Concentration – Construction Worker Exposed to SEAD-59 Stockpile Soil
- 12 Calculation of Blood Lead Level Concentration – Child Exposed to SEAD-59 Stockpile Soil

Appendix E (Continued)

- 13 Calculation of Blood Level Concentration – Industrial Construction Worker Exposed to SEAD-71 Surface Soil
- 14 Calculation of Blood Level Concentration – Construction Worker Exposed to SEAD-71 Surface and Subsurface Soil
- 15 Calculation of Blood Lead Level Concentration – Child Exposed to SEAD-71 Soil and Groundwater

Notes:

- Field duplicates were treated as discrete samples. Laboratory duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
- The maximum detected concentration was used for screening.
- Background value is the maximum Seneca background concentration.
- EPA Region 9 Preliminary Remediation Goals (PRGs) for residential soil. On-line resources available at <http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls>. Last updated October 2004.
Region 9 PRGs were derived based on Direct contact exposure (ingestion and dermal contact) and a target Cancer Risk of 1E-6 or a Target Hazard Quotient of 1.
EPA Region III Risk Based Concentration (RBC) for residential soil was used as screening value for 2-methylnaphthalene as no Region 9 PRG is available. EPA Region III RBC, available on-line at <http://www.epa.gov/reg3hwmd/risk/human/rbc/rbc1004.XLS>, was calculated based on soil ingestion exposure and a target cancer risk of 1E-6 and a target hazard quotient of 1.
The PRGs or RBCs corresponding to a hazard quotient of 1 were adjusted by multiplying 0.1 before they were used as screening values.
PRG for xylenes was used as screening value for meta/para xylenes and ortho xylene.
PRG for Aroclor 1254 was used as screening value for Aroclor 1260.
PRG for gamma-chlordane was used as screening value for alpha-chlordane.
PRG for alpha-BHC was used as screening value for delta-BHC.
PRG for endosulfan was used as screening value for endosulfan I, endosulfan II, and endosulfan sulfate.
PRG for endrin was used as screening value for endrin aldehyde and endrin ketone.
Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 200 mg/day soil ingestion and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium) from Marilyn Wright (2001) Dietary Reference Intakes.
PRG for total chromium (1:6 ratio Cr VI: Cr III) was used as screening value for chromium.
PRG for nickel (soluble salts) was used as screening value for nickel.
- Potential ARAR/TBC values are from NYSDEC Technical and Administrative Guidance Memorandum #4046 (on-line resources available at <http://www.dec.state.ny.us/website/der/tagms/prtg4046.html>)
- Rationale codes
Selection Reason: Above Screening Levels (ASL)
Chemicals in the Same Group were retained as COPC (CSG)
Deletion Reason: Essential Nutrient (NUT)
Below Screening Level (BSL)
No Screening Value or Toxicity Value (NSV)

Individual Chemicals Evaluated (ICE)

Definitions:

COPC = Chemical of Potential Concern

ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered

Q = Qualifier

J = Estimated Value

NJ = Presence of the analyte has been "tentatively identified" and the associated numerical value represents its approximate concentration.

**APPENDIX E TABLE 1B
 OCCURRENCE, DISTRIBUTION AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN IN SEAD-59 SITE GROUNDWATER
 SEAD-59 AND SEAD-71 PHASE II RI
 SENECA ARMY DEPOT ACTIVITY**

Notes:

1. Field duplicates were averaged and regarded as one sample entry. Laboratory duplicates were not included in the assessment.
 Range of reporting limits were presented for nondetects only.
2. The maximum detected concentration was used for screening.
3. Background values are average concentrations of background sample results.
4. EPA Region 9 Preliminary Remediation Goals (PRGs) for tap water. On-line resources available at <http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls>. Last updated October 2004.
 Region 9 PRGs were derived based on ingestion and inhalation exposure and a target Cancer Risk of 1E-6 or a Target Hazard Quotient of 1.
 The PRGs corresponding to a hazard quotient of 1 was adjusted by multiplying 0.1 before they were used as screening values.
 MCL for lead was used as screening value for lead as no Region 9 PRG is available.
 PRG for endrin was used as screening value for endrin ketone.
 Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 2L/day water intake and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 2-5 yr children (1400 mg/day for potassium) from Marilyn Wright (2001) Dietary Reference Intakes.
 For sodium, an upper limit intake of 2,400 mg/day (<http://www.mealformation.com/dailyval.html>) was used
 PRG for chromium (VI) was used as screening value for chromium.
5. Rationale codes

