Subject: **Submittal of Final Record of Decisions for No Action / No Further Action SWMUs (SEAD-58 and SEAD-63)**
Contract DACA87-02-D-0005, Delivery Order 28
Seneca Army Depot Activity; File No. 1017A

Dear Mr. Nohrstedt:

Parsons Infrastructure & Technology Group Inc. (Parsons) is pleased to submit the Final Record of Decision (ROD) for No Action / No Further Action for SWMUs SEAD-58 and SEAD-63 located at the Seneca Army Depot Activity in Romulus, New York.

The work was performed in accordance with the Scope of Work (SOW) for Task Order 26 and Task Order 28 under Contract DACA87-02-D-0005.

Parsons appreciates the opportunity to provide the Army with this document. Should you have any questions, please do not hesitate to call me at (617) 449-1570 to discuss them.

Sincerely,

Jeffrey Adams
Project Manager

1.0 DECLARATION OF THE RECORD OF DECISION

Site Name and Location

Seneca Army Depot Activity
CERCLIS ID# NY0213820830
NY Site ID: 8-50-006
Romulus, Seneca County, New York

One No Action and one No Further Action Sites:

Debris Area near Booster Station 2131 (SEAD-58) – No Action.
Miscellaneous Components Burial Site (SEAD-63) – No Further Action.

Statement of Basis and Purpose

This decision document presents the U.S. Army's (Army's) and the U.S. Environmental Protection Agency's (USEPA's) selected remedy for SEAD-58 and SEAD-63, located at the former Seneca Army Depot Activity (SEDA or the Depot) in the Towns of Varick and Romulus, New York. The decision was developed in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) as amended, 42 U.S.C. §9601 et seq., and, to the extent practicable, the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), 40 CFR Part 300. The Base Realignment and Closure (BRAC) Environmental Coordinator, the Chief, Alpha Branch, Army BRAC Division, and USEPA Region II have been delegated the authority to approve this Record of Decision (ROD). The New York State Department of Environmental Conservation (NYSDEC) has concurred with the selected remedy.

This ROD is based on the Administrative Record that has been developed in accordance with Section 113(k) of CERCLA. The Administrative Record is available for public review at the Seneca Army Depot Activity, 5786 State Route 96, Building 123, Romulus, NY 14541. The Administrative Record Index identifies each of the items considered during the selection of the remedial action. This index is included in **Appendix A**.

Description of the Selected Remedy

Based on the findings of the investigations and activities completed at the former solid waste management units (SWMUs), the Army has selected No Action (NA) as the remedy for SEAD-58, Debris Area near Booster Station 2131, and No Further Action (NFA) as the remedy for SEAD-63, Miscellaneous Components Burial Site, where a Removal Action was performed. These selections are based on the Army's proposal that these sites do not pose a significant threat to human health or the environment.

State Concurrence

NYSDEC forwarded to USEPA a letter of concurrence regarding the selection of a remedial action in the future. This letter of concurrence has been placed in **Appendix B**.

Declaration

The selected remedies (NA and NFA) are protective of human health and the environment, comply with State and Federal requirements that are legally applicable or relevant and appropriate to the remedial action to the extent practicable, and are cost effective. The remedy uses permanent solutions. Insofar as contamination does not remain at the SWMUs at concentrations above levels that provide for unrestricted use and unlimited exposure, institutional controls and five-year reviews are not necessary.

The foregoing represents the selection of a remedial action by the U.S. Department of the Army and the U.S. Environmental Protection Agency, with the concurrence of the New York State Department of Environmental Conservation.

Concur and recommend for immediate implementation:

2.0 SITE NAME, LOCATION AND DESCRIPTION

SEDA previously was a 10,587-acre military facility located in the Towns of Varick and Romulus in Seneca County, New York, which was owned by the United States Government and operated by the Department of the Army between 1941 and 2000. A location map for SEDA is provided as **Figure 2-1**. As shown in **Figure 2-1**, SEDA is located between Seneca Lake and Cayuga Lake. **Figure 2-1** also shows that SEDA is bordered by New York State Highway 96 to the east and New York State Highway 96A to the west. The center of the Town of Romulus lies to the north of the former Depot's main entrance off Route 96, while Sampson State Park lies to the west and southwest of the Depot. Most of the remaining area surrounding the former Depot consists of sparsely populated farmland. **Figure 2-2** shows the location of SEAD-58 and SEAD-63 at SEDA.

2.1 SEAD-58: Debris Area Near Booster Station 2131

The Debris Area near Booster Station 2131 (SEAD-58), shown in **Figure 2-3**, is located in the west-central portion of the Depot, approximately 325 feet (ft.) northeast of Booster Station 2131. The site has two distinct areas separated by a drainage swale that runs east-west. The larger area, located about 50 ft. north of the drainage swale, is circular and measures approximately 300 ft. in diameter. The smaller area measures approximately 125 ft. by 175 ft. in size and is located just south of the drainage swale.

Topography in the area is very flat with evidence of stressed vegetation and many exposed root systems with underlying growth. The drainage swale makes vehicular access to the south area difficult. A rock wall lines the south side of the swale and is about 2 ft. in height. A small stream runs east-west, south of the smaller area.

The Booster Station 2131 is a pump house used to pump drinking water from the Seneca Lake to the on-site reservoir. Interviews with former SEDA personnel at the time when the "SWMU Classification Report, *Final*" (Parsons, 1994) was prepared indicated that unknown debris and wastes were dumped in this area. These rumors suggested that 4,4'-DDT, a contact insecticide, may have been included in the materials disposed at SEAD-58. The Army has not been able to identify any other information or written record substantiating the rumors of the disposal of 4,4'-DDT at SEAD-58.

2.2 SEAD-63: Miscellaneous Components Burial Site

SEAD-63, shown in **Figure 2-3**, is approximately 480 ft. by 300 ft. in size and is bounded by paved roads on the north, south, and west and by open grassland to the east. The area is undeveloped with vegetation covering much of the ground. In 2004 a removal action was carried out; impacted soil and buried objects were removed, and the area was backfilled with clean soil and returned to the original grade. The topography of SEAD-63 is generally flat with a slight westward slope. Drainage ditches are located adjacent to Patrol Road and the east-west trending roads that bound the site to the north (i.e.,

Service Road 3) and south (unnamed road). A light ground depression, sloping south to north, is located in the northeastern quadrant of the area. Reeder Creek is located south of SEAD-63, flowing west before turning northward and running west of the site with the closest point of the creek approximately 1,500 ft. southwest of the site.