Selection Reason:	Above Screening Levels (ASL)
Deletion Reason:	Essential Nutrient (NUT)
	Below Screening Level (BSL)

Definitions:

COPC = Chemical of Potential Concern
 ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
 MCL = Federal Maximum Contaminant Level
 GA = New York State Class GA Groundwater Standard (TOGS 1.1.1, June 1998 with updates)
 SEC = USEPA Secondary Drinking Water Regulation, non-enforceable (EPA 822-B-00-001, Summer 2000)
 Q = Qualifier
 J = Estimated Value

Notes:

- Field duplicates were averaged and regarded as one sample entry. Laboratory duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
- The maximum detected concentration was used for screening.
- Background value is the maximum Seneca background concentration.
- EPA Region 9 Preliminary Remediation Goals (PRGs) for residential soil. On-line resources available at <http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls>. Last updated October 2004. Region 9 PRGs were derived based on Direct contact exposure (ingestion and dermal contact) and a target Cancer Risk of 1E-6 or a Target Hazard Quotient of 1. EPA Region III Risk Based Concentration (RBC) for residential soil was used as screening value for 2-methylnaphthalene as no Region 9 PRG is available. EPA Region III RBC, available on-line at <http://www.epa.gov/reg3hwmd/risk/human/rbc/rbc1004.XLS>, was calculated based on soil ingestion exposure and a target cancer risk of 1E-6 and a target hazard quotient of 1. The PRGs or RBCs corresponding to a hazard quotient of 1 were adjusted by multiplying 0.1 before they were used as screening values. PRG for gamma-chlordane was used as screening value for alpha-chlordane. PRG for endrin was used as screening value for endrin ketone. Screening values for calcium, magnesium, potassium, and sodium were calculated based on 200 mg/day soil ingestion and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium) from Marilyn Wright (2001) Dietary Reference Intakes. PRG for total chromium (1:6 ratio Cr VI: Cr III) was used as screening value for chromium. PRG for nickel (soluble salts) was used as screening value for nickel.
- Potential ARAR/TBC values are from NYSDEC Technical and Administrative Guidance Memorandum #4046 (on-line resources available at <http://www.dec.state.ny.us/website/der/tagms/prtg4046.html>)
- Rationale codes

Selection Reason:	Above Screening Levels (ASL)
	Chemicals in the Same Group were retained as COPC (CSG)
Deletion Reason:	Essential Nutrient (NUT)
	Below Screening Level (BSL)
	No Screening Value or Toxicity Value (NSV)

Definitions:

- COPC = Chemical of Potential Concern
 ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
 Q = Qualifier
 J = Estimated Value
 NJ = Presence of the analyte has been "tentatively identified" and the associated numerical value represents its approximate concentration.

Notes:

- Field duplicates were averaged and regarded as one sample entry. Laboratory duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
- The maximum detected concentration was used for screening.
- Background value is the maximum Seneca background concentration.
- EPA Region 9 Preliminary Remediation Goals (PRGs) for residential soil. On-line resources available at <http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls>. Last updated October 2004. Region 9 PRGs were derived based on Direct contact exposure (ingestion and dermal contact) and a target Cancer Risk of 1E-6 or a Target Hazard Quotient of 1. EPA Region III Risk Based Concentration (RBC) for residential soil was used as screening value for 2-methylnaphthalene as no Region 9 PRG is available. EPA Region III RBC, available on-line at <http://www.epa.gov/reg3hwmd/risk/human/rbc/rbc1004.XLS>, was calculated based on soil ingestion exposure and a target cancer risk of 1E-6 and a target hazard quotient of 1. The PRGs or RBCs corresponding to a hazard quotient of 1 were adjusted by multiplying 0.1 before they were used as screening values. PRG for Aroclor 1254 was used as screening value for Aroclor 1260. PRG for gamma-chlordane was used as screening value for alpha-chlordane. PRG for alpha-BHC was used as screening value for delta-BHC. PRG for endosulfan was used as screening value for endosulfan I, endosulfan II, and endosulfan sulfate. PRG for endrin was used as screening value for endrin aldehyde and endrin ketone. Screening values for calcium, magnesium, potassium, and sodium were calculated based on 200 mg/day soil ingestion and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 1 yr children (225 mg/day and 1000 mg/day for sodium and potassium) from Marilyn Wright (2001) Dietary Reference Intakes. PRG for total chromium (1:6 ratio Cr VI: Cr III) was used as screening value for chromium. PRG for nickel (soluble salts) was used as screening value for nickel.