Prior to 2004, the area was mostly undeveloped except for a grass-covered bunker in the southeast corner and an elevated former machine-gun turret constructed of soil in the northwest corner. A noticeable feature within the area was a crushed shale road that entered from Patrol Road and led to a crushed shale pad that measured about 100 ft. by 100 ft. In general, the western half of the area was less vegetated than the eastern side and appeared to have been physically worn by vehicular traffic.

SEAD-63 was used between the 1950s and 1980s as a disposal area for classified parts. During this period, multiple disposal pits were excavated along a north-south line measuring approximately 200 ft. in length. The individual pits measured between 10 ft. and 30 ft. in length and were likely to have been excavated down to the surface of the underlying weathered shale bedrock. SEDA personnel associated with the SWMU prior to the termination of SEDA's military mission identified the types of materials disposed at this site as metal parts. The "SWMU Classification Report, *Final*" (Parsons, 1994) states that "inert materials" were buried within the disposal pits.

3.0 SITE HISTORY AND ENFORCEMENT ACTIVITIES

The SEDA previously occupied approximately 10,600 acres of land located in the Towns of Varick and Romulus in Seneca County, New York. The former military facility was owned by the U.S. Government and operated by the Army between 1941 and approximately 2000, when the SEDA military mission ceased. The SEDA's historic military mission included receipt, storage, distribution, maintenance, and demilitarization of conventional ammunition, explosives and special weapons. In addition, administrative and plant operational facilities were also established in support of the Depot's mission. Waste management was integrated with the SEDA mission. Management of waste materials produced from these operations has been completed in accordance with the requirements of the Resource Conservation and Recovery Act (RCRA).

The USEPA nominated the Depot for inclusion on the National Priorities List (NPL) as a Federal Facility on July 14, 1989; SEDA was officially listed on the NPL on August 30, 1990. Once the SEDA was listed, the Army, USEPA, and NYSDEC identified 57 SWMUs where historic data or information suggested, or evidence existed to support, that hazardous substances or hazardous wastes had been handled and may have possibly been released and migrated into the environment. Each of these sites was identified in the "Federal Facilities Agreement" (USEPA, Army, and NYSDEC, 1993) signed by the three parties in 1993. This list was subsequently expanded to include 72 sites when the Army completed the "SWMU Classification Report, *Final*" (Parsons, 1994), which was required under the terms of the FFA. The SEDA was a Generator and a Treatment, Storage and Disposal Facility (TSDF) and thus subject to regulation under RCRA. Under this permit system, corrective action is required at all SWMUs, if warranted.

Remedial goals are the same for CERCLA and RCRA; thus when the 72 SWMUs were classified in the "SWMU Classification Report, *Final*" (Parsons, 1994), the Army recommended that they be listed either as No Action sites or Areas of Concern (AOCs). SWMUs listed as AOCs in the "SWMU Classification Report, *Final*" (Parsons, 1994) were then scheduled for further investigations based upon data and potential risks to the environment.

In 1995, the SEDA was designated for closure under the Department of Defense's (DoD's) Base Realignment and Closure (BRAC) process. With the SEDA's inclusion on the BRAC list, the Army's emphasis expanded from expediting necessary investigations and remedial actions at prioritized sites to include the conveyance of non-affected portions of the Depot to the surrounding community for their reuse for non-military purposes (i.e., industrial, municipal, and residential). To address employment and economic impacts associated with the SEDA's closure, the Seneca County Board of Supervisors established the Seneca Army Depot Local Redevelopment Authority (LRA) in October 1995. The primary responsibility assigned to the LRA was to prepare a plan for redevelopment of the SEDA property. Following a comprehensive planning process, a *Reuse Plan and Implementation Strategy for Seneca Army Depot* was completed and adopted by the LRA on

October 8, 1996. The Seneca County Board of Supervisors subsequently approved this *Reuse Plan* on October 22, 1996. The designated reuse of the Depot was revised in 2005 by Seneca County Industrial Development Agency (SCIDA) and the current future use model for land at the Depot is reflected in **Figure 3-1**.

Originally, the LRA proposed Conservation/Recreation as the future land use for both SEAD-58 and SEAD-63. As shown in **Figure 3-1**, the current future land use for SEAD-58 is designated as Development Reserve and the current future land use for SEAD-63 is designated as Institutional Training. Both the Development Reserve and the Institutional Training classification suggest that the areas will be used in a manner consistent with light industrial areas.

Since SEDA's inclusion in the DoD's BRAC program, approximately 8,000 acres of land within the former Depot have been released to the community. An additional 250 acres of land was transferred to the U.S. Coast Guard for continued operation of a LORAN Station.

When the "SWMU Classification Report, *Final*" (Parsons, 1994) was issued, SEAD-58 was classified as a Moderately Low Priority AOC, and SEAD-63 was classified as a Low Priority AOC. An Expanded Site Investigation (ESI) was completed at SEAD-58 in 1994 and the ESI report was submitted in 1995. Based on the data collected during the ESI, a mini-risk assessment was performed for SEAD-58 in 2002.

An ESI was also performed at SEAD-63 in 1994. Based on the conclusions of the ESI, a Remedial Investigation/Feasibility Study (RI/FS) was recommended for SEAD-63, and a portion of the field activities associated with the RI were performed in 1997. Based on the results from the investigations, the Army recommended conducting a Non-Time Critical Removal Action (NTCRA) to eliminate impacted soil and remove buried debris at SEAD-63, instead of conducting an FS. The Army's decision was documented in the Action Memorandum and an Engineering Evaluation/Cost Analysis (EE/CA) which is entitled the "Action Memorandum for the Miscellaneous Components Burial Site (SEAD-63), *Final"* (Parsons, 2001).

The NTCRA was performed in 2004 by Plexus Scientific Corporation; impacted soil and buried debris was excavated and disposed off-site at a licensed landfill. The results of the NTCRA were reported in "Final Removal Action Completion Report, Non-Time Critical Removal Action Miscellaneous Components Burial Site (SEAD-63)" (Plexus, 2005). Subsequent to its review of the final completion report, the USEPA required a post-excavation round of groundwater sampling for metal contaminants at SEAD-63. The Army performed and reported the results of this work to the USEPA in July of 2006. Results of the additional groundwater sampling are discussed in Section 6, below. Based on the results of the additional groundwater sampling, the USEPA accepted the Army's determination that the groundwater found at SEAD-63 was not affected by historic activities performed at the site.

Within this ROD, the Army is recommending NA at SEAD-58 and NFA at SEAD-63 as the final step in the CERCLA process required for these sites. Since the listing of SEDA on the NPL in 1990, the Army has worked to develop and prepare the information and data needed to support determinations of what remedial actions are needed at each of the identified SWMUs to ensure that site conditions are protective of human health and the environment, comply with State and Federal requirements that are legally applicable or relevant and appropriate to the remedial action to the extent practical, and are cost effective. Data and information developed and evaluated by the Army that serve as the basis for the final recommendations for SEAD-58 and SEAD-63 are summarized in this ROD. More complete presentations of the data and information that form the basis of the Army's final recommendations for these sites are provided in the Completion Reports submitted per requirements of the FFA listed in the Administrative Record provided as **Appendix A**. This ROD is submitted to fulfill the requirements of the FFA for the Seneca Army Depot Activity.

4.0 COMMUNITY PARTICIPATION

The Army relies on public input to ensure that community concerns are considered in selecting an effective remedy for each Superfund site. To this end, the Completion Reports (e.g., Action Memorandum, ESI report, Removal Action reports, etc.), the Proposed Plan, and associated supporting documentation have been made available to the public during a public comment period, which began on March 6, 2006 and concluded on April 6, 2006. Copies of the Completion Reports, the Proposed Plan, the ROD, and supporting documentation are available at the following repository:

Seneca Army Depot Activity
Building 123
5786 State Route 96
Romulus, NY 14541
(607) 869-1309
Hours are Monday -Thursday 8:30 am to 4:30 pm

During the public comment period, a public meeting was held at Building 123, Seneca Army Depot Activity on April 3, 2006 at 9 a.m. to present the findings and conclusions of the site investigations and remedial actions, to elaborate further on the reasons for recommending the preferred remedial option, and to receive public comments. Comments received at the public meeting, as well as written comments, are documented in the Responsiveness Summary Section of the ROD, **Appendix C**.

In addition, coordination with Native American stakeholders regarding this ROD and the Proposed Plan has been consistent with the programmatic agreements between the State Historic Preservation Office, recognized Native American Tribes, and the Advisory Council for Historic Preservation.

During the BRAC process, monthly presentations were given to the LRA regarding the progress of the sites included in this ROD, as well as other investigations related to the closure of SEDA. In addition, the SEDA Restoration Advisory Board (RAB) was established to facilitate the exchange of information between SEDA and the community. RAB members include the representatives from the Army, USEPA, NYSDEC, and the community.

5.0 SCOPE AND ROLE

The Army has selected NA as the remedy for SEAD-58, the Debris Area near Booster Station 2131, and NFA as the remedy for SEAD-63, the Miscellaneous Components Burial Site, which are addressed in this ROD. The selected remedies at these SWMUs are based on the Army's determination that no residual waste remains at these SWMUs that poses a significant threat to human health or the environment for the foreseeable future use of the property.

6.0 SITE CHARACTERISTICS

6.1 SEAD-58: Debris Area near Booster Station 2131

An ESI of SEAD-58 was performed in 1994. Data collected during the ESI served as the basis of a mini risk assessment that was performed to assess potential risks to likely receptors at the site. Complete analytical results from the ESI and the results of the mini risk assessment are presented in "Decision Document – Mini Risk Assessment SEAD 9, 27, 28, 32, 33, 34, 43, 44A, 44B, 52, 56, 58, 62, 64A, 64B, 64C, 64D, 66, 68, 69, 70, and 120B, *Final*" (Parsons, 2002). A brief summary of the investigation performed is presented below.

Eighteen soil samples, four groundwater samples, and six surface water and sediment samples were collected at SEAD-58 and submitted for chemical analysis during the ESI. All of the samples were analyzed for Target Compound List (TCL) volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticides/polychlorinated biphenyls (PCBs), Target Analyte List (TAL) metals, and cyanide according to the NYSDEC Contract Laboratory Protocol (CLP) Statement of Work (SOW). The analysis of samples for NYSDEC CLP pesticides/polychlorinated biphenyls includes determination of 4,4'-DDT, which was rumored to be disposed at SEAD-58.

A summary of the soil, groundwater, surface water, and sediment results can be found in **Tables 6-1** through **6-4**. The compound 4,4'-DDT had been rumored to have been disposed at SEAD-58. This was a principal reason why this site was originally identified. 4,4'-DDT, however, was not detected in any sample collected during the ESI.

Soil

Eighteen soil samples were collected and analyzed from SEAD-58. Arsenic, copper, magnesium, sodium, and zinc exceeded their respective NYSDEC Technical and Administrative Guidance Memorandum (TAGM) #4046 cleanup objective level values once, while potassium exceeded its TAGM value three times, as shown in **Table 6-1**. The arsenic, copper, sodium, and zinc levels were only slightly greater than their respective TAGM values. Magnesium was detected in sample TP58-1-1 at a depth of 2.5 ft. and at a level that was 1.5 times the TAGM.

Groundwater

Aluminum, iron, and manganese exceeded their respective NYSDEC Class GA Groundwater Standard or USEPA Secondary Drinking Water Regulation (non-enforceable guideline) values in all four of the groundwater samples collected at SEAD-58 (**Table 6-2**). The maximum concentrations of these four metals were detected at MW58-3, which is the furthest downgradient well.

Surface Water

Aluminum and iron were detected at concentrations that exceeded the NYSDEC Ambient Water Quality Standard (AWQS) for Class C surface water (**Table 6-3**) in one or more of the six surface water samples collected at SEAD-58. The aluminum criterion was exceeded in five of the six samples though the only exceedance of significance, 421 µg/L, which was detected at sample location SW58-4-1. The one iron exceedance was detected at this same sample location.