Notes:

- Field duplicates were averaged and regarded as one sample entry. Laboratory duplicates were not included in the assessment. Range of reporting limits were presented for nondetects only.
- The maximum detected concentration was used for screening.
- Background values are average concentrations of background sample results.
- EPA Region 9 Preliminary Remediation Goals (PRGs) for tap water. On-line resources available at <http://www.epa.gov/region09/waste/sfund/prg/files/prgtable2004.xls>. Last updated October 2004.
 Region 9 PRGs were derived based on ingestion and inhalation exposure and a target Cancer Risk of 1E-6 or a Target Hazard Quotient of 1. The PRGs corresponding to a hazard quotient of 1 was adjusted by multiplying 0.1 before they were used as screening values.
 MCL for lead was used as screening value for lead as no Region 9 PRG is available.
 PRG for endrin was used as screening value for endrin ketone.
 Screening values for calcium, magnesium, potassium, and sodium were calculated based on an assumption of 2L/day water intake and recommended dietary allowances and adequate intakes for 1-3 yr children (500 mg/day and 80 mg/day for calcium and magnesium) and minimum requirements for 2-5 yr children (1400 mg/day for potassium) from Marilyn Wright (2001) Dietary Reference Intakes.
 For sodium, an upper limit intake of 2,400 mg/day (<http://www.mealformation.com/dailyval.html>) was used.
 PRG for chromium (VI) was used as screening value for chromium.
- Rationale codes
 Selection Reason: Above Screening Levels (ASL)
 Deletion Reason: Essential Nutrient (NUT)
 Below Screening Level (BSL)

Definitions:

COPC = Chemical of Potential Concern
 ARAR/TBC = Applicable or Relevant and Appropriate Requirement/To Be Considered
 MCL = Federal Maximum Contaminant Level
 GA = New York State Class GA Groundwater Standard (TOGS 1.1.1, June 1998 with updates)
 SEC = USEPA Secondary Drinking Water Regulation, non-enforceable (EPA 822-B-00-001, Summer 2000)
 Q = Qualifier

Vanadium	mg/L	0.0021	0.00526	J	0.00526	MDC	See note	0.00526	MDC	See note

Notes:

- Field duplicates were averaged and regarded as one sample entry. Lab duplicates were not included in the assessment.
Concentrations for nondetects were assumed to be half the detection limits.
 - The maximum detected concentration was used as EPC for the RME scenario.
As residential use of groundwater has been based on the assumption that a single private well can be placed anywhere in the contaminated plume, the MDC across several rounds of monitoring was used as the EPC for groundwater as a conservative step for both the RME and CT scenarios.
 - The maximum detected concentration was used as EPC for the CT scenario.
- EPC = Exposure Point Concentration
MDC = Maximum Detected Concentration
RME = Reasonable Maximum Exposure
CT = Central Tendency

Vanadium	ug/L	4.71	25.7	J	ug/L	25.7	MDC	See note	25.7	MDC	See note

Notes:

- Field duplicates were averaged and regarded as one sample entry. Lab duplicates were not included in the assessment. Concentrations for nondetects were assumed to be half the detection limits.
 - The maximum detected concentration was used as EPC for the RME scenario.
As residential use of groundwater has been based on the assumption that a single private well can be placed anywhere in the contaminated plume, the MDC across several rounds of monitoring was used as the EPC for groundwater as a conservative step for both the RME and CT scenarios.
 - The maximum detected concentration was used as EPC for the CT scenario.
- EPC = Exposure Point Concentration
MDC = Maximum Detected Concentration
RME = Reasonable Maximum Exposure
CT = Central Tendency