Sediment

Cadmium, chromium, copper, iron, manganese, nickel, and zinc were detected at concentrations that exceeded the NYSDEC Lowest Effective Level criteria (**Table 6-4**) in one of more of the six sediment samples collected from SEAD-58. Cadmium, chromium, and zinc were detected in one sample each at levels slightly greater than their respective criteria. The manganese criterion was exceeded in three of the six samples by less than twice the criteria. Copper and nickel exceeded their criteria in all six samples, though the greatest exceedance for each was slightly more than twice the criterion. Iron was detected at concentrations greater than its criteria in all six samples, though the greatest exceedance was slightly less than 1.5 times the criteria.

6.2 SEAD-63: Miscellaneous Components Burial Site

Work performed at SEAD-63 included a NTCRA in 2004, an ESI in 1994, and an RI in 1997. The NTCRA activities included excavation of impacted soil and buried debris, confirmatory sampling and analysis of soil and groundwater, and backfilling excavated areas with clean soil. The RI activities included sampling and analysis of sediment and surface water, as well as completing a radiological survey. Activities performed during the ESI included test pit excavation and sampling and chemical analysis of soil, groundwater, surface water, and sediment. Data from the ESI and RI were used as the basis of a mini risk assessment that was conducted in 2001 and 2002.

Non-Time Critical Removal Action - 2004

The Army acknowledged that the presence of buried objects at SEAD-63, including some buried components that may have been classified or sensitive, was of potential concern because their nature was unknown. The uncertainty of the nature of the buried material and their potential sensitivity provided the basis for the Army's removal action in 2004. The goal of the proposed NTCRA was to mitigate the source of heavy metals and possible radionuclides through the removal of debris and soils, thereby reducing the chance of further contamination of soils and groundwater at SEAD-63.

Results of the RI, ESI, and the mini risk assessment were combined and presented in an EE/CA as part of an Action Memorandum, which documented the basis of the Army's recommended NTCRA.

Results of the removal action are presented below. Complete analytical results from the NTCRA are presented in "Non-Time Critical Removal Action Miscellaneous Components Burial Site (SEAD-63)," (Plexus, 2005).

The NTCRA was conducted to remove buried debris (mainly military components) and to address cadmium exceedances identified within the burial pits at SEAD-63. As part of the removal action:

- groundwater samples were collected at three overburden monitoring wells on-site;
- debris and fill material were excavated from the burial pits and segregated into three waste streams [classified military parts, four-inch plus material (rock and debris), and four-inch minus material (fill)];
- confirmatory samples were collected and analyzed to ensure that project cleanup goals were achieved;
- excavated material was field screened, sampled and analyzed, and the resulting data were compared to chemical and physical RCRA hazardous waste criteria as well as background radiological levels;
- the site was backfilled and regraded; and
- more than 5,100 tons of solid waste were transported to the Ontario County Landfill for disposal.

Figure 6-1 shows the extent of the excavations performed at SEAD-63, and shows the locations from which final confirmatory soil samples were collected. The largest of the excavations shown on this figure encompasses the area where all of the historic disposal pits were located. This excavation was terminated once native materials or bedrock were encountered.

Soil

The SEAD-63 burial pits were excavated until either native soil or bedrock was observed, as determined by visual inspection. The excavated debris and soil totaling over 5,131 tons were segregated into 4-inch plus (~987 tons) or 4-inch minus (~4,144 tons) material. No radiological sources were identified, and on-site radiological screening and laboratory analyses of the excavated and segregated materials confirmed its classification as non-radioactive, non-RCRA hazardous solid waste.

After the excavation and removal activities were completed, confirmatory soil samples were collected from the perimeter and bottom of the excavation and were analyzed for cadmium. Samples were collected at a rate of one sample per 900 square feet (sf) at the bottom of the excavation and one sample per 30 linear ft. along the excavation sidewalls. Results were compared to the site cleanup goal of 2.3 mg/Kg of cadmium. Confirmatory soil sample results were below the defined site cleanup goal.

All excavated pits were backfilled to original grade with clean soil from SEDA after results were obtained from the laboratory to confirm that the cleanup goal had been achieved. A summary of the confirmatory soil results obtained during the NTCRA is presented in **Table 6-5**.

Groundwater

The three existing overburden monitoring wells located at SEAD-63 were resampled during the NTCRA. Low–flow sampling techniques were used during the NTCRA to minimize suspended solids in the groundwater. The groundwater samples were submitted to the laboratory for radioactivity analysis and compared to NYSDEC AWQS criteria; one sample upgradient of SEAD-63 was collected as background, or reference point. The groundwater analytical results were below groundwater quality criteria and the background results for radioactivity. It was concluded that groundwater is not impacted by site activities and does not require further monitoring.

Based on USEPA comments and requests, the Army also collected samples of groundwater samples from the SEAD-63 site wells in July 2006, and analyzed these samples for metals only. Low-flow purging and sampling techniques and procedures were used to minimize the levels of turbidity in the collected samples. The results of this additional sampling and analysis are presented in **Table 6-6**, where they are compared with state and federal groundwater / water quality standards and guidelines; with the groundwater quality data collected from SEAD-63 during the ESI; and, with Depot-wide background groundwater quality data. Review of this data indicate that while the local groundwater quality found at SEAD-63 exhibits instances where individual chemicals (e.g., aluminum, iron, manganese, and sodium) are detected at levels above state or federal groundwater quality standards or guidelines levels, it is generally consistent with or better than the background groundwater quality found throughout the Depot.

Site Investigations (ESI and RI) – 1994 and 1997

Complete analytical results from the ESI and RI are presented in the EE/CA for SEAD-63 in the "Action Memorandum for the Miscellaneous Components Burial Site (SEAD-63), *Final"* (Parsons, 2001).

Soil

Twelve test pits were excavated at SEAD-63 as part of the ESI in 1994. The excavated material from the test pits included miscellaneous military components and was continuously screened for organic vapors and radioactivity. No readings above background levels were observed during the excavations. The soil analysis results from the test pits indicated that soils were impacted by cadmium in several areas at SEAD-63 (**Table 6-7**). Cadmium concentrations in three test pit samples exceeded the associated TAGM cleanup objective value of 2.3 mg/Kg, with a maximum concentration of 24

mg/Kg. Mercury was detected in one test pit sample (TP63-3) at a concentration of 0.49 mg/Kg, exceeding the TAGM cleanup value of 0.1 mg/Kg. The average concentrations of both cadmium and mercury in SEAD-63 soils exceeded twice the average background concentration for the Depot.

Groundwater

Three monitoring wells were installed and sampled at SEAD-63 during the ESI. Radioactivity analysis results indicated that the groundwater at MW63-3 (located hydraulically downgradient of the disposal pits) may be impacted by gross alpha and gross beta radiation. The level of gross alpha radiation in this well was an order of magnitude above the NYSDEC AWQS Class GA and federal drinking water criteria.

In addition, gross alpha radiation levels exceeded the NYSDEC AWQS in MW63-1, the background location for the purpose of the ESI. Gross beta radiation levels detected in the groundwater samples collected from groundwater monitoring wells MW63-3 and MW63-1 may have been similarly impacted, though the elevated gross beta radiation levels may have been due to the high nephelometric turbidity units (NTUs) found in the groundwater samples. The NYSDEC AWQS for gross beta radiation was not exceeded.

Other constituents detected above their respective criteria values included phenol, iron, manganese, and sodium (**Table 6-8**). Concentrations measured for iron and manganese detected in the SEAD-63 groundwater were generally consistent with their concentrations found at SEDA-specific background wells.

Surface Water/Sediment

Four surface water and sediment samples were collected during the ESI and 18 surface water and sediment samples were collected during the RI.

Results of the investigations indicated that surface water at SEAD-63 has been impacted by SVOCs (**Table 6-9**). Two SVOCs were detected at levels exceeding the NYSDEC AWQS for Class C surface water. One PCB, Aroclor-1260, was detected in three samples at concentrations exceeding its AWQS value of 0.0001 µg/L with a maximum detection of 0.75 µg/L. Two pesticides, heptachlor and heptachlor epoxide, exceeded their respective AWQS values once. In addition, five metals were detected above their respective NYSDEC AWQS Class C surface water.

Radionuclides present in background surface water locations were detected at SEAD-63. In addition, Co-60, Ra-226, Th-230, and U-233/234 were also detected in surface water at SEAD-63. The maximum and average values of the radionuclides detected at SEAD-63 were greater than the maximum and average concentrations found in the background. Gross alpha and gross beta levels

were significantly greater at SEAD-63 in at least one surface water location (SW63-2) than at background locations; however, the elevated levels at SW63-2 are believed to be associated with the high turbidity of this sample. Statistical comparison of the SEAD-63 and background data sets indicates that Ac-227, Ra-222, tritium, U-235, and U-238 were elevated above background.

Sediment sample results indicated that sediments at SEAD-63 had been impacted by polycyclic aromatic hydrocarbons (PAHs) and pesticides at concentrations above their respective NYSDEC guidance values (**Table 6-10**). In addition, eight metals were detected at concentrations greater than their respective Lowest Effect Level guidance values.

All radionuclides detected at SEAD-63, except for Pb-210, were consistent with radionuclides found in background sediment samples. Although the maximum values detected in the SEAD-63 samples exceeded the maximum values of the background samples, average values were comparable. In comparison to the NYSDEC TAGM Cleanup Guideline for Soils Contaminated with Radioactive Material (NYSDEC, 1993), radionuclides distinguishable from background in the sediment do not exhibit a dose equivalent greater than the ten milliRems per year (mrem/yr) cleanup guideline based on residual radioactive (RESRAD) modeling.

Radiological Survey

A radiological survey was conducted at SEAD-63 as part of the 1997 RI. The survey was conducted using an AN/PDR-77 Radiac Set and measured total counts per minute of low energy gamma radiation from the grounds of SEAD-63. Fifty percent of the grounds were covered by the survey as outlined in the RI Project Scoping Plan for SEAD-63. The results of this survey did not indicate that there were any hot spot areas within the grounds of SEAD-63 that required further investigation or an upgrade in classification.

7.0 SUMMARY OF SITE RISKS

Mini risk assessments were conducted at SEAD-58 and SEAD-63 to estimate the risks associated with current and future site conditions. The mini risk assessments estimated the human health and ecological risk that could result from each site if no remedial action were taken.

Human Health Risk Assessment

The reasonable maximum human exposure to chemicals was evaluated. The human health risk assessment methodology is shown in **Figure 7-1**. A four-step process was used for assessing site-related human health risks for a reasonable maximum exposure scenario:

- *Hazard Identification* - identified the contaminants of concern based on several factors such as toxicity, frequency of occurrence, and concentration. This is covered in the Data Collection and Evaluation Box in **Figure 7-1**.

- *Exposure Assessment* - estimated the magnitude of actual and/or potential human exposures, the frequency and duration of these exposures, and the pathways by which humans are potentially exposed. The exposure assessment methodology is shown in **Figure 7-2.**

- *Toxicity Assessment* - determined the types of adverse health effects associated with chemical exposures, and the relationship between magnitude of exposure (dose) and severity of adverse effects (response).

- *Risk Characterization* - summarized and combined the outputs of the exposure and toxicity assessments to provide a quantitative assessment of the related risks (for example, one-in-a-million excess cancer risk).

The risk analysis performed for SEAD-63 was performed in 2001 and 2002. The risk analysis performed for SEAD-58 was completed in 2002. As such, the receptors evaluated in the risk assessments were selected based on the intended future land use assigned to the area by the LRA at that time. Both SWMUs are located in the portion of the former Depot that was previously (between 1996 – 2005) designated for Conservation/Recreation uses. The SCIDA revised its planned future land use for the Depot in 2005 and the new future land uses for SEAD-58 and SEAD-63 are Development Reserve and Institutional Training, respectively. The current planned future land use at the Depot is displayed in **Figure 3-1**.