**APPENDIX E TABLE 3
EXPOSURE FACTOR ASSUMPTIONS FOR SEAD-59 AND SEAD-71
SEAD-59 AND SEAD-71 PHASE II RI
Seneca Army Depot Activity**

Scenario Timeframe:	Current/Future
Medium:	Soil
Exposure Medium:	Soil
Exposure Point:	SEAD-59 and SEAD-71
Receptor Population:	Adolescent Trespasser / Adolescent Visitor
Receptor Age:	Adolescent (11-16 yr)

EXPOSURE ROUTE	PARAMETER CODE	PARAMETER DEFINITION	UNITS	RME VALUE	RME RATIONALE	RME REFERENCE
Ingestion of Soil	EPC	Soil EPC	mg/kg		Surface soils.	See Table 6-4A/B/C & 6-5A/B
	BW	Body Weight	kg	50	Average weight for adolescent ages 11-16 (Table 7-3).	USEPA, 2002.

N/A = Not Applicable

NCEA = National Center for Environmental Assessment

IRIS = Integrated Risk Information System

PPRTV = EPA's Provisional Peer Reviewed Toxicity Values

(1) Source: Supplemental Guidance for Dermal Risk Assessment. Part E of Risk Assessment Guidance for Superfund, Human Health Evaluation Manual (Volume I). Final. USEPA. 2004.

A default value of 1 was used if no value was available in the USEPA (2004) document.

(2) Dermal RfD = Oral RfD x Adjustment Factor

(3) For IRIS values, the date was the last time IRIS was checked.

For NCEA values, the date was the date of the article provided by NCEA.

For PPRTV values, the date was the date of the Region III RBC table, where the PPRTV was cited from.

(4) The chronic oral RfD for manganese was adjusted by using a modifying factor of 3 in accordance with the IRIS recommendation.

In addition, dietary exposure (assumed 5 mg/day) was subtracted. Thus, the RfD used in this risk assessment is 1/6 of the value listed in the IRIS.

(5) The chronic oral RfD for thallium was based on the chronic oral RfD of thallium sulfate adjusted for molecular weight differences.

IRIS = Integrated Risk Information System

HEAST= Health Effects Assessment Summary Tables

NCEA = National Center for Environmental Assessment

Notes:

(1) The adjustment was based on a 70 kg body weight and 20 m³/day inhalation rate.

(2) For IRIS values, the date was the last time IRIS was checked. For NCEA values, the date was the date of the Region III RBC, where the NCEA was cited from.

EPA Group:

A - Human carcinogen

B1 - Probable human carcinogen - indicates that limited human data are available

B2 - Probable human carcinogen - indicates sufficient evidence in animals and inadequate or no evidence in humans

C - Possible human carcinogen

D - Not classifiable as a human carcinogen

E - Evidence of noncarcinogenicity

APPENDIX F

LIST OF ARARs

APPENDIX F

LIST OF ARARs

There are currently no promulgated Federal standards for hazardous substance levels in soils, and risk-based decisions are used to determine if cleanup is warranted or necessary. New York has recently published Remedial Program Requirements, which include numeric soil cleanup objectives for five categories of future land use (i.e., Unrestricted, Residential, Restricted-Residential, Commercial, and Industrial), as well as procedures for proposing alternative cleanup objectives, for waste sites located within its bounds and these were considered during the development of this Record of Decision to represent “to be considered” (TBC) values and procedures.

New York designates all groundwater as a possible source of drinking water. Further, New York has promulgated standards for groundwater that is designated as GA. The groundwater at SEDA is designated as GA, and thus New York’s groundwater standards are ARARs. Groundwater was sampled at SEAD-59 and SEAD-71 and the available analytical data indicates that there are some contaminants present in the samples that are found at concentrations above State GA standards.

The noted groundwater exceedances found at SEAD-59 and SEAD-71 are not associated with the historic activities conducted at the AOCs. The observed contaminants are associated with the native soils of the depot, and the poor regional groundwater quality that exists throughout the PID Area. The overburden is comprised principally of a clay-silt mixture that results in a very low yielding groundwater flow system. The groundwater is susceptible to entrainment of soil fines and particles.