Conservation/Recreation land use requires the application of more stringent cleanup levels than does either the Development Reserve or the Institutional Training uses, which are suggestive of more commercialized/industrialized land use applications. Similarly, the receptors and exposure

assumptions used under the former Conservation/Recreation use scenario are more restrictive and stringent, and are considered more conservative than are the receptors and exposure assumptions normally evaluated for industrialized/commercialized use scenarios. Nevertheless, since the results of the original risk assessments indicate that the sites are suitable for release as Conservation/Recreation property, these results can be used to support the Army's recommendation that the SEAD-58 and SEAD-63 sites can be released for use as Development Reserve and Institutional Training sites, respectively. The following receptors for the Conservation/Recreation scenario were evaluated:

1. Future park worker,
2. Future recreational visitor (child), and
3. Future construction worker.

The mini risk assessments addressed the potential risks to human health by identifying several potential exposure pathways by which the public may be exposed to contaminant releases at the site under current and future land use scenarios. **Figures 7-3** show the exposure pathways considered for the Conservation/Recreation scenario.

The exposure pathways evaluated also reflect the SCIDA's prior projected future use (i.e., Conservation/Recreation) for each area. The following exposure pathways were considered:

1. Inhalation of particulate matter in ambient air (all future receptors);
2. Ingestion and dermal contact to on-site surface soils (all future receptors);
3. Ingestion and dermal contact to on-site surface and subsurface soils (future on-site construction worker);
4. Dermal contact to surface water while wading (future park worker and recreational visitor child); and,
5. Dermal contact to sediment (future park worker and recreational visitor - child).

In addition, risks to residential receptors (i.e., adult resident, child resident and lifetime resident) were evaluated for SEAD-63. The following exposure pathways were evaluated for these receptors:

1. Inhalation of particulate matter in ambient air;
2. Ingestion and dermal contact to on-site surface soils;
3. Ingestion of groundwater (daily);
4. Dermal contact to groundwater;
5. Dermal contact to surface water; and,
6. Dermal contact to sediment.

Under current USEPA guidelines, the likelihood of carcinogenic and non-carcinogenic effects due to exposure to site-related contaminants are considered separately. Non-carcinogenic risks were

assessed by calculation of a Hazard Index (HI), which is an expression of the chronic daily intake of a contaminant divided by its safe or Reference Dose (RfD). A HI that exceeds 1.0 indicates the potential for non-carcinogenic effects to occur. Carcinogenic risks were evaluated using a cancer Slope Factor (SF), which is a measure of the cancer-causing potential of a chemical. Slope Factors are multiplied by daily intake estimates to generate an upper-bound estimate of excess lifetime cancer risk. For known or suspected carcinogens, USEPA has established an acceptable cancer risk range of 10^{-4} to 10^{-6} (one-in-ten thousand to one-in-one million).

Ecological Risk Assessment

The reasonable maximum environmental exposure was evaluated in a mini risk assessment for SEAD-58 (Parsons, 2002) and SEAD-63 (Parsons, 2001). A four-step process was used for assessing site-related ecological risks for a reasonable maximum exposure scenario:

- *Characterization of the Unit and the Ecological Communities it May Affect*—Includes ecological conditions observed at the unit, site habitat characterization, wildlife resources that are present in the area, and ecological resource values to wildlife and to humans. Ecological receptors identified at this step for the above sites include deer mouse, short-tailed shrew, American robin, and morning dove (SEAD-63 only).

- *Exposure Assessment*—Describes chemicals of potential concern (COPCs), EPC, and exposure assessments. COPC distribution at the site and its uptake through various pathways are also discussed in this section. Daily intakes of COPCs through environmental media are quantified as well.

- *Toxicity Assessment*—Assesses ecological effects that potentially may result from receptor exposure to COPCs. Evaluates potential toxicity of each COPC in each medium and defines toxicity benchmark values that will be used to calculate the ecological quotient (EQ).

- *Risk Characterization*—Integrates the results of the preceding assessment elements. It estimates risk with respect to the assessment endpoints, based on the predicted exposure to and toxicity of each COPC.

Ecological risk was presented in terms of an EQ, which is derived from the results of the exposure quantification and the toxicity assessment for each COPC. The EQs are based on relevant measurement endpoints and are indicative of the potential for each chemical to pose an ecological risk to receptors. Step 2 of the screening-level exposure estimate and risk calculation in "Ecological Risk Assessment Guidance for Superfund (ERAGS): Process for Designing and Conducting Ecological Risk Assessments" (USEPA, 1997) suggests that EQs less than or equal to 1 present no probable risk. EQs between 1 and 10 present a small potential for environmental effects, EQs between 10 and 100

present a significant potential that effects could result from greater exposure, and EQs greater than 100 indicate the highest potential for expected effects.

The following sections present a summary of human health and ecological risks posed by contaminants at the Sites.

7.1 SEAD-58

A mini risk assessment was conducted to estimate the risks associated with current and future site conditions. A mini risk assessment is a conservative, screening risk assessment tool used to assess the human health and ecological risk that could result from the site if no remedial action were taken. Maximum site concentrations were used as the exposure point concentrations (EPCs). Due to the conservative nature of the mini risk assessment, it is likely that a more traditional risk assessment would estimate lower risks.

The mini risk completed for SEAD-58 was performed in 2002, and considered receptors expected to use the site based on its planned future use documented then, which was as Conservation/Recreation land. In 2005, the SCIDA revised its planned future use to Development Reserve, which would require a less rigorous cleanup as recontamination is more likely to occur due to future operations. Nevertheless, since the 2002 risk assessment results indicate that the site is suitable for release anticipating a more restrictive future use, the 2002 results are used to support the Army's recommendation that the site is suitable for a NA determination.

The receptors used in the 2002 risk assessment were a park worker, a recreational visitor – child, and a construction worker. The following exposure pathways were evaluated: inhalation of dust, ingestion of soil, and dermal contact to soil, surface water, and sediment.

The total cancer risk from all exposure routes was below the USEPA acceptable level for all three receptors. The total non-cancer HI from all exposure routes was less than 1.0 for all three receptors. A summary of the mini risk assessment results can be found in **Table 7-1** at the end of this report.