The potential use of groundwater that is classified as GA in New York is as drinking water. As a potential supply of drinking water, the maximum contaminant levels (MCLs) established under the Safe Drinking Water Act are ARARs for GA groundwater. Exceedances of the MCLs were observed in groundwater samples collected from SEAD-59 and SEAD-71. The shallow aquifer that underlies the PID Area and the a majority of the overall Depot is subject to large seasonal elevation variations and is poor yielding due to the low permeability glacial till, clay and silt formation that defines the shallow overburden. The PID Area of SEDA is serviced by a municipal water supply that derives its raw water from a non-groundwater source, which makes the future use of the poor yielding, shallow groundwater aquifer that underlies portions of the PID Area unnecessary. Finally, the generally poor quality of the PID Area-wide groundwater has already been identified and acknowledged, and access to and use of the groundwater in the greater PID Area, exclusive of Army retained properties, has been restricted in a separate ROD that was finalized in 2004 [Final ROD for Sites Requiring Institutional Controls in the Planned Industrial/Office Development or Warehousing Areas (Parsons, 2004).

Surface water at SEAD-59 and SEAD-71 is found occasionally in man-made drainage ditches that abut the AOCs along their sides and along bisecting roadways, and in localized puddles that evaporate into the air or infiltrate into the soil. . Storm-event water falls on both of the AOCs and then runs off towards the abutting drainage ditches. The surface water captured in the drainage ditches has not been classified by NYSDEC since these ditches are not recognized as an established stream or creek. However, because the

drainage ditches form the headwaters for Kendaia Creek, the lower portion of which is designated as Class C surface water by NYSDEC, the Class C surface water ambient water quality criteria were used to provide a basis of comparison for the on-site chemical data. The Class C standards are not strictly applicable to the surface water in the drainage ditches found on the sites and thus are treated as TBCs.

The sediment found in the drainage ditches at SEDA results from overland flow and the erosion and subsequent accumulation native soil, debris and dead vegetation. The man-made drainage ditches located throughout the Depot were subject to a periodic inspection and maintenance (i.e., dredging) program during the active days of the military operation. Drainage ditches found around both of these AOCs are generally void of fish and aquatic animal life. As such, sediment at both of these AOCs has been evaluated as “ditch soil” and compared to the New York State soil cleanup objectives presented in Title 6 NYCRR Subpart 375-6.

Chemical-Specific ARARs, and other pertinent advisories or guidance to be considered (TBCs)

Soil

Title 6 New York Code of Rules and Regulations Part 375-6 Remedial Program Soil Cleanup Objectives, Soil Cleanup Objectives, June 14, 2006 was considered during the development of this Record of Decision.

U.S. EPA Region IX Preliminary Remedial Goals, October 2004 was considered during the development of this Record of Decision. Source (<http://www.epa.gov/region09/waste/sfund/prg/>)

U.S. EPA Region III Risk Based Concentrations, October 2007 was considered during the development of this Record of Decision. Source: <http://www.epa.gov/reg3hwmd/risk/human/rbc/RBCoct07.pdf>

Groundwater

Title 40 Code of Federal Regulations, Part 141 – National Primary Drinking Water Regulations.

Title 6 New York Code of Rules and Regulations Part 703 Surface Water and Groundwater Quality Standards and Groundwater Effluent Limitations.

Title 6 New York Code of Rules and Regulations Part 375-6 Remedial Program Soil Cleanup Objectives, Protection of Groundwater, June 14, 2006 was considered during the development of this Record of Decision.

Surface Water:

Title 6 New York Code of Rules and Regulations Part 703 Surface Water and Groundwater Quality Standards and Groundwater Effluent Limitations was considered during the development of this Record of Decision.

Federal Location-Specific ARARs

- Executive Orders 11593, Floodplain Management (May 24, 1977), and 11990, Protection of Wetlands (May 24, 1977).
- National Historic Preservation Act (16 USC 470) Section 106 and 110(f), and the associated regulations (i.e., 36 CFR part 800) (requires Federal agencies to identify all affected properties on or

eligible for the National Register of Historic Places and consult with the State Historic Preservation Office and Advisory Council on Historic Presentation).