An ecological risk assessment was conducted with SEAD-58. All COPCs had EQs less than 1 for all receptors except for the American Robin exposed to bis(2-ethylhexyl)phthalate. Bis(2-ethylhexyl)phthalate is a common laboratory contaminant and therefore the detected concentrations may not necessarily be associated with site conditions. The average bis(2-ethylhexyl)phthalate concentration at SEAD-58 does not pose significant risk to potential ecological receptors. Based on the above discussion, it was concluded that SEAD-58 would not pose significant risk to potential ecological receptors; thus, no significant ecological risks were identified at SEAD-58. The complete assessment can be found in "Decision Document for Various "No Action" Sites- Mini Risk Assessments, *Final*" {Parsons, 2002).

Based on the results of the mini risk assessment, no remedial action is necessary to ensure protection of human health or the environment.

7.2 SEAD-63

A risk analysis was completed for SEAD-63 in 2001 and 2002, and considered receptors expected to use the site based on its planned use documented then, which was Conservation/Recreational land. In 2005, the SCIDA revised its planned future use at SEAD-63 to Institutional Training, which would require a less rigorous cleanup as recontamination is more likely to occur due to future operations. Nevertheless, since the prior risk assessment results indicate that the site is suitable for release anticipating a more restrictive use; these results are used to support the Army's recommendation that the site is suitable for a NFA recommendation.

The receptors evaluated in the 2001/2002 risk assessment were a park worker, a recreational visitor – child, and a construction worker. The following exposure pathways were evaluated: inhalation of dust; ingestion of soil; dermal contact to soil, groundwater, surface water, and sediment; and ingestion of groundwater.

The results of the SEAD-63 risk assessment are shown in **Table 7-2**. All non-cancer risks were less than 1.0, with HIs for the park worker, recreational visitor – child, and construction worker of 0.2, 0.4, and 0.3, respectively. Cancer risks for the three receptors were within USEPA acceptable range of 10^{-4} to 10^{-6}. Cancer risk values for the park worker, recreational visitor – child, and construction worker were $5x10^{-5}$, $8x10^{-5}$, and $8x10^{-8}$, respectively. Each of these is within the USEPA recommended range of acceptable risk.

For comparison purposes, risk to a future resident was also evaluated. The non-cancer risk to a resident adult was less than 1, while the non-cancer risk to a resident child had a HI of 2.0. The total lifetime cancer risk for a resident was $1x10^{-4}$, which is at the upper limit of USEPA's normal acceptance range (10^{-4} to 10^{-6}). A summary of the risk assessment results is presented in **Table 7-2** of this report.

The predominant contributor to the resident child's elevated HI is manganese through ingestion of groundwater. However, the concentration of manganese contained in the groundwater in the vicinity of SEAD-63, and that which was used for the mini-risk calculations, is consistent with SEDA-specific background groundwater quality for this compound as is shown in the data presented in **Table 6-6**, which was discussed above in Section 6.2.

The elevated lifetime resident's cancer risk at SEAD-63 results primarily from the presence of PAHs in surface water samples collected from the drainage ditches and culverts surrounding the site during

the ESI. Generally, PAHs are not very soluble in surface water, so their presence in the surface water samples collected during the ESI is presumed to result from their association with entrained soil particles and particulates carried by storm-event run-off flow into the man-made drainage culverts and infiltration galleries that surround the site. Once carried into the drainage ditches and infiltration galleries, the Army presumes that the soil particles are deposited with the surface soil and sediment that underlie the ditches and culverts. As sediments or surface soil, the probable contribution of the PAHs to the lifetime resident's cancer risk is significantly reduced, as is indicated resident's lifetime dermal exposure to sediment (i.e., $4x10^{-6}$) and soil ($1x10^{-8}$) or the ingestion of soil ($3x10^{-7}$).

The drainage ditches and infiltration galleries located closest to SEAD-63, where the ESI surface water and sediment samples were collected were excavated and the sediment removed as part of the removal action. These culverts and ditches were also graded to promote surface water drainage away from the site. Storm-event surface water flow will continue to be intermittent around SEAD-63. However, the Army believes that the resident's lifetime cancer risk at the site is best characterized by the exposure to site soils or sediment because these are less variable, and not associated with PAHs in surface water.

An ecological risk assessment was completed at SEAD-63 in 2001, and hazard quotients (HQs) calculated for seven SVOCs indicated that potential risks may exist for selected mammalian and avian species. A closer review of these data indicated that the potential threats were due to isolated hot spots of SVOC-impacted soil located in the drainage ditches, which could be addressed during the proposed removal action. A NTCRA at SEAD-63 was performed by Plexus Scientific Corporation in 2004, which included the removal of the top 6-inches of soil in the drainage ditches. The removal of impacted soil from the ditches eliminated the potential risk to the environment identified in the mini risk assessment.

The purpose of the NTCRA performed at SEAD-63 was to mitigate the source of heavy metals and possible radionuclides through the removal of debris and soils, thereby reducing the chance of further degradation of soils and groundwater at the site. Although site conditions prior to the NTCRA did not pose a human health risk based on the results of a mini-risk assessment, the presence of buried objects, such as drums, was of concern, since the nature of the drum contents was unknown. Furthermore, some buried components deposited at SEAD-63 may have contained classified or sensitive material that would need to be examined by appropriate military personnel for evaluation and declassification. The uncertainty of the nature of the buried components and the sensitivity of the materials that may have remained in the disposal area was considered justification for performing the removal action at the site. While removal and control of the military items buried at the site was the primary focus of the removal action, soil contamination present at the site surrounding these items was also addressed by the action. Additionally, elevated levels of PAHs in soils and sediments were addressed through isolated hot spot removals. Based upon the results from the NTCRA the source of

any potential ecological risk was removed from SEAD-63, and thus, no further remedial action is necessary to ensure protection of human health or the environment.

8.0 SELECTED REMEDY

Based on the results of the investigations and mini risk assessments completed for the sites, the Army has selected NA at SEAD-58 and NFA at SEAD-63.

8.1 No Action Site

Based on the findings of the investigation and mini risk assessment completed for SEAD-58, the Army has selected NA as the remedy for SEAD-58. This selection is based on the Army's determination that SEAD-58 does not pose a significant threat to human health or the environment.

8.2 No Further Action Site

Based on the findings of the investigations and the completion of the Removal Action, the Army has selected NFA as the remedy for SEAD-63. This selection is based on the Army's determination that SEAD-63 does not pose a significant threat to human health or the environment.