- RCRA Location and 100-year Floodplains Requirements (40 CFR 264.18(b)).
- Clean Water Act, section 404, and Rivers and Harbor Act, section 10 (requirements for dredge and fill activities) and the associated regulations (*i.e.*, 40 CFR part 230).
- Wetlands Construction and Management Procedures (40 CFR part 6, Appendix A).
- Endangered Species Act of 1973 (16 USC 1531 - 1544).
- Fish and Wildlife Coordination Act of 1934 (16 USC 661).
- Wilderness Act of 1964 (16 USC 1131 - 1136).

New York Location-Specific ARARs

- New York State Freshwater Wetlands Law (New York Environmental Conservation Law (ECL) articles 24 and 71).
- New York State Freshwater Wetlands Permit and Classification Requirements (6 NYCRR 663 and 664).
- New York State Floodplain Management Act, ECL, article 36, and Floodplain Management regulations (6 NYCRR Part 500).
- Endangered and Threatened Species of Fish and Wildlife, Species of Special Concern Requirements (6 NYCRR part 182).
- New York State Inactive Hazardous Waste Disposal Sites—Remedy Selection (6 NYCRR 375.10(b) (“goal of the program for a specific site is to restore that site to pre-disposal conditions, to the extent feasible and authorized by law.”)).
- New York State Flood Hazard Area Construction Standards.

Federal Action-Specific ARARs

- RCRA subtitle C, Hazardous Waste Treatment Facility Design and Operating Standards for Treatment and Disposal systems, (*i.e.*, landfill, incinerators, tanks, containers, etc.) (*i.e.*, 40 CFR part 264); RCRA section 3004(o), 42 USC 6924(o) (RCRA statutory minimum technology requirements.)
- RCRA, Closure and Post-Closure Standards (40 CFR 264, subpart G).
- RCRA Groundwater Monitoring and Protection Standards (40 CFR 264.92 and 264.97 – 264.99).
- RCRA Generator Requirements for Manifesting Waste for Off-site Disposal (40 CFR part 262, subpart B).
- RCRA Transporter Requirements for Off-Site Disposal (40 CFR part 263).
- RCRA, Subtitle D, Non-Hazardous Waste Management Standards (40 CFR part 257).
- RCRA Land Disposal Restrictions (40 CFR part 268) (on and off-site disposal of excavated soil).
- CWA--NPDES Permitting Requirements for Discharge of Treatment System Effluent (40 CFR parts 122-125).
- CWA--Effluent Guidelines for Organic Chemicals, Plastics and Synthetic Fibers (discharge limits) (40 CFR part 414).
- CWA--Discharge to POTW—general Pretreatment regulations (40 CFR part 403).

- DOT Rules for Hazardous Materials Transport (49 CFR part 107, and 171.1-171.500).
- OSHA Standards for Hazardous Waste Operations and Emergency Response, 29 CFR 1910.120, and procedures for General Construction Activities (29 CFR parts 1910 and 1926).
- RCRA Air Emission Standards for Process Vents, Equipment Leaks, and Tanks, Surface Impoundments, and Containers (40 CFR part 264, subparts AA, BB, and CC).

New York Action-Specific ARARs

- New York State Pollution Discharge Elimination System (SPDES) Permit Requirements (Standards for Stormwater Runoff, Surface Water, and Groundwater Discharges (6 NYCRR 750-757)).
- New York State Hazardous Waste Regulations—identification, generators, transportation, treatment/storage/disposal, land disposal restrictions, and minimum technology requirements (6 NYCRR 370-376)
- New York State Solid Waste Management and Siting Restrictions (6 NYCRR 360-361).
- New York State Hazardous Waste Generator and Transporter Requirements for Manifesting Waste for Off-Site Disposal (6 NYCRR 364 and 372).
- New York State Inactive Hazardous Waste Disposal Sites—Remedy Selection (6 NYCRR 375.10(b)(“At a minimum, the remedy selected shall eliminate or mitigate all significant threats to the public health and to the environment presented by hazardous waste disposed at the site through the proper application of scientific and engineering principles.”).
- New York State Inactive Hazardous Waste Disposal Sites--Interim Remedial Measures (IRMs) (6 NYCRR 375-1.3(n) and 375.1.11)