NOTES:

5.80 - Blue-colored value indicates exceedance of the higher of New York State Department of Environmental Conservation (NYSDEC) TAGM soil cleanup goal or Seneca Army Depot Activity (SEDA) background

1.4 - Gray-shading indicates Practical Quantitation Limit (PQL) exceeds cleanup goal

* NYSDEC TAGM soil cleanup goal for total (m,p,o)-Xylenes is 1,200 µg/Kg
** 1,000 µg/Kg for surface soil, 10,000 µg/Kg for subsurface soil
*** NYSDEC TAGM soil cleanup goal for total Chlordane is 540 µg/Kg
**** Value indicated, and total SVOCs <500,000 µg/Kg
***** Value for total 1,2-dicchloroethenes

"MDL" means Minimum Detection Limit
"TAGM" means Technical and Administrative Guidance Memorandum #4046 - Determination of Soil Cleanup Objectives and Cleanup Goals (NYSDEC)
"µg/Kg" means micrograms/Kilogram
"mg/Kg" means milligrams/Kilogram
"SB" means Site Background
"N/A" means Not Applicable (NYSDEC TAGM criterion)
"J" is a Quality Control (QC) qualifier indicating detection below PQL
"u" is a QC qualifier indicating the compound was Not Detected, or ND, at or above the MDL
"R" is a QC qualifier tagged by the Data Validator indicating a Relative Percent Difference (RPD) outside accepted recovery limits

Notes

(1) GA = New York State GA Groundwater Standards
MCL = Federal Maximum Contaminant Level
SEC = Federal Secondary Drinking Water Regulation guidance values

(2) Data validated in accordance with Region II procedures

(3) Data validated by laboratory only.

Shaded and bolded data exceed groundwater quality standard / guideline identified.

Data Qualifiers

<Null>	Compound detected at concentration reported.
J	Compound positively identified at the estimated concentration reported.
U	Compound not detected at concentration indicated.
B	Compound was detected in the blank as well as in the sample.

Re: Seneca Army Depot Activity
Site No. 850006
Draft Record of Decision
For SWMUs SEAD-58 & SEAD-63

Dear Mr. Pavlou:

The New York State Department of Environmental Conservation and the New York State Department of Health have reviewed the above referenced ROD. The State concurs with the selected remedy as stated in the draft ROD of August 2006.

If you have any questions, please contact Dr. Chittibabu Vasudevan at (518) 402-9625.

Sincerely,

Dale A. Desnoyers
Director
Division of Environmental Remediation

APPENDIX C

RESPONSIVENESS SUMMARY AND PUBLIC COMMENTS

APPENDIX C

PUBLIC COMMENTS AND RESPONSIVENESS SUMMARY

DEBRIS AREA NEAR BOOSTER STATION 2131 (SEAD-58) AND MISCELLANEOUS COMPONENTS BURIAL SITE (SEAD-63)

SENECA ARMY DEPOT SUPERFUND SITE
CERCLIS Site ID: NYS0213820830
NYS Site ID: 8-50-006

INTRODUCTION

A responsiveness summary is required by Superfund policy. It provides a summary of citizen's comments and concerns received during the public comment period, and the Army's responses to those comments and concerns.

OVERVIEW

Since the inception of this project, the Army has implemented an active policy of involvement with the local community. This involvement has occurred through the public forum provided by regular meetings of the Base Cleanup Team (BCT). During these meetings, representatives of the community, the Army and the regulators are brought together in a forum where ideas and concerns are voiced and addressed. The BCT has been routinely briefed by the Army in regards to the progress and the results obtained during both the investigation and remedial alternative selection process. In addition to regular project specific briefings, the Army has provided experts in various fields related to the CERCLA program that have provided lectures intended to educate the general public in the various technical aspects of the CERCLA program at SEDA. Lectures have been conducted on risk assessments, both human health and ecological, remedial alternatives, such as bioventing and natural attenuation, institutional controls, and the feasibility study process.

BACKGROUND ON COMMUNITY INVOLVEMENT

Initially, during the years from 1991 through 1995 the Army solicited community involvement through quarterly meetings with the Technical Review Committee (TRC). The TRC was formed by the Army and comprised of community leaders with an active interest in the on-goings of the CERCLA process at the Depot. These meetings were open to the public and were announced in the local newspaper and the radio. Following inclusion of the depot on the final BRAC closure list in late 1995, the Army transitioned from the TRC and formed the BCT. The BCT was comprised of several of the TRC members with the addition of additional Army and regulatory representatives. The BCT increased the frequency of the meetings to a monthly basis. Since the formation of the TRC and the

BCT, the Army has met with the local community members on a regular basis and has discussed the finding of the completion reports. In addition, the Proposed Plan has been presented to the BCT.

SUMMARY OF COMMUNITY RELATIONS ACTIVITIES

The SWMU Classification Report, the BRAC 95 Program Environmental Baseline Survey Report, the two Expanded Site Investigation reports, the Decision Document containing the Mini-Risk Assessment for SEAD-58, the Action Memorandum and the Completion Report for SEAD-63, and the Proposed Plan for the two sites have been released to the public for comment. These documents were made available to the public in the administrative record file at the information repositories at Building 123 within the Seneca Army Depot Activity, 5786 State Route 96, Romulus, New York, 14541-5001. The notice of availability for the above-referenced documents was published in the Finger Lake Times on March 7, 2006. The public comment period on these documents was held from March 6, 2006 to April 6, 2006.

On April 3, 2006, the Army, USEPA and NYSDEC conducted a public meeting at the Seneca Army Depot, Building 123, in Romulus, NY to inform local officials and interested citizens about the Superfund process, to review current and planned remedial activities at the Site, and to respond to any questions from area residents and other attendees. The meeting included presentations and provided an opportunity for the public to speak to the Army, USEPA and NYSDEC representatives involved in the process. The public was given the opportunity to provide formal comments that would be documented and become part of the official record for the selected remedy.

SUMMARY OF COMMENTS AND RESPONSES

No formal comments were received from the community during the public meeting. There is no official transcript since no comments were provided. In addition, no formal comments were received from the community during the public meeting.
